

### Description

NEC's CMOS-6 gate array families (CMOS-6, CMOS-6A, CMOS-6V and CMOS-6X) are ultra-high performance, sub-micron effective channel length CMOS products created for high-integration ASIC applications.

The device processing includes 1.0-micron (drawn) silicon-gate CMOS technology and three-layer (CMOS-6) and two-layer (CMOS-6A, CMOS-6V, CMOS-6X) metallization. This technology features channelless (sea-of-gates) architecture in densities from 1,200 to 177,408 equivalent gates, with an internal gate delay of 270 ps ( $F/O=1$ ;  $L=0$ ). Output drive is variable to 18 mA. Slew rate buffers are also available.

CMOS-6 products are fully supported by NEC's advanced ASIC design technology. NEC's OpenCAD® integration system lets the designer choose the most powerful design tools and services available. The CMOS-6/6A/6V macro cell (block) library is compatible with the powerful CMOS-5 block library, which contain over 300 cells and more than 100 interface options.

NEC offers advanced packaging solutions with both through-hole and surface-mount ceramic PGAs and flat packages. These heat-sink-equipped packages give CMOS-6 devices the performance edge in high-integration applications.

### Features

- Channelless, 1.0 μm CMOS high-density architecture
- Variable output drive: 4.5, 9.0, 13.5, or 18.0 mA
- Slew rate output buffers
- Free size memory blocks to 64 Kbytes (16K x 4, μPD65676)
- Powerful block library with more than 400 macros
- 3V characterized block library
- New 0.65 mm 184-pin plastic QFP for cost effective designs
- High I/O to gate ratio for CMOS-6V and CMOS-6X

Actual gate utilization may vary depending on circuit implementation.

Utilization is 75% for three-layer metal; 70% for two-layer metal.

Memory utilization is determined by 50% x available gates + (utilization x 50% available gates)

Depending on package and circuit specification, some pads are used for  $V_{DD}$  and GND and are unavailable as signal pads.

### Circuit Architecture

CMOS-6 products are built with NEC's 1-micron channelless architecture. As shown in figure 2, CMOS gate array chips are divided into I/O and internal cell areas. The I/O cell area contains input and output buffers that isolate the internal cells from high-energy external signals. The internal cell area is an array of basic cells, each composed of two p-channel MOS transistors and two n-channel MOS transistors, as well as four additional n-channel MOS transistors for compact RAM design. A cell configured as a two-input NAND gate is shown in figure 3. These p-channel and n-channel transistors are sized to offer a superb ratio of speed to silicon area.

### Output Slew Rate Selection

Fast rise and fall times of CMOS output buffers can cause system noise and signal overshoot. When an unterminated line is being driven by a buffer, the maximum line length is determined by the rise and fall time of the output buffers and the round-trip signal delay of the line.

As a general rule, the round-trip delay of the line should not exceed the rise or fall time of the driving signal. Transmission lines that are longer than those determined by the above rule can cause system performance degradation because of reflections and ringing. One benefit of slew rate output buffers is that longer interconnections on a PC board (and routing flexibility) are possible with slew rate output buffers.

The ASIC designer can slow down the output edge rate by selecting the slew rate output buffer and thus allowing for a longer line.

Also, as the slew rate buffers inject less noise than their non-slew rate counterparts into the internal power and ground busses of the devices, the slew rate buffers require fewer power pairs for simultaneous switching outputs.

### Absolute Maximum Ratings

Power supply voltage, $V_{DD}$	-0.5 to +6.5 V
Input/output voltage, $V_I / V_O$	-0.5 V to $V_{DD} + 0.5$ V
Latch-up current, $I_{LATCH}$	>1 A (typ)
Output current, $I_O$	
4.5-mA drive	10 mA
9-mA drive	20 mA
13.5-mA drive	30 mA
18-mA drive	40 mA
Operating temperature, $T_{OPT}$	-40 to +85°C
Storage temperature, $T_{STG}$	-65 to +150°C

**Caution:** Exposure to absolute maximum ratings for extended periods may affect device reliability; exceeding the ratings could cause permanent damage. The device should not be operated outside the recommended operating conditions.

The new 184-pin 0.65 mm QFP shown above is ideal for PC integrated chipsets. The package is available with a copper leadframe thereby allowing greater heat dissipation than standard 42 alloy leadframe packages. The 0.65 mm pin pitch allows the use of widely available, cost effective assembly equipment. It is currently available in two masterslices. The  $\mu$ PD65658 with 25,344 usable gates and the  $\mu$ PD65664 with 43,545 usable gates.

### NEC's ASIC Design System

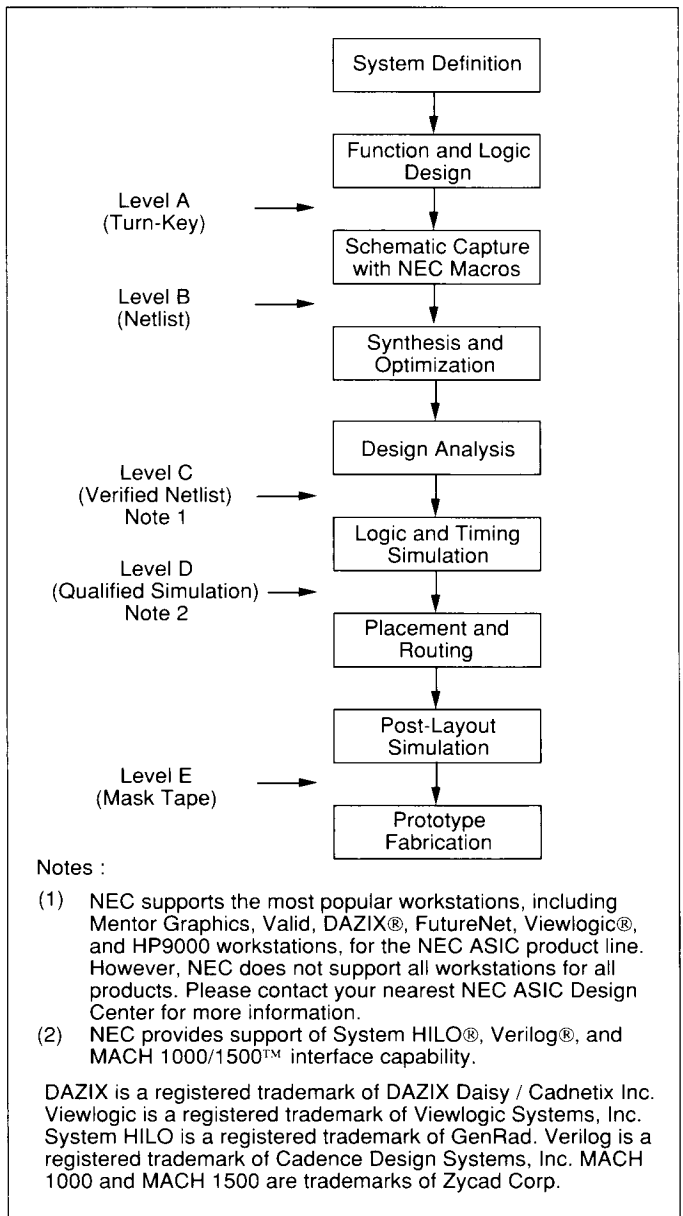

CMOS-6/6A/6V gate arrays are fully supported by NEC's network of ASIC Design Centers, listed on the back of this data sheet.

Design flow for CMOS-6/6A/6V gate arrays is shown in figure 4. Users can enlist Design Center support at any step in the design flow before actual manufacturing. Figure 4 shows the various levels at which Design Center support may begin — anywhere from level A through level E. Level C, "Verified Netlist," is the most popular interface.

NEC supports its ASIC products with a comprehensive CAD system that significantly reduces the time and expense usually associated with the development of semi-custom devices. NEC's OpenCAD integration system supports tools for floorplanning, logic synthesis, automatic test generation, accelerated fault grading and full timing simulation, and advanced place-and-route algorithms. These advanced CAD tools ensure accurate designs.

Sample design kits are available at no charge to qualified users: contact an NEC ASIC Design Center for more information. (Software licensing required—NEC reserves the right to prioritize support based on user requirements.)

**Block Library List**

The CMOS-6 families offer a variety of blocks, including gates, flip-flop circuits, and shift registers. The functions of these blocks are designed to be compatible with those of the CMOS-4 and CMOS-5 families.

In addition, such memory blocks as RAM and ROM and low-power gates are provided. The low-power block, in particular, was designed with low fan-out taken into consideration; the number of cells is less than that of the standard block, contributing to low power consumption and high efficiency.
