ES9039MPRO & ES9039PRO

32-bit High-Performance 8-Channel DAC

Product Datasheet

The ESS Sabre® ES9039MPRO & ES9039PRO are the fully redesigned flagship 32-bit 8 Channel digital-to-analog converters (DAC) that target high end consumer devices, professional audio applications such as recording systems, mixer consoles and digital audio workstations (DAW), test equipment, instruments, audio processors applications. It was designed to create the new generation of the world's highest performing audio DAC.

The ES9039PRO has 8 integrated DACs which use ESS' patented Hyperstream® IV DAC Architecture. Using the QUAD modulator architecture, it delivers unprecedented audio sound quality and specifications, including a world class +132dB DNR per channel, +140dB DNR and a THD+N of -122dB in mono mode.

The ES9039PRO SABRE® DAC improves on previous designs to include:

- MQA Hardware renderer (ES9039MPRO) to reveal the original master resolution
- TDM & SPI support for more options in connectivity
- Lower power consumption than previous generations, including the Hyperstream IV DAC modulator
- New Hardware mode for simplified programming.

TDM, DSD, DoP, and I2S, LJ, RJ master/slave interfaces as well as synchronous S/PDIF are supported.

The ES9039PRO has 7 built-in pre-programmed and programmable digital filters which allows the most discerning user to tune the SABRE sound to their own personal sound signature.

The ES9039MPRO includes a built-in stereo hardware MQA renderer that helps recreate the natural sound of the recording.

FEATURE	DESCRIPTION
Patented 32-bit HyperStream® IV Architecture DAC Technology	32-bit audio DAC with ultra high dynamic range & ultra-low distortion
+140dB DNR mono mode +132db DNR per channel -122dB THD+N mono	Unprecedented dynamic range and ultra-low distortion
MQA Renderer (ES9039MPRO only)	Stereo MQA Renderer Built-In Easily paired with software MQA core decoder Eliminates the need for complicated DAC filter tuning
High Sample Rates	Up to PCM 768kHz & native DSD1024
Customizable filter characteristics	7 presets of digital optimal filters, with custom filter programmability for each channel to allow for a unique sound signature
Multiple Input formats are available	I2S, LJ, RJ, TDM, DSD, DoP and S/PDIF
I2C, SPI, and Hardware interface control	Configured by microcontroller or other I2C/SPI source, or pins through Hardware Mode
Lower Power Consumption than Previous Gen	Simplifies power supply design
Standardized Packaging	10mm x 10mm, 64 pin eTQFP for reduced PCB board space

APPLICATIONS

- Professional digital audio workstations (DAW) Audio Playback
- A/V Receivers
- Personal Audio Devices & Media Streamers
- High End Audiophile Equipment
- Any equipment that requires the very best audio digital to analog conversion

ES9039MPRO & ES9039PRO Datasheet

Feature List

The ES9039(M)PRO are SABRE 8 channel Flagship performance digital to analog converters (DAC) with features and performance including the new Hyperstream IV modulator that produces a device that is well suited for all Audiophile and PRO Audio applications.

These features include TDM & SPI support as well as a Hardware (HW) mode for simplifying configuration of the ES9039PRO. The ES9039MPRO includes a built in MQA renderer.

TDM / I2S / LJ / RJ / DSD / DoP interfaces are supported.

Sample rates up to 768kHz with PCM data and 7 selectable build-in digital filters as well as programmable filters. DSD rates up to DSD1024 are supported as well.

Configuration Modes

The ES9039PRO/ES9039MPRO have 4 control programming modes. They are controlled by the state of the MODE (pin 23):

MODE PIN	Configuration
0	I ² C interface
Pull Low	HW control mode (see Hardware Mode Table)
Pull High	HW control mode (see Hardware Mode Table)
1	SPI interface

Software Mode

To configure the ES9039MPRO & ES9039PRO registers manually over I²C or SPI, connect the following pins:

I²C

- MODE (Pin 23) – **GND**
- Connect per I²C standard
 - SDA (Pin 21)
 - SCL (Pin 22)
 - ADDR0 (Pin 41)
 - ADDR1 (Pin 40)

Available I2C Addresses for the ES9039(M)PRO:

I2C Address	ADDR1	ADDR0
0x90	GND	GND
0x92	GND	AVDD
0x94	AVDD	GND
0x96	AVDD	AVDD

Table 1 – I2C address configurations

SPI

- Mode (Pin 23) – **AVDD**
- Connect per SPI standard
 - MOSI (Pin 21)
 - SCLK (Pin 22)
 - SS (Pin 40)
 - MISO (Pin 41)

Hardware Mode

The ES9039MPRO & ES9039PRO has 32 pre-configured modes that can be set with external pin configuration. These modes configure the DAC for different input serial data rates and set the DAC muting.

These modes are set with pins:

- MODE (Pin 23)
- HW0 (Pin 21)
- HW1 (Pin 22)
- HW2 (Pin 40)
- MUTE_CTRL (Pin 41)

Each hardware mode pin has 4 states:

- 0 – Pin directly connected to GND
- 1 – Pin directly connected to AVDD
- Pull 0 – Pin pulled to GND through 47kΩ resistor
- Pull 1 – Pin pulled to AVDD through 47kΩ resistor

Design Information

Each hardware mode pin can be configured with either a pull-up or pull-down resistor. Therefore, it is important that the pin is configured to allow for the desired hardware modes. Some guidelines include the following:

- The HW0 and HW1 pins never require a pull up or pull-down resistor.

Figure 2 – Hardware mode pin configurations

Muting

MUTE_CTRL (Pin 41) is used to control the muting of the output and enabling of the Automute feature while in Hardware Mode:

- 0 – Output Muted, No Automute
- 1 – Output Unmuted, No Automute
- Pull 0 – Output Muted, Automute Enabled
- Pull 1 – Output Unmuted, Automute Enabled

Audio Input Formats

For configuring TDM, I2S, DSD, use Registers 57-71

Time-division multiplexing (TDM)

The ES9039(M)PRO supports up to 32 channel TDM modes. Application Note regarding setup for TDM will be available soon.

Note: There is no internal DSD channel mapping, DSD data must be physically connected to each pin DATA1-DATA8.

Pre-Programmed Digital Filters

The ES9039MPRO & ES9039PRO has 7 pre-programmed digital filters. The latency for each filter reduces (scales) with increasing sample rates. (See Register 88[2:0])

- Minimum Phase (default)
- Linear Phase Apodizing
- Linear Phase Fast Roll-off
- Linear Phase Slow Roll-off
- Minimum Phase Fast Roll-off
- Minimum Phase Slow Roll-off
- Minimum Phase Slow Roll-off Low Dispersion

PCM Filter Latency

The following table shows the simulated latency of each filter at 48kHz sampling rate. Latency delay will reduce (scale) with sampling rate.

Digital Filter	Delay(us) @ fs=48kHz
Minimum phase (default)	158us
Linear Phase Apodizing	760us
Linear Phase Fast Roll-Off	771us
Linear Phase Slow Roll-Off	208us
Minimum Phase fast roll-off	158us
Minimum Phase slow roll-off	137us
Minimum Phase Slow roll-off low dispersion	282us

Register Overview

I²C Slave Interface (Device Address 0x90, 0x92, 0x94, 0x96)

This interface contains Read/Write and Read-only registers. A system clock must be present.

Multi-byte registers must be written from LSB to MSB. Data is latched when MSB is written.

Multi-byte registers must be read from LSB to MSB. Data is latched when LSB is read.

MSB is always stored in the highest register address.

Read/Write Register Addresses

Registers 0-130 (0x00 – 0x82) are read/write registers

Read-only Register Addresses

Registers 224 – 249 (0xE0 – 0xF9) are read only registers.

Multi-Byte Registers

Multi-byte registers must be written from LSB to MSB. Data is latched when MSB is written.

MSB is always stored in the highest register address.

SPI Slave Interface

The SPI slave interface is used when the MODE pin (pin 23) is pulled high.

- The SPI Slave interface can be accessed using the Pins 21,16,30,31
 - Pin 21 MOSI
 - Pin 22 SCLK
 - Pin 40 SS
 - Pin 41 MISO

The 4-wire SPI data format is: Command (1 byte) + Address (1 byte) + Data

Reflow Process Considerations

Temperature Controlled

For lead-free soldering, the characterization and optimization of the reflow process is the most important factor to consider.

The lead-free alloy solder has a melting point of 217°C. This alloy requires a minimum reflow temperature of 235°C to ensure good wetting. The maximum reflow temperature is in the 245°C to 260°C range, depending on the package size ([RPC-2 Pb-Free Process – Classification Temperatures \(T_c\)](#)). This narrows the process window for lead-free soldering to 10°C to 20°C.

The increase in peak reflow temperature in combination with the narrow process window makes the development of an optimal reflow profile a critical factor for ensuring a successful lead-free assembly process. The major factors contributing to the development of an optimal thermal profile are the size and weight of the assembly, the density of the components, the mix of large and small components, and the paste chemistry being used. Reflow profiling needs to be performed by attaching calibrated thermocouples well adhered to the device as well as other critical locations on the board to ensure that all components are heated to temperatures above the minimum reflow temperatures and that smaller components do not exceed the maximum temperature limits (Table RPC-2).

To ensure that all packages can be successfully and reliably assembled, the reflow profiles studied and recommended by ESS are based on the JEDEC/IPC standard J-STD-020 revision D.1.

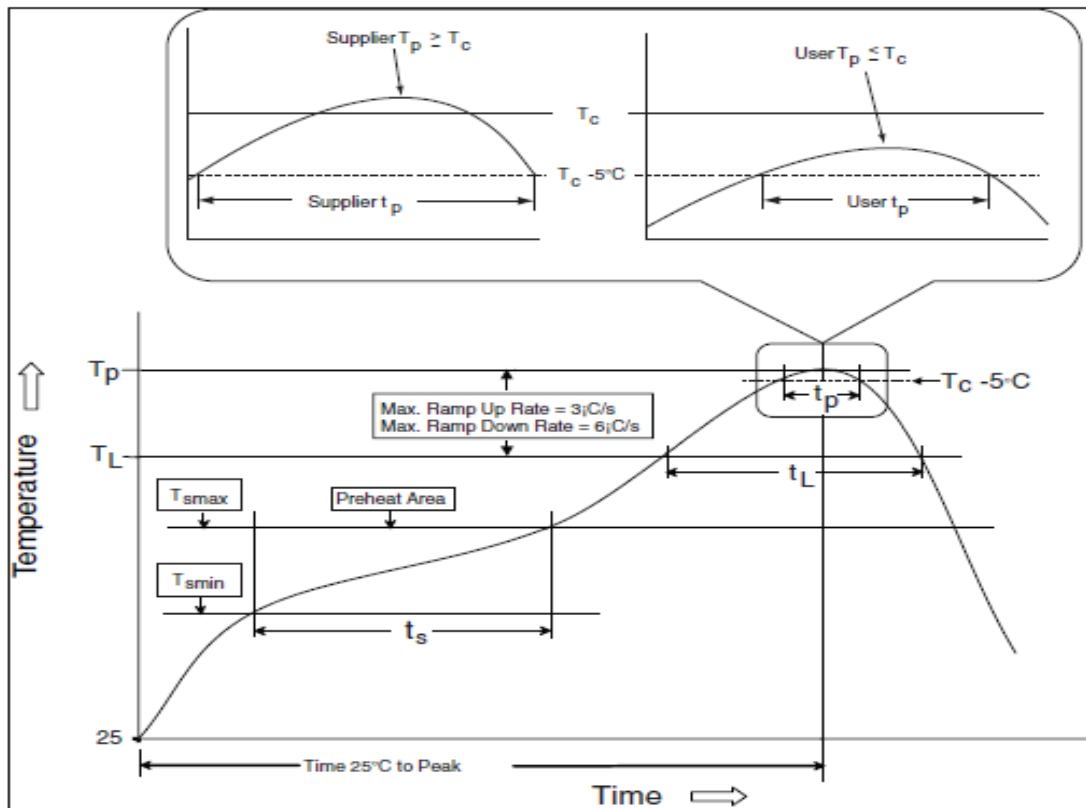

Figure 18 – IR/Convection Reflow Profile (IPC/JEDEC J-STD-020D.1)

Reflow is allowed 3 times. Caution must be taken to ensure time between re-flow runs does not exceed the allowed time by the moisture sensitivity label. If the time elapsed between the re-flows exceeds the moisture sensitivity time bake the board according to the moisture sensitivity label instructions.

Manual

Allowed up to 2 times with maximum temperature of 350°C no longer than 3 seconds.

RPC-1 Classification reflow profile

Profile Feature	Pb-Free Assembly
Preheat/Soak	
Temperature Min (T _{min})	150°C
Temperature Max (T _{max})	200°C
Time (ts) from (T _{min} to T _{max})	60-120 seconds
Ramp-up rate (TL to T _p)	3°C / second maximum
Liquidous temperature (TL)	217°C
Time (t _L) maintained above TL	60-150 seconds
Peak package body temperature (T _p)	For users T _p must not exceed the classification temp in Table RPC-2. For suppliers T _p must equal or exceed the Classification temp in Table RPC-2.
Time (t _p)* within 5°C of the specified classification temperature (T _c)	30* seconds
Ramp-down rate (T _p to TL)	6°C / second maximum
Time 25°C to peak temperature	8 minutes maximum
* Tolerance for peak profile temperature (T _p) is defined as a supplier minimum and a user maximum.	

Table 10 – RPC-1 Classification reflow profile

All temperatures refer to the center of the package, measured on the package body surface that is facing up during assembly reflow (e.g., live-bug). If parts are reflowed in other than the normal live-bug assembly reflow orientation (i.e., dead-bug), T_p shall be within $\pm 2^\circ\text{C}$ of the live-bug T_p and still meet the T_c requirements, otherwise, the profile shall be adjusted to achieve the latter. To accurately measure actual peak package body temperatures, refer to JEP140 for recommended thermocouple use.

Reflow profiles in this document are for classification/preconditioning and are not meant to specify board assembly profiles. Actual board assembly profiles should be developed based on specific process needs and board designs and should not exceed the parameters in Table RPC-1.

For example, if T_c is 260°C and time t_p is 30 seconds, this means the following for the supplier and the user.

For a supplier: The peak temperature must be at least 260°C. The time above 255°C must be at least 30 seconds.

For a user: The peak temperature must not exceed 260°C. The time above 255°C must not exceed 30 seconds.

All components in the test load shall meet the classification profile requirements.

ES9039MPRO & ES9039PRO Datasheet

RPC-2 Pb-Free Process – Classification Temperatures (Tc)

Package Thickness	Volume mm ³ , <350	Volume mm ³ , 350 to 2000	Volume mm ³ , >2000
<1.6 mm	260°C	260°C	260°C
1.6 mm – 2.5 mm	260°C	250°C	245°C
>2.5 mm	250°C	245°C	245°C

Table 11 – RPC-2 Pb free classification temperatures

At the discretion of the device manufacturer, but not the board assembler/user, the maximum peak package body temperature (T_p) can exceed the values specified in Table RPC-2. The use of a higher T_p does not change the classification temperature (T_c).

Package volume excludes external terminals (e.g., balls, bumps, lands, leads) and/or nonintegral heat sinks.

The maximum component temperature reached during reflow depends on package thickness and volume. The use of convection reflow processes reduces the thermal gradients between packages. However, thermal gradients due to differences in thermal mass of SMD packages may still exist.
