 The value is not quite reliable when traffic is ongoing on bus and at LP mode too.

- Bit 15 **RXWNE**: RxFIFO word not empty
  - 0: less than four bytes of RxFIFO space is occupied by data
  - 1: at least four bytes of RxFIFO space is occupied by data

*Note: This bit value does not depend on DSIZE setting and keeps together with RXPLVL[1:0] information about RxFIFO occupancy by residual data.*

Bits 14:13 **RXPLVL[1:0]**: RxFIFO packing level

When RXWNE=0 and data size is set up to 16-bit, the value gives number of remaining data frames persisting at RxFIFO.

00: no next frame is available at RxFIFO

01: 1 frame is available

10: 2 frames are available\*

11: 3 frames are available\*

(\*) optional count when the data size is set up to 8-bit.

When the frame size is greater than 16-bit, these bits read as 00. In consequence, the single data frame received at the FIFO cannot be detected neither by RWNE nor by RXPLVL bits if data size is set from 17 to 24 bits. The user then must apply other methods like TSIZE>0 or FTHLV=0.

Bit 12 **TXC**: TxFIFO transmission complete

The flag behavior depends on TSIZE setting.

When TSIZE=0 the TXC is changed by hardware exclusively and it raises each time the TxFIFO becomes empty and there is no activity on the bus.

If TSIZE <>0 there is no specific reason to monitor TXC as it just copies the EOT flag value including its software clearing. The TXC generates an interrupt when EOTIE is set.

0: Current data transaction is still ongoing, data is available in TxFIFO or last frame transmission is on going.

1: Last TxFIFO frame transmission completed

Bit 11 **SUSP**: suspension status

In Master mode, SUSP is set by hardware when a CSUSP request is done, either as soon as the current frame is completed after CSUSP request is done or at master automatic suspend receive mode (MASRX bit is set at SPI\_CR1 register) on RxFIFO full condition.

SUSP generates an interrupt when EOTIE is set.

This bit has to be cleared prior SPI is disabled by write 1 to SUSPC bit at SPI\_IFCR

0: SPI not suspended (master mode active or other mode).

1: Master mode is suspended (current frame completed)

Bit 10 **TSERF**: additional number of SPI data to be transacted was reload

This bit is cleared by write 1 to TSERFC bit at SPI\_IFCR or by writing the TSER[15:0] (SPI\_CR2) register

0: no acceptance

1: additional number of data accepted, current transaction continues

Bit 9 **MODF**: mode fault

0: no mode fault

1: mode fault detected

This bit is cleared by write 1 to MODFC bit at SPI\_IFCR. When MODF is set, the SPE and IOLOCK bits at the SPI\_CR1 register are reset and their setting is blocked.

Bit 8 **TIFRE**: TI frame format error

0: no TI Frame Error

1: TI Frame Error detected

This bit is cleared by write 1 to TIFREC bit at SPI\_IFCR

Bit 7 **CRCE**: CRC error

0: no CRC error

1: CRC error detected

This bit is cleared by write 1 to CRCEC bit at SPI\_IFCR

- Bit 6 **OVR**: overrun  
0: no overrun  
1: overrun detected  
This bit is cleared by write 1 to OVRC bit at SPI\_IFCR
- Bit 5 **UDR**: underrun at slave transmission mode  
0: no underrun  
1: underrun detected  
This bit is cleared by write 1 to UDRC bit at SPI\_IFCR  
*Note: UDR flag applies to Slave mode only*
- Bit 4 **TXTF**: transmission transfer filled  
0: upload of TxFIFO is on-going or not started  
1: TxFIFO upload is finished  
TXTF is set by hardware as soon as all of the data packets in a transfer have been submitted for transmission by application software or DMA, that is when TSIZE number of data have been pushed into the TxFIFO.  
This bit is cleared by software write 1 to TXTFC bit at SPI\_IFCR  
TXTF flag triggers an interrupt if TXTFIE bit is set.  
TXTF setting clears the TXIE and DXPIE masks so to off-load application software from calculating when to disable TXP and DXP interrupts.
- Bit 3 **EOT**: end of transfer  
EOT is set by hardware as soon as a full transfer is complete, that is when TSIZE number of data have been transmitted and/or received on the SPI. EOT is cleared by software write 1 to EOTC bit at SPI\_IFCR.  
EOT flag triggers an interrupt if EOTIE bit is set.  
If DXP flag is used until TXTF flag is set and DXPIE is cleared, EOT can be used to download the last packets contained into Rx FIFO in one-shot.  
0: transfer is on-going or not started  
1: transfer complete  
In master, EOT event terminates the data transaction and handles SS output optionally. When CRC is applied, the EOT event is extended over the CRC frame transaction.
- Bit 2 **DXP**: duplex packet  
0: Tx FIFO is Full and/or Rx FIFO is Empty  
1: Both Tx FIFO has space for write and Rx FIFO contains for read a single packet at least  
The DXP flag is set whenever both TXP and RXP flags are set regardless the SPI mode.
- Bit 1 **TXP**: Tx-packet space available  
0: there is not enough space to locate next data packet at Tx FIFO  
1: Tx FIFO has enough free location to host 1 data packet  
TXP flag is changed by hardware. It monitors overall space currently available at Tx FIFO if SPI is enabled. It has to be checked once a complete data packet is stored at Tx FIFO.
- Bit 0 **RXP**: Rx-packet available  
0: Rx FIFO is empty or a not complete data packet is received  
1: Rx FIFO contains at least 1 data packet  
RXP flag is changed by hardware. It monitors number of overall data currently available at Rx FIFO if SPI is enabled. It has to be checked once a data packet is completely read out from Rx FIFO.

**55.11.7 SPI/I2S interrupt/status flags clear register (SPI\_IFCR)**

Address offset: 0x18

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	SUSP C	TSERF C	MODF C	TIFRE C	CRCE C	OVR C	UDR C	TXTF C	EOT C	Res.	Res.	Res.
				w	w	w	w	w	w	w	w	w			

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **SUSPC**: SUSPend flag clear

Writing a 1 into this bit clears SUSP flag in the SPI\_SR register

Bit 10 **TSERFC**: TSERFC flag clear

Writing a 1 into this bit clears TSERF flag in the SPI\_SR register

Note: *TSERF is also reset by writing the TSERF[15:0] (SPI\_CR2) register*

Bit 9 **MODFC**: mode fault flag clear

Writing a 1 into this bit clears MODF flag in the SPI\_SR register

Bit 8 **TIFREC**: TI frame format error flag clear

Writing a 1 into this bit clears TIFRE flag in the SPI\_SR register

Bit 7 **CRCEC**: CRC error flag clear

Writing a 1 into this bit clears CRCE flag in the SPI\_SR register

Bit 6 **OVR**C: overrun flag clear

Writing a 1 into this bit clears OVR flag in the SPI\_SR register

Bit 5 **UDRC**: underrun flag clear

Writing a 1 into this bit clears UDR flag in the SPI\_SR register

Bit 4 **TXTFC**: transmission Transfer Filled flag clear

Writing a 1 into this bit clears TXTF flag in the SPI\_SR register

Bit 3 **EOTC**: end of transfer flag clear

Writing a 1 into this bit clears EOT flag in the SPI\_SR register

Bits 2:0 Reserved, must be kept at reset value.

### 55.11.8 SPI/I2S transmit data register (SPI\_TXDR)

Address offset: 0x20

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXDR[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TXDR[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **TXDR[31:0]**: transmit data register

The register serves as an interface with TxFIFO. A write to it accesses TxFIFO.

*Note: data is always right-aligned. Unused bits are ignored when writing to the register, and read as zero when the register is read.*

*Note: DR can be accessed byte-wise (8-bit access): in this case only one data-byte is written by single access.*

*halfword-wise (16 bit access) in this case 2 data-bytes or 1 halfword-data can be written by single access.*

*word-wise (32 bit access). In this case 4 data-bytes or 2 halfword-data or word-data can be written by single access.*

*Write access of this register less than the configured data size is forbidden.*

### 55.11.9 SPI/I2S receive data register (SPI\_RXDR)

Address offset: 0x30

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXDR[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RXDR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXDR[31:0]**: receive data register

The register serves as an interface with RxFIFO. When it is read, RxFIFO is accessed.

*Note: Data is always right-aligned. Unused bits are read as zero when the register is read. Writing to the register is ignored.*

*Note: DR can be accessed byte-wise (8-bit access): in this case only one data-byte is read by single access.*

*halfword-wise (16 bit access) in this case 2 data-bytes or 1 halfword-data can be read by single access*

*word-wise (32 bit access). In this case 4 data-bytes or 2 halfword-data or word-data can be read by single access.*

*Read access of this register less than the configured data size is forbidden.*

### 55.11.10 SPI polynomial register (SPI\_CRCPOLY)

Address offset: 0x40

Reset value: 0x0000 0107

The content of this register is write protected when SPI is enabled.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CRCPOLY[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CRCPOLY[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CRCPOLY[31:0]**: CRC polynomial register

This register contains the polynomial for the CRC calculation.

The default 9-bit polynomial setting 0x107 corresponds to default 8-bit setting of DSIZE. It is compatible with setting 0x07 used at some other ST products with fixed length of the polynomial string where the most significant bit of the string is always kept hidden.

Length of the polynomial is given by the most significant bit of the value stored at this register. It has to be set greater than DSIZE. CRC33\_17 bit has to be set additionally with CRCPOLY register when DSIZE is configured to maximum 32-bit or 16-bit size and CRC is enabled (to keep polynomial length greater than data size).

Bits 31-16 are reserved at the peripheral instances with data size limited to 16-bit. There is no constrain when 32-bit access is applied at these addresses. Reserved bits 31-16 are always read zero while any write to them is ignored.

### 55.11.11 SPI transmitter CRC register (SPI\_TXCRC)

Address offset: 0x44

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXCRC[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TXCRC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXCRC[31:0]**: CRC register for transmitter

When CRC calculation is enabled, the TXCRC[31:0] bits contain the computed CRC value of the subsequently transmitted bytes. CRC calculation is initialized when the CRCEN bit of SPI\_CR1 is written to 1 or when a data block is transacted completely. The CRC is calculated serially using the polynomial programmed in the SPI\_CRCPOLY register. The number of bits considered at calculation depends on SPI\_CRCPOLY register and CRCSIZE bits settings at SPI\_CFG1 register.

*Note: A read to this register when the communication is ongoing could return an incorrect value.*

*Not used for the I<sup>2</sup>S mode.*

*Bits 31-16 are reserved at the peripheral instances with data size limited to 16-bit.*

*There is no constrain when 32-bit access is applied at these addresses. Reserved bits 31-16 are always read zero while any write to them is ignored.*

*Note: The configuration of CRCSIZE bit field is not taken into account when the content of this register is read by software. No masking is applied for unused bits at this case.*

**55.11.12 SPI receiver CRC register (SPI\_RXCRC)**

Address offset: 0x48

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXCRC[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RXCRC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXCRC[31:0]**: CRC register for receiver

When CRC calculation is enabled, the RXCRC[31:0] bits contain the computed CRC value of the subsequently received bytes. CRC calculation is initialized when the CRCEN bit of SPI\_CR1 is written to 1 or when a data block is transacted completely. The CRC is calculated serially using the polynomial programmed in the SPI\_CRCPOLY register. The number of bits considered at calculation depends on SPI\_CRCPOLY register and CRCSIZE bits settings at SPI\_CFG1 register.

*Note: A read to this register when the communication is ongoing could return an incorrect value.*

*Not used for the I<sup>2</sup>S mode.*

*Bits 31-16 are reserved at the peripheral instances with data size limited to 16-bit.*

*There is no constrain when 32-bit access is applied at these addresses. Reserved bits 31-16 are always read zero while any write to them is ignored.*

*Note: The configuration of CRCSIZE bit field is not taken into account when the content of this register is read by software. No masking is applied for unused bits at this case.*

### 55.11.13 SPI underrun data register (SPI\_UDRDR)

Address offset: 0x4C

Reset value: 0x0000 0000

The content of this register is write protected when SPI is enabled.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
UDRDR[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
UDRDR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **UDRDR[31:0]**: data at slave underrun condition

The register is taken into account at slave mode and at underrun condition only. The number of bits considered depends on DSIZE bit settings at SPI\_CFG1 register. Underrun condition handling depends on setting if UDRDET and UDRCFG bits at SPI\_CFG1 register. Bits 31-16 are reserved at the peripheral instances with data size limited to 16-bit. There is no constrain when 32-bit access is applied at these addresses. Reserved bits 31-16 are always read zero while any write to them is ignored.

### 55.11.14 SPI/I2S configuration register (SPI\_I2SCFGR)

Address offset: 0x50

Reset value: 0x0000 0000

*Note:* All documented bits in this register must be configured when the I2S is disabled (SPE = 0). These bits are not used in SPI mode except for I2SMOD which needs to be kept at 0 in SPI mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	MCK OE	ODD	I2SDIV[7:0]							
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	DAT FMT	WSINV	FIXCH	CKPOL	CHLEN	DATLEN[1:0]		PCM SYNC	Res.	I2SSTD[1:0]		I2SCFG[2:0]			I2S MOD
	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **MCKOE**: master clock output enable

- 0: Master clock output is disabled
- 1: Master clock output is enabled

Bit 24 **ODD**: odd factor for the prescaler

- 0: Real divider value is = I2SDIV \* 2
- 1: Real divider value is = (I2SDIV \* 2) + 1

Refer to [Section 55.9.9: Clock generator](#) for details

Bits 23:16 **I2SDIV[7:0]**: I<sup>2</sup>S linear prescaler

I2SDIV can take any values except the value 1, when ODD is also equal to 1.  
Refer to [Section 55.9.9: Clock generator](#) for details

Bit 15 Reserved, must be kept at reset value.

Bit 14 **DATFMT**: data format

0: the data inside the SPI\_RXDR or SPI\_TXDR are right aligned  
1: the data inside the SPI\_RXDR or SPI\_TXDR are left aligned.

Bit 13 **WSINV**: Word select inversion

This bit is used to invert the default polarity of WS signal.

0: in I2S Philips standard, Left channel is transferred when WS is low, and right channel when WS is high.

In MSB or LSB justified mode, Left channel is transferred when WS is high, and right channel when WS is low.

In PCM mode the start of frame is indicated by a rising edge.

1: in I2S Philips standard, Left channel is transferred when WS is high, and right channel when WS is low.

In MSB or LSB justified mode, Left channel is transferred when WS is low, and right channel when WS is high.

In PCM mode the start of frame is indicated by a falling edge.

Bit 12 **FIXCH**: fixed channel length in slave

0: the channel length in slave mode is different from 16 or 32 bits (CHLEN not taken into account)  
1: the channel length in slave mode is supposed to be 16 or 32 bits (according to CHLEN)

Bit 11 **CKPOL**: serial audio clock polarity

0: the signals generated by the SPI/I2S (i.e. SDO and WS) are changed on the falling edge of CK and the signals received by the SPI/I2S (i.e. SDI and WS) are read of the rising edge of CK.

1: the signals generated by the SPI/I2S (i.e. SDO and WS) are changed on the rising edge of CK and the signals received by the SPI/I2S (i.e. SDI and WS) are read of the falling edge of CK.

Bit 10 **CHLEN**: channel length (number of bits per audio channel)

0: 16-bit wide

1: 32-bit wide

The bit write operation has a meaning only if DATLEN = 00 otherwise the channel length is fixed to 32-bit by hardware whatever the value filled in.

Bits 9:8 **DATLEN[1:0]**: data length to be transferred

00: 16-bit data length

01: 24-bit data length

10: 32-bit data length

11: not allowed

Bit 7 **PCMSYNC**: PCM frame synchronization

0: short frame synchronization

1: long frame synchronization

Bit 6 Reserved, must be kept at reset value.

- Bits 5:4 **I2SSTD[1:0]**: I<sup>2</sup>S standard selection
- 00: I<sup>2</sup>S Philips standard.
  - 01: MSB justified standard (left justified)
  - 10: LSB justified standard (right justified)
  - 11: PCM standard

For more details on I<sup>2</sup>S standards, refer to [Section 55.9.5: Supported audio protocols](#)

- Bits 3:1 **I2SCFG[2:0]**: I2S configuration mode
- 000: slave - transmit
  - 001: slave - receive
  - 010: master - transmit
  - 011: master - receive
  - 100: slave - full duplex
  - 101: master - full duplex
  - others, not used

- Bit 0 **I2SMOD**: I2S mode selection
- 0: SPI mode is selected
  - 1: I2S/PCM mode is selected

### 55.12 SPI register map and reset values

Table 409. SPI register map and reset values

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

- Bits 31-16 are reserved at the peripheral instances with data size limited to 16-bit. There is no constrain when 32-bit access is applied at these addresses. Reserved bits 31-16 are always read zero while any write to them is ignored. Refer to Table register boundary addresses.

Refer to [Section 2.3 on page 129](#) for the register boundary addresses.

## 56 Serial audio interface (SAI)

### 56.1 Introduction

The SAI interface (serial audio interface) offers a wide set of audio protocols due to its flexibility and wide range of configurations. Many stereo or mono audio applications may be targeted. I2S standards, LSB or MSB-justified, PCM/DSP, TDM, and AC'97 protocols may be addressed for example. SPDIF output is offered when the audio block is configured as a transmitter.

To bring this level of flexibility and reconfigurability, the SAI contains two independent audio subblocks. Each block has its own clock generator and I/O line controller.

The SAI works in master or slave configuration. The audio subblocks are either receiver or transmitter and work synchronously or not (with respect to the other one).

The SAI can be connected with other SAIs to work synchronously.

### 56.2 SAI main features

- Two independent audio subblocks which can be transmitters or receivers with their respective FIFO.
- 8-word integrated FIFOs for each audio subblock.
- Synchronous or asynchronous mode between the audio subblocks.
- Possible synchronization between multiple SAIs.
- Master or slave configuration independent for both audio subblocks.
- Clock generator for each audio block to target independent audio frequency sampling when both audio subblocks are configured in master mode.
- Data size configurable: 8-, 10-, 16-, 20-, 24-, 32-bit.
- Audio protocol: I2S, LSB or MSB-justified, PCM/DSP, TDM, AC'97
- PDM interface, supporting up to 4 microphone pairs
- SPDIF output available if required.
- Up to 16 slots available with configurable size.
- Number of bits by frame can be configurable.
- Frame synchronization active level configurable (offset, bit length, level).
- First active bit position in the slot is configurable.
- LSB first or MSB first for data transfer.
- Mute mode.
- Stereo/Mono audio frame capability.
- Communication clock strobing edge configurable (SCK).
- Error flags with associated interrupts if enabled respectively.
  - Overrun and underrun detection,
  - Anticipated frame synchronization signal detection in slave mode,
  - Late frame synchronization signal detection in slave mode,
  - Codec not ready for the AC'97 mode in reception.

- Interrupt sources when enabled:
  - Errors,
  - FIFO requests.
- 2-channel DMA interface.

## 56.3 SAI implementation

**Table 410. STM32H7A3/7B3 and STM32H7B0 SAI features <sup>(1)</sup>**

SAI features	SAI1	SAI2
I2S, LSB or MSB-justified, PCM/DSP, TDM, AC'97	X	X
FIFO size	8 words	8 words
SPDIF	X	X
PDM	X <sup>(2)</sup>	-

1. 'X' = supported, '-' = not supported.

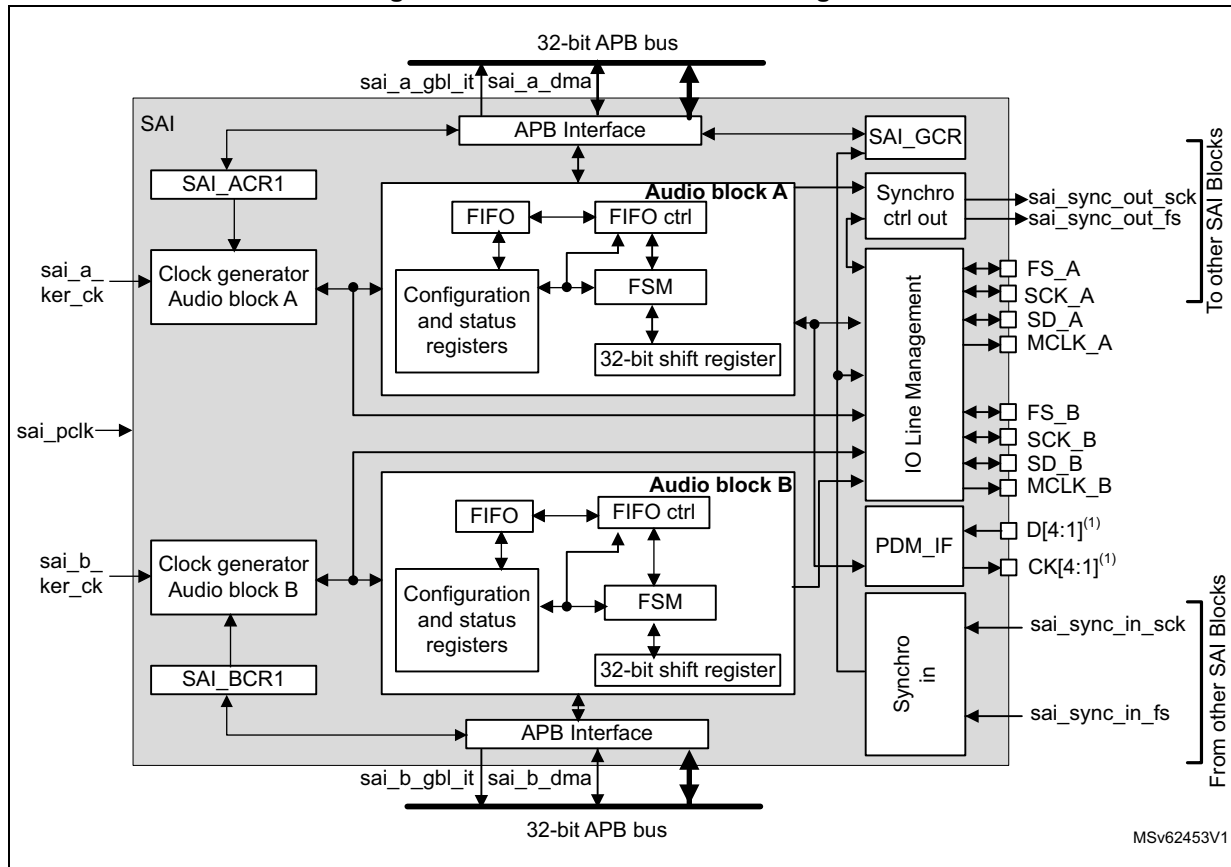

2. Only signals D[3:1], and CK[2:1] are available.

## 56.4 SAI functional description

### 56.4.1 SAI block diagram

[Figure 616](#) shows the SAI block diagram while [Table 411](#) and [Table 412](#) list SAI internal and external signals.

Figure 616. SAI functional block diagram

1. These signals might not be available for all SAI instances. Refer to [Section 56.3: SAI implementation](#) for details.

The SAI is mainly composed of two audio subblocks with their own clock generator. Each audio block integrates a 32-bit shift register controlled by their own functional state machine. Data are stored or read from the dedicated FIFO. FIFO may be accessed by the CPU, or by DMA in order to leave the CPU free during the communication. Each audio block is independent. They can be synchronous with each other.

An I/O line controller manages a set of 4 dedicated pins (SD, SCK, FS, MCLK) for a given audio block in the SAI. Some of these pins can be shared if the two subblocks are declared as synchronous to leave some free to be used as general purpose I/Os. The MCLK pin can be output, or not, depending on the application, the decoder requirement and whether the audio block is configured as the master.

If one SAI is configured to operate synchronously with another one, even more I/Os can be freed (except for pins SD\_x).

The functional state machine can be configured to address a wide range of audio protocols. Some registers are present to set-up the desired protocols (audio frame waveform generator).

The audio subblock can be a transmitter or receiver, in master or slave mode. The master mode means the SCK\_x bit clock and the frame synchronization signal are generated from the SAI, whereas in slave mode, they come from another external or internal master. There is a particular case for which the FS signal direction is not directly linked to the master or slave mode definition. In AC'97 protocol, it is an SAI output even if the SAI (link controller) is set-up to consume the SCK clock (and so to be in Slave mode).

Note: For ease of reading of this section, the notation SAI\_x refers to SAI\_A or SAI\_B, where 'x' represents the SAI A or B subblock.

### 56.4.2 SAI pins and internal signals

**Table 411. SAI internal input/output signals**

Internal signal name	Signal type	Description
sai_a_gbl_it/ sai_b_gbl_it	Output	Audio block A and B global interrupts.
sai_a_dma, sai_b_dma	Input/output	Audio block A and B DMA acknowledges and requests.
sai_sync_out_sck, sai_sync_out_fs	Output	Internal clock and frame synchronization output signals exchanged with other SAI blocks.
sai_sync_in_sck, sai_sync_in_fs	Input	Internal clock and frame synchronization input signals exchanged with other SAI blocks.
sai_a_ker_ck/ sai_b_ker_ck	Input	Audio block A/B kernel clock.
sai_pclk	Input	APB clock.

**Table 412. SAI input/output pins**

Name	Signal type	Comments
SAI_SCK_A/B	Input/output	Audio block A/B bit clock.
SAI_MCLK_A/B	Output	Audio block A/B master clock.
SAI_SD_A/B	Input/output	Data line for block A/B.
SAI_FS_A/B	Input/output	Frame synchronization line for audio block A/B.
SAI_CK[4:1]	Output	PDM bitstream clock <sup>(1)</sup> .
SAI_D[4:1]	Input	PDM bitstream data <sup>(1)</sup> .

1. These signals might not be available in all SAI instances. Refer to [Section 56.3: SAI implementation](#) for details.

### 56.4.3 Main SAI modes

Each audio subblock of the SAI can be configured to be master or slave via MODE bits in the SAI\_xCR1 register of the selected audio block.

#### Master mode

In master mode, the SAI delivers the timing signals to the external connected device:

- The bit clock and the frame synchronization are output on pin SCK\_x and FS\_x, respectively.
- If needed, the SAI can also generate a master clock on MCLK\_x pin.

Both SCK\_x, FS\_x and MCLK\_x are configured as outputs.

### Slave mode

The SAI expects to receive timing signals from an external device.

- If the SAI subblock is configured in asynchronous mode, then SCK\_x and FS\_x pins are configured as inputs.
- If the SAI subblock is configured to operate synchronously with another SAI interface or with the second audio subblock, the corresponding SCK\_x and FS\_x pins are left free to be used as general purpose I/Os.

In slave mode, MCLK\_x pin is not used and can be assigned to another function.

It is recommended to enable the slave device before enabling the master.

### Configuring and enabling SAI modes

Each audio subblock can be independently defined as a transmitter or receiver through the MODE bit in the SAI\_xCR1 register of the corresponding audio block. As a result, SAI\_SD\_x pin is respectively configured as an output or an input.

Two master audio blocks in the same SAI can be configured with two different MCLK and SCK clock frequencies. In this case they have to be configured in asynchronous mode.

Each of the audio blocks in the SAI are enabled by SAIEN bit in the SAI\_xCR1 register. As soon as this bit is active, the transmitter or the receiver is sensitive to the activity on the clock line, data line and synchronization line in slave mode.

In master TX mode, enabling the audio block immediately generates the bit clock for the external slaves even if there is no data in the FIFO. However FS signal generation is conditioned by the presence of data in the FIFO. After the FIFO receives the first data to transmit, this data is output to external slaves. If there is no data to transmit in the FIFO, 0 values are then sent in the audio frame with an underrun flag generation.

In slave mode, the audio frame starts when the audio block is enabled and when a start of frame is detected.

In Slave TX mode, no underrun event is possible on the first frame after the audio block is enabled, because the mandatory operating sequence in this case is:

1. Write into the SAI\_xDR (by software or by DMA).
2. Wait until the FIFO threshold (FLH) flag is different from 0b000 (FIFO empty).
3. Enable the audio block in slave transmitter mode.

## 56.4.4 SAI synchronization mode

There are two levels of synchronization, either at audio subblock level or at SAI level.

### Internal synchronization

An audio subblock can be configured to operate synchronously with the second audio subblock in the same SAI. In this case, the bit clock and the frame synchronization signals are shared to reduce the number of external pins used for the communication. The audio block configured in synchronous mode sees its own SCK\_x, FS\_x, and MCLK\_x pins released back as GPIOs while the audio block configured in asynchronous mode is the one for which FS\_x and SCK\_x and MCLK\_x I/O pins are relevant (if the audio block is considered as master).

Typically, the audio block in synchronous mode can be used to configure the SAI in full duplex mode. One of the two audio blocks can be configured as a master and the other as slave, or both as slaves with one asynchronous block (corresponding SYNCEN[1:0] bits set to 00 in SAI\_xCR1) and one synchronous block (corresponding SYNCEN[1:0] bits set to 01 in the SAI\_xCR1).

*Note:* Due to internal resynchronization stages, PCLK APB frequency must be higher than twice the bit rate clock frequency.

**External synchronization**

The audio subblocks can also be configured to operate synchronously with another SAI. This can be done as follow:

1. The SAI, which is configured as the source from which the other SAI is synchronized, has to define which of its audio subblock is supposed to provide the FS and SCK signals to other SAI. This is done by programming SYNCOUT[1:0] bits.
2. The SAI which receives the synchronization signals, has to select which SAI provides the synchronization by setting the proper value on SYNCIN[1:0] bits. For each of the two SAI audio subblocks, the user must then specify if it operates synchronously with the other SAI via the SYNCEN bit.

*Note:* SYNCIN[1:0] and SYNCOUT[1:0] bits are located into the SAI\_GCR register, and SYNCEN bits into SAI\_xCR1 register.

If both audio subblocks in a given SAI need to be synchronized with another SAI, it is possible to choose one of the following configurations:

- Configure each audio block to be synchronous with another SAI block through the SYNCEN[1:0] bits.
- Configure one audio block to be synchronous with another SAI through the SYNCEN[1:0] bits. The other audio block is then configured as synchronous with the second SAI audio block through SYNCEN[1:0] bits.

The following table shows how to select the proper synchronization signal depending on the SAI block used. For example SAI2 can select the synchronization from SAI1 by setting SAI2 SYNCIN to 0. If SAI1 wants to select the synchronization coming from SAI2, SAI1 SYNCIN must be set to 1. Positions noted as 'Reserved' must not be used.

**Table 413. External synchronization selection**

Block instance	SYNCIN = 1	SYNCIN = 0
SAI1	SAI2 sync.	Reserved
SAI2	Reserved	SAI1 sync.

**56.4.5 Audio data size**

The audio frame can target different data sizes by configuring bit DS[2:0] in the SAI\_xCR1 register. The data sizes may be 8, 10, 16, 20, 24 or 32 bits. During the transfer, either the MSB or the LSB of the data are sent first, depending on the configuration of bit LSBFIRST in the SAI\_xCR1 register.

### 56.4.6 Frame synchronization

The FS signal acts as the Frame synchronization signal in the audio frame (start of frame). The shape of this signal is completely configurable in order to target the different audio protocols with their own specificities concerning this Frame synchronization behavior. This reconfigurability is done using register SAI\_xFRCR. [Figure 617](#) illustrates this flexibility.

**Figure 617. Audio frame**

In AC'97 mode or in SPDIF mode (bit PRTCFCG[1:0] = 10 or PRTCFCG[1:0] = 01 in the SAI\_xCR1 register), the frame synchronization shape is forced to match the AC'97 protocol. The SAI\_xFRCR register value is ignored.

Each audio block is independent and consequently each one requires a specific configuration.

#### Frame length

- Master mode

The audio frame length can be configured to up to 256 bit clock cycles, by setting FRL[7:0] field in the SAI\_xFRCR register.

If the frame length is greater than the number of declared slots for the frame, the remaining bits to transmit is extended to 0 or the SD line is released to HI-z depending the state of bit TRIS in the SAI\_xCR2 register (refer to [FS signal role](#)). In reception mode, the remaining bit is ignored.

If bit NODIV is cleared, (FRL+1) must be equal to a power of 2, from 8 to 256, to ensure that an audio frame contains an integer number of MCLK pulses per bit clock cycle.

If bit NODIV is set, the (FRL+1) field can take any value from 8 to 256. Refer to [Section 56.4.8: SAI clock generator](#).

- Slave mode

The audio frame length is mainly used to specify to the slave the number of bit clock cycles per audio frame sent by the external master. It is used mainly to detect from the master any anticipated or late occurrence of the Frame synchronization signal during an ongoing audio frame. In this case an error is generated. For more details refer to [Section 56.4.14: Error flags](#).

In slave mode, there are no constraints on the FRL[7:0] configuration in the SAI\_xFRCR register.

The number of bits in the frame is equal to FRL[7:0] + 1.

The minimum number of bits to transfer in an audio frame is 8.

### Frame synchronization polarity

FSPOL bit in the SAI\_xFRCR register sets the active polarity of the FS pin from which a frame is started. The start of frame is edge sensitive.

In slave mode, the audio block waits for a valid frame to start transmitting or receiving. Start of frame is synchronized to this signal. It is effective only if the start of frame is not detected during an ongoing communication and assimilated to an anticipated start of frame (refer to [Section 56.4.14: Error flags](#)).

In master mode, the frame synchronization is sent continuously each time an audio frame is complete until the SAIEN bit in the SAI\_xCR1 register is cleared. If no data are present in the FIFO at the end of the previous audio frame, an underrun condition is managed as described in [Section 56.4.14: Error flags](#), but the audio communication flow is not interrupted.

### Frame synchronization active level length

The FSALL[6:0] bits of the SAI\_xFRCR register enable the configuration of the length of the active level of the Frame synchronization signal. The length can be set from 1 to 128 bit clock cycles.

As an example, the active length can be half of the frame length in I2S, LSB or MSB-justified modes, or one-bit wide for PCM/DSP or TDM.

### Frame synchronization offset

Depending on the audio protocol targeted in the application, the Frame synchronization signal can be asserted when transmitting the last bit or the first bit of the audio frame (this is the case in I2S standard protocol and in MSB-justified protocol, respectively). FSOFF bit in the SAI\_xFRCR register enables to choose one of the two configurations.

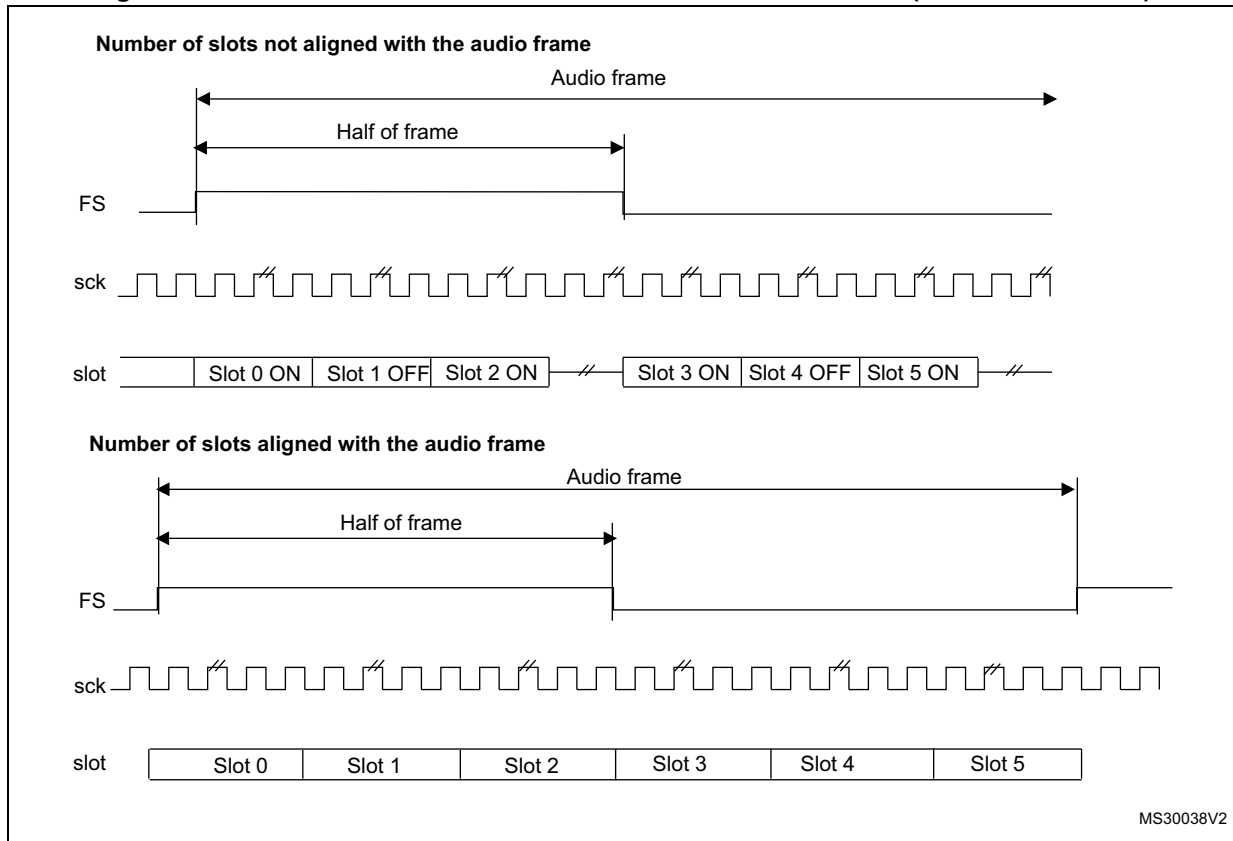

### FS signal role

The FS signal can have a different meaning depending on the FS function. FSDEF bit in the SAI\_xFRCR register selects which meaning it has:

- 0: start of frame, like for instance the PCM/DSP, TDM, AC'97, audio protocols,
- 1: start of frame and channel side identification within the audio frame like for the I2S, the MSB or LSB-justified protocols.

When the FS signal is considered as a start of frame and channel side identification within the frame, the number of declared slots must be considered to be half the number for the left channel and half the number for the right channel. If the number of bit clock cycles on half audio frame is greater than the number of slots dedicated to a channel side, and TRIS = 0, 0 is sent for transmission for the remaining bit clock cycles in the SAI\_xCR2 register. Otherwise if TRIS = 1, the SD line is released to HI-Z. In reception mode, the remaining bit clock cycles are not considered until the channel side changes.

Figure 618. FS role is start of frame + channel side identification (FSDEF = TRIS = 1)

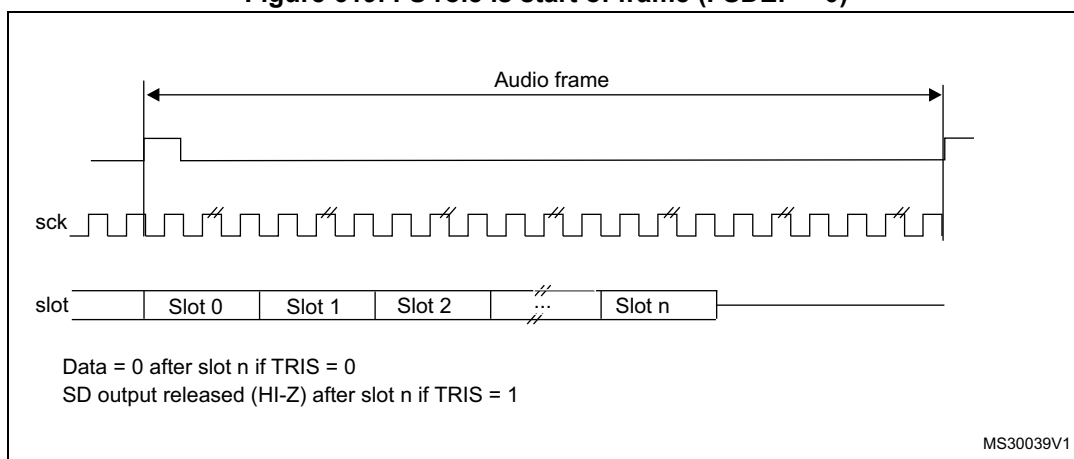

1. The frame length should be even.

If FSDEF bit in SAI\_xFRCR is kept clear, so FS signal is equivalent to a start of frame, and if the number of slots defined in NBSLOT[3:0] in SAI\_xSLOTR multiplied by the number of bits by slot configured in SLOTSZ[1:0] in SAI\_xSLOTR is less than the frame size (bit FRL[7:0] in the SAI\_xFRCR register), then:

- if TRIS = 0 in the SAI\_xCR2 register, the remaining bit after the last slot is forced to 0 until the end of frame in case of transmitter,
- if TRIS = 1, the line is released to HI-Z during the transfer of these remaining bits. In reception mode, these bits are discarded.

Figure 619. FS role is start of frame (FSDEF = 0)

The FS signal is not used when the audio block in transmitter mode is configured to get the SPDIF output on the SD line. The corresponding FS I/O is released and left free for other purposes.

### 56.4.7 Slot configuration

The slot is the basic element in the audio frame. The number of slots in the audio frame is equal to  $NBSLOT[3:0] + 1$ .

The maximum number of slots per audio frame is fixed at 16.

For AC'97 protocol or SPDIF (when bit  $PRTCFCFG[1:0] = 10$  or  $PRTCFCFG[1:0] = 01$ ), the number of slots is automatically set to target the protocol specification, and the value of  $NBSLOT[3:0]$  is ignored.

Each slot can be defined as a valid slot, or not, by setting  $SLOTEN[15:0]$  bits of the  $SAI\_xSLOTR$  register.

When an invalid slot is transferred, the SD data line is either forced to 0 or released to HI-z depending on TRIS bit configuration (refer to [Output data line management on an inactive slot](#)) in transmitter mode. In receiver mode, the received value from the end of this slot is ignored. Consequently, there is no FIFO access and so no request to read or write the FIFO linked to this inactive slot status.

The slot size is also configurable as shown in [Figure 620](#). The size of the slots is selected by setting  $SLOTSZ[1:0]$  bits in the  $SAI\_xSLOTR$  register. The size is applied identically for each slot in an audio frame.

**Figure 620. Slot size configuration with FBOFF = 0 in SAI\_xSLOTR**

It is possible to choose the position of the first data bit to transfer within the slots. This offset is configured by FBOFF[4:0] bits in the SAI\_xSLOTR register. 0 values are injected in transmitter mode from the beginning of the slot until this offset position is reached. In reception, the bit in the offset phase is ignored. This feature targets the LSB justified protocol (if the offset is equal to the slot size minus the data size).

**Figure 621. First bit offset**

It is mandatory to respect the following conditions to avoid bad SAI behavior:

- $FBOFF \leq (SLOTSZ - DS)$ ,
- $DS \leq SLOTSZ$ ,
- $NBSLOT \times SLOTSZ \leq FRL$  (frame length),

The number of slots must be even when bit FSDEF in the SAI\_xFRCR register is set.

In AC'97 and SPDIF protocol (bit PRTCFG[1:0] = 10 or PRTCFG[1:0] = 01), the slot size is automatically set as defined in [Section 56.4.11: AC'97 link controller](#).

### 56.4.8 SAI clock generator

Each audio block has its own clock generator. The clock generator builds the master clock (MCLK\_x) and bit clock (SCK\_x) signals from the sai\_x\_ker\_ck. The sai\_x\_ker\_ck clock is delivered by the clock controller of the product (RCC).

#### Generation of the master clock (MCLK\_x)

The clock generator provides the master clock (MCLK\_x) when the audio block is defined as Master or Slave. The master clock is generated as soon as the MCKEN bit is set to 1 even if the SAIEN bit for the corresponding block is set to 0. This feature can be useful if the MCLK\_x clock is used as system clock for an external audio device, since it enables the generation of the MCLK\_x before activating the audio stream.

To generate a master clock on MCLK\_x output before transferring the audio samples, the user application has to follow the sequence below:

1. Check that SAIEN = 0.
2. Program the MCKDIV[5:0] divider to the required value.
3. Set the MCKEN bit to 1.
4. Later, the application can configure other parts of the SAI, and sets the SAIEN bit to 1 to start the transfer of audio samples.

To avoid disturbances on the clock generated on MCLK\_x output, the following operations are not recommended:

- Changing MCKDIV when MCKEN = 1
- Setting MCKEN to 0 if the SAIEN = 1

The SAI guarantees that there is no spurs on MCLK\_x output when the MCLK\_x is switched ON and OFF via MCKEN bit (with SAIEN = 0).

Table 414 shows MCLK\_x activation conditions.

**Table 414. MCLK\_x activation conditions**

MCKEN	NODIV	SAIEN for block x	MCLK_x
0	X	0	Disabled
1			Enabled
0	1	1	Disabled
1			Enabled
X	0		Enabled

*Note:* MCLK\_x can also be generated in AC'97 mode, when MCKEN is set to 1.

### Generation of the bit clock (SCK\_x)

The clock generator provides the bit clock (SCK\_x) when the audio block is defined as Master. The frame synchronization (FS\_x) is also derived from the signals provided by the clock generator.

In Slave mode, the value of NODIV and OSR fields are ignored, and the SCK\_x clock is not generated.

The bit clock strobing edge of SCK\_x can be configured through the CKSTR fields, which is functional both in master and slave mode.

Figure 622 illustrates the architecture of the audio block clock generator.

Figure 622. Audio block clock generator overview

The NODIV bit must be used to force the ratio between the master clock (MCLK\_x) and the frame synchronization (FS\_x) frequency to 256 or 512.

- If NODIV is set to 0, the frequency ratio between the frame synchronization and the master clock is fixed to 512 or 256, according to OSR value, but the frame length must be a power of 2. More details are given hereafter.
- If NODIV is set to 1, the application can adjust the frequency of the bit clock (SCK\_x) via MCKDIV. In addition there is no restriction on the frame length value as long as the frame length is bigger or equal to 8 (i.e.  $FRL[7:0] > 6$ ). The frame synchronization frequency depends on MCKDIV and frame length (FRL[7:0]). In that case, the frequency of the MCLK\_x is equal to the SCK\_x.

The NODIV, MCKEN, SAIEN, OVR, CKSTR and MCKDIV[5:0] bits belong to the SAI\_xCR1 register, while FRL[7:0] belongs to SAI\_xFRCR.

**Clock generator programming when NODIV = 0**

In that case, MCLK\_x frequency is:

- $F_{MCLK\_x} = 256 \times F_{FS\_x}$  if  $OSR = 0$
- $F_{MCLK\_x} = 512 \times F_{FS\_x}$  if  $OSR = 1$

When MCKDIV is different from 0, MCLK\_x frequency is given by the formula below:

$$F_{MCLK\_x} = \frac{F_{sai\_x\_ker\_ck}}{MCKDIV}$$

The frame synchronization frequency is given by:

$$F_{FS\_x} = \frac{F_{sai\_x\_ker\_ck}}{MCKDIV \times (OSR + 1) \times 256}$$

The bit clock frequency (SCK\_x) is given by the following formula:

$$F_{SCK\_x} = \frac{F_{sai\_x\_ker\_ck} \times (FRL + 1)}{MCKDIV \times (OSR + 1) \times 256}$$

*Note:*

*When NODIV is equal to 0, (FRL+1) must be a power of two. In addition (FRL+1) must range between 8 and 256. (FRL + 1) represents the number of bit clock in the audio frame.*

*When MCKDIV division ratio is odd, the MCLK duty cycle is not 50%. The bit clock signal (SCK\_x) can also have a duty cycle different from 50% if MCKDIV is odd, if OSR is equal to 0, and if (FRL+1) = 2<sup>8</sup>.*

*It is recommended, to program MCKDIV to an even value or to big values (higher than 10).*

*Note that MCKDIV = 0 gives the same result as MCKDIV = 1.*

**Clock generator programming when NODIV = 1**

When MCKDIV is different from 0, the frequency of the bit clock (SCK\_x) is given in the formula below:

$$F_{SCK\_x} = F_{MCLK\_x} = \frac{F_{sai\_x\_ker\_ck}}{MCKDIV}$$

The frequency of the frame synchronization (FS\_x) is given by the following formula:

$$F_{FS\_x} = \frac{F_{sai\_x\_ker\_ck}}{(FRL + 1) \times MCKDIV}$$

*Note:*

*When NODIV is set to 1, (FRL+1) can take any values from 8 to 256.*

*Note that MCKDIV = 0 gives the same result as MCKDIV = 1.*

### Clock generator programming examples

Table 415 gives programming examples for 48, 96 and 192 kHz.

**Table 415. Clock generator programming examples**

Input sai_x_ker_ck clock frequency	MCLK	F <sub>MCLK</sub> /F <sub>FS</sub>	FRL <sup>(1)</sup>	OSR	NODIV	MCKEN	MCKDIV[5:0]	Audio Sampling frequency (F <sub>FS</sub> )
98.304 MHz	Y	512	2 <sup>N-1</sup>	1	0	1	0 or 1	192 kHz
		512	2 <sup>N-1</sup>	1	0	1	2	96 kHz
		512	2 <sup>N-1</sup>	1	0	1	4	48 kHz
		256	2 <sup>N-1</sup>	0	0	1	2	192 kHz
		256	2 <sup>N-1</sup>	0	0	1	4	96 kHz
		256	2 <sup>N-1</sup>	0	0	1	8	48 kHz
	N	-	63	-	1	0	8	192 kHz
		-	63	-	1	0	16	96 kHz
		-	63	-	1	0	32	48 kHz

1. N is an integer value between 3 and 8.

#### 56.4.9 Internal FIFOs

Each audio block in the SAI has its own FIFO. Depending if the block is defined to be a transmitter or a receiver, the FIFO can be written or read, respectively. There is therefore only one FIFO request linked to FREQ bit in the SAI\_xSR register.

An interrupt is generated if FREQIE bit is enabled in the SAI\_xIM register. This depends on:

- FIFO threshold setting (FLVL bits in SAI\_xCR2)
- Communication direction (transmitter or receiver). Refer to [Interrupt generation in transmitter mode](#) and [Interrupt generation in reception mode](#).

#### Interrupt generation in transmitter mode

The interrupt generation depends on the FIFO configuration in transmitter mode:

- When the FIFO threshold bits in SAI\_xCR2 register are configured as FIFO empty (FTH[2:0] set to 0b000), an interrupt is generated (FREQ bit set by hardware to 1 in SAI\_xSR register) if no data are available in SAI\_xDR register (FLVL[2:0] bits in SAI\_xSR is less than 001b). This Interrupt (FREQ bit in SAI\_xSR register) is cleared by hardware when the FIFO is no more empty (FLVL[2:0] bits in SAI\_xSR are different from 0b000) i.e one or more data are stored in the FIFO.
- When the FIFO threshold bits in SAI\_xCR2 register are configured as FIFO quarter full (FTH[2:0] set to 001b), an interrupt is generated (FREQ bit set by hardware to 1 in SAI\_xSR register) if less than a quarter of the FIFO contains data (FLVL[2:0] bits in SAI\_xSR are less than 0b010). This Interrupt (FREQ bit in SAI\_xSR register) is cleared by hardware when at least a quarter of the FIFO contains data (FLVL[2:0] bits in SAI\_xSR are higher or equal to 0b010).
- When the FIFO threshold bits in SAI\_xCR2 register are configured as FIFO half full (FTH[2:0] set to 0b010), an interrupt is generated (FREQ bit set by hardware to 1 in

SAI\_xSR register) if less than half of the FIFO contains data (FLVL[2:0] bits in SAI\_xSR are less than 011b). This Interrupt (FREQ bit in SAI\_xSR register) is cleared by hardware when at least half of the FIFO contains data (FLVL[2:0] bits in SAI\_xSR are higher or equal to 011b).

- When the FIFO threshold bits in SAI\_xCR2 register are configured as FIFO three quarter (FTH[2:0] set to 011b), an interrupt is generated (FREQ bit is set by hardware to 1 in SAI\_xSR register) if less than three quarters of the FIFO contain data (FLVL[2:0] bits in SAI\_xSR are less than 0b100). This Interrupt (FREQ bit in SAI\_xSR register) is cleared by hardware when at least three quarters of the FIFO contain data (FLVL[2:0] bits in SAI\_xSR are higher or equal to 0b100).
- When the FIFO threshold bits in SAI\_xCR2 register are configured as FIFO full (FTH[2:0] set to 0b100), an interrupt is generated (FREQ bit is set by hardware to 1 in SAI\_xSR register) if the FIFO is not full (FLVL[2:0] bits in SAI\_xSR is less than 101b). This Interrupt (FREQ bit in SAI\_xSR register) is cleared by hardware when the FIFO is full (FLVL[2:0] bits in SAI\_xSR is equal to 101b value).

### Interrupt generation in reception mode

The interrupt generation depends on the FIFO configuration in reception mode:

- When the FIFO threshold bits in SAI\_xCR2 register are configured as FIFO empty (FTH[2:0] set to 0b000), an interrupt is generated (FREQ bit is set by hardware to 1 in SAI\_xSR register) if at least one data is available in SAI\_xDR register (FLVL[2:0] bits in SAI\_xSR is higher or equal to 001b). This Interrupt (FREQ bit in SAI\_xSR register) is cleared by hardware when the FIFO becomes empty (FLVL[2:0] bits in SAI\_xSR is equal to 0b000) i.e no data are stored in FIFO.
- When the FIFO threshold bits in SAI\_xCR2 register are configured as FIFO quarter fully (FTH[2:0] set to 001b), an interrupt is generated (FREQ bit is set by hardware to 1 in SAI\_xSR register) if at least one quarter of the FIFO data locations are available (FLVL[2:0] bits in SAI\_xSR is higher or equal to 0b010). This Interrupt (FREQ bit in SAI\_xSR register) is cleared by hardware when less than a quarter of the FIFO data locations become available (FLVL[2:0] bits in SAI\_xSR is less than 0b010).
- When the FIFO threshold bits in SAI\_xCR2 register are configured as FIFO half fully (FTH[2:0] set to 0b010 value), an interrupt is generated (FREQ bit is set by hardware to 1 in SAI\_xSR register) if at least half of the FIFO data locations are available (FLVL[2:0] bits in SAI\_xSR is higher or equal to 011b). This Interrupt (FREQ bit in SAI\_xSR register) is cleared by hardware when less than half of the FIFO data locations become available (FLVL[2:0] bits in SAI\_xSR is less than 011b).
- When the FIFO threshold bits in SAI\_xCR2 register are configured as FIFO three quarter full (FTH[2:0] set to 011b value), an interrupt is generated (FREQ bit is set by hardware to 1 in SAI\_xSR register) if at least three quarters of the FIFO data locations are available (FLVL[2:0] bits in SAI\_xSR is higher or equal to 0b100). This Interrupt (FREQ bit in SAI\_xSR register) is cleared by hardware when the FIFO has less than three quarters of the FIFO data locations available (FLVL[2:0] bits in SAI\_xSR is less than 0b100).
- When the FIFO threshold bits in SAI\_xCR2 register are configured as FIFO full (FTH[2:0] set to 0b100), an interrupt is generated (FREQ bit is set by hardware to 1 in SAI\_xSR register) if the FIFO is full (FLVL[2:0] bits in SAI\_xSR is equal to 101b). This Interrupt (FREQ bit in SAI\_xSR register) is cleared by hardware when the FIFO is not full (FLVL[2:0] bits in SAI\_xSR is less than 101b).

Like interrupt generation, the SAI can use the DMA if DMAEN bit in the SAI\_xCR1 register is set. The FREQ bit assertion mechanism is the same as the interrupt generation mechanism described above for FREQIE.

Each FIFO is an 8-word FIFO. Each read or write operation from/to the FIFO targets one word FIFO location whatever the access size. Each FIFO word contains one audio slot. FIFO pointers are incremented by one word after each access to the SAI\_xDR register.

Data should be right aligned when it is written in the SAI\_xDR.

Data received are right aligned in the SAI\_xDR.

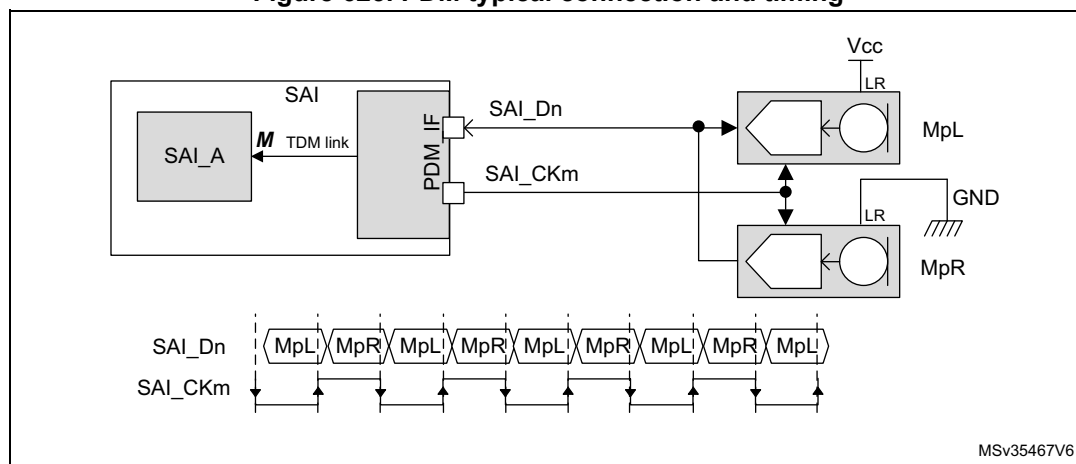

The FIFO pointers can be reinitialized when the SAI is disabled by setting bit FFLUSH in the SAI\_xCR2 register. If FFLUSH is set when the SAI is enabled the data present in the FIFO are lost automatically.

### 56.4.10 PDM interface

The PDM (Pulse Density Modulation) interface is provided in order to support digital microphones. Up to 4 digital microphone pairs can be connected in parallel. Depending on product implementation, less microphones can be supported (refer to [Section 56.3: SAI implementation](#)).

[Figure 623](#) shows a typical connection of a digital microphone pair via a PDM interface. Both microphones share the same bitstream clock and data line. Thanks to a configuration pin (LR), a microphone can provide valid data on SAI\_CK[m] rising edge while the other provides valid data on SAI\_CK[m] falling edge (m being the number of clock lines).

**Figure 623. PDM typical connection and timing**

1. n refers to the number of data lines and p to the number of microphone pairs.

The PDM function is intended to be used in conjunction with SAI\_A subblock configured in TDM master mode. It cannot be used with SAI\_B subblock. The PDM interface uses the timing signals provided by the TDM interface of SAI\_A and adapts them to generate a bitstream clock (SAI\_CK[m]).

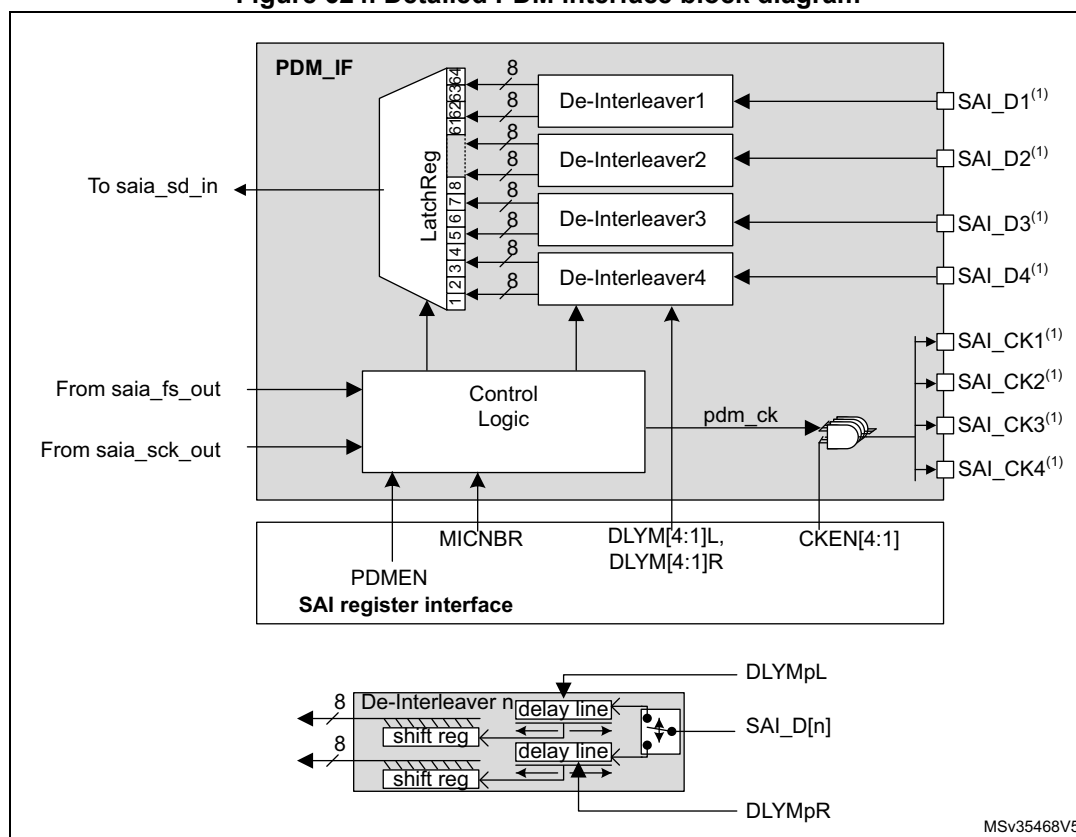

The data processing sequence into the PDM is the following:

1. The PDM interface builds the bitstream clock from the bit clock received from the TDM interface of SAI\_A.
2. The bitstream data received from the microphones (SAI\_D[n]) are de-interleaved and go through a 7-bit delay line in order to fine-tune the delay of each microphone with the accuracy of the bitstream clock.
3. The shift registers translate each serial bitstream into bytes.
4. The last operation consists in shifting-out the resulting bytes to SAI\_A via the serial data line of the TDM interface.

Figure 624 hereafter shows the block diagram of PDM interface, with a detailed view of a de-interleaver.

*Note:* The PDM interface does not embed the decimation filter required to build-up the PCM audio samples from the bitstream. It is up to the application software to perform this operation.

Figure 624. Detailed PDM interface block diagram

1. These signals might not be available in all SAI instances. Refer to [Section 56.3: SAI implementation](#) for details.
2. **n** refers to the number of data lines and **p** to the number of microphone pairs.

The PDM interface can be enabled through the PDMEN bit in SAI\_PDMCR register. However the PDM interface must be enabled prior to enabling SAI\_A block.

To reduce the memory footprint, the user can select the amount of microphones the application needs. This can be done through MICNBR[1:0] bits. It is possible to select

between 2,4,6 or 8 microphones. For example, if the application is using 3 microphones, the user has to select 4.

**Enabling the PDM interface**

To enable the PDM interface, follow the sequence below:

1. Configure SAI\_A in TDM master mode (see [Table 416](#)).
2. Configure the PDM interface as follows:
  - a) Define the number of digital microphones via MICNBR.
  - b) Enable the bitstream clock needed in the application by setting the corresponding bits on CKEN to 1.
3. Enable the PDM interface, via PDMEN bit.
4. Enable the SAI\_A.

*Note:* Once the PDM interface and SAI\_A are enabled, the first 2 TDMA frames received on SAI\_ADR are invalid and must be dropped.

**Start-up sequence**

[Figure 625](#) shows the start-up sequence: Once the PDM interface is enabled, it waits for the frame synchronization event prior to starting the acquisition of the microphone samples. After 8 SAI\_CLK clock periods, a data byte coming from each microphone is available, and transferred to the SAI, via the TDM interface.

**Figure 625. Start-up sequence**

MSv35469V3

**SAI\_ADR data format**

The arrangement of the data coming from the microphone into the SAI\_ADR register depends on the following parameters:

- The amount of microphones
- The slot width selected
- LSBFIRST bit.

The slot width defines the amount of significant bits into each word available into the SAI\_ADR.

When a slot width of 32 bits is selected, each data available into the SAI\_ADR contains 32 useful bits. This reduces the amount of words stored into the memory. However the counterpart is that the software has to perform some operations to de-interleave the data of each microphone.

In the other hand, when the slot width is set to 8 bits, each data available into the SAI\_ADR contain 8 useful bits. This increases the amount of words stored into the memory. However, it offers the advantage to avoid extra processing since each word contains information from one microphone.

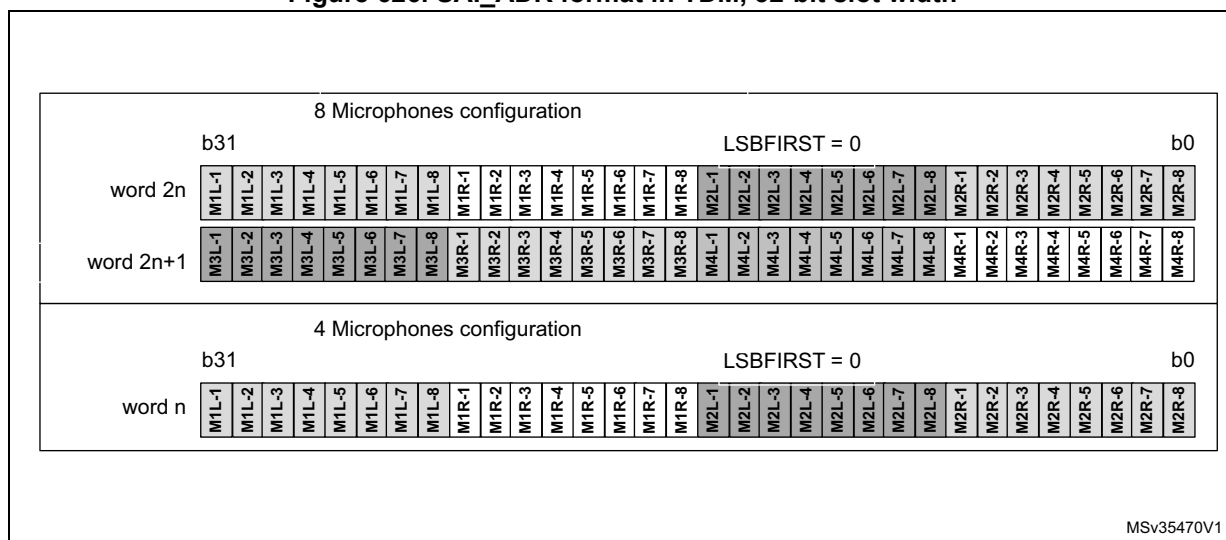

**SAI\_ADR data format example**

- **32-bit slot width** (DS = 0b111 and SLOTSZ = 0). Refer to [Figure 626](#).

For an 8 microphone configuration, two consecutive words read from the SAI\_ADR register contain a data byte from each microphone.

For a 4 microphones configuration, each word read from the SAI\_ADR register contains a data byte from each microphone.

**Figure 626. SAI\_ADR format in TDM, 32-bit slot width**

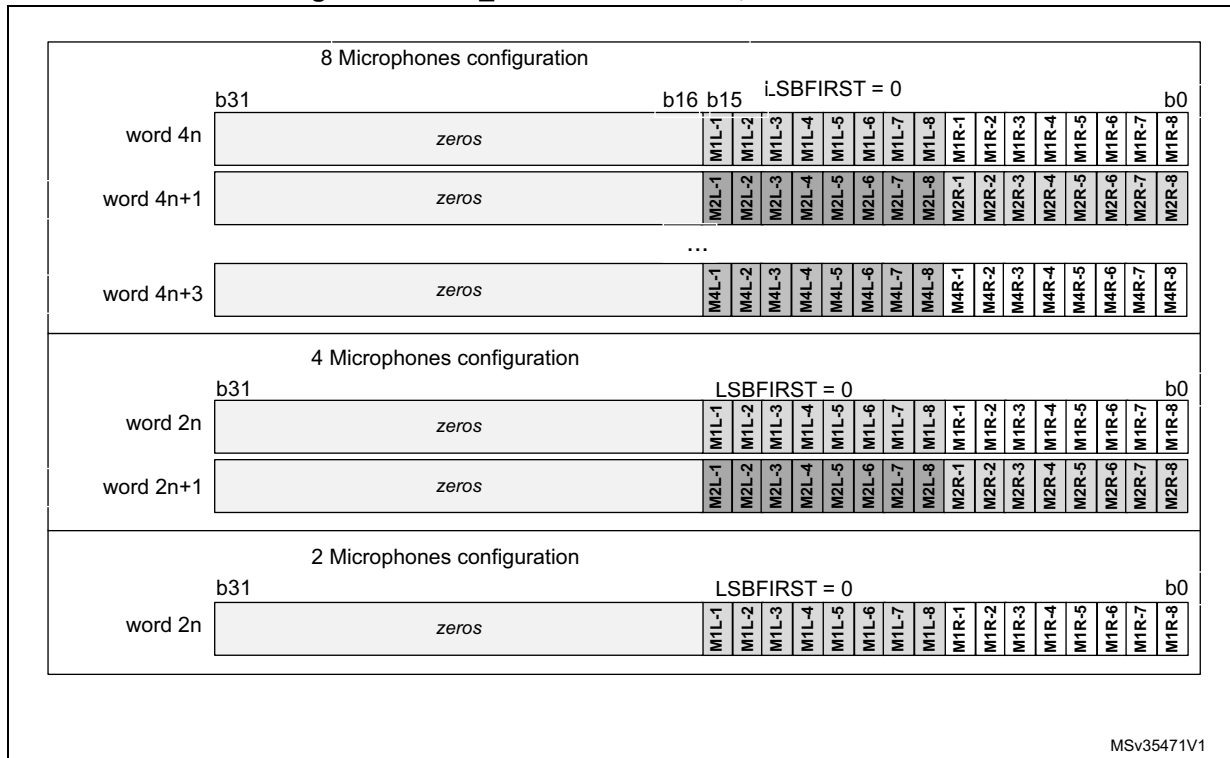

- **16-bit slot width** (DS = 0b100 and SLOTSZ = 0). Refer to [Figure 627](#).

For an 8 microphone configuration, four consecutive words read from the SAI\_ADR register contain a data byte from each microphone. Note that the 16-bit data of SAI\_ADR are right aligned.

For 4 or 2 microphone configuration, the SAI behavior is similar to 8-microphone configurations. Up to 2 words of 16 bits are required to acquire a byte from 4 microphones and a single word for 2 microphones.

Figure 627. SAI\_ADR format in TDM, 16-bit slot width

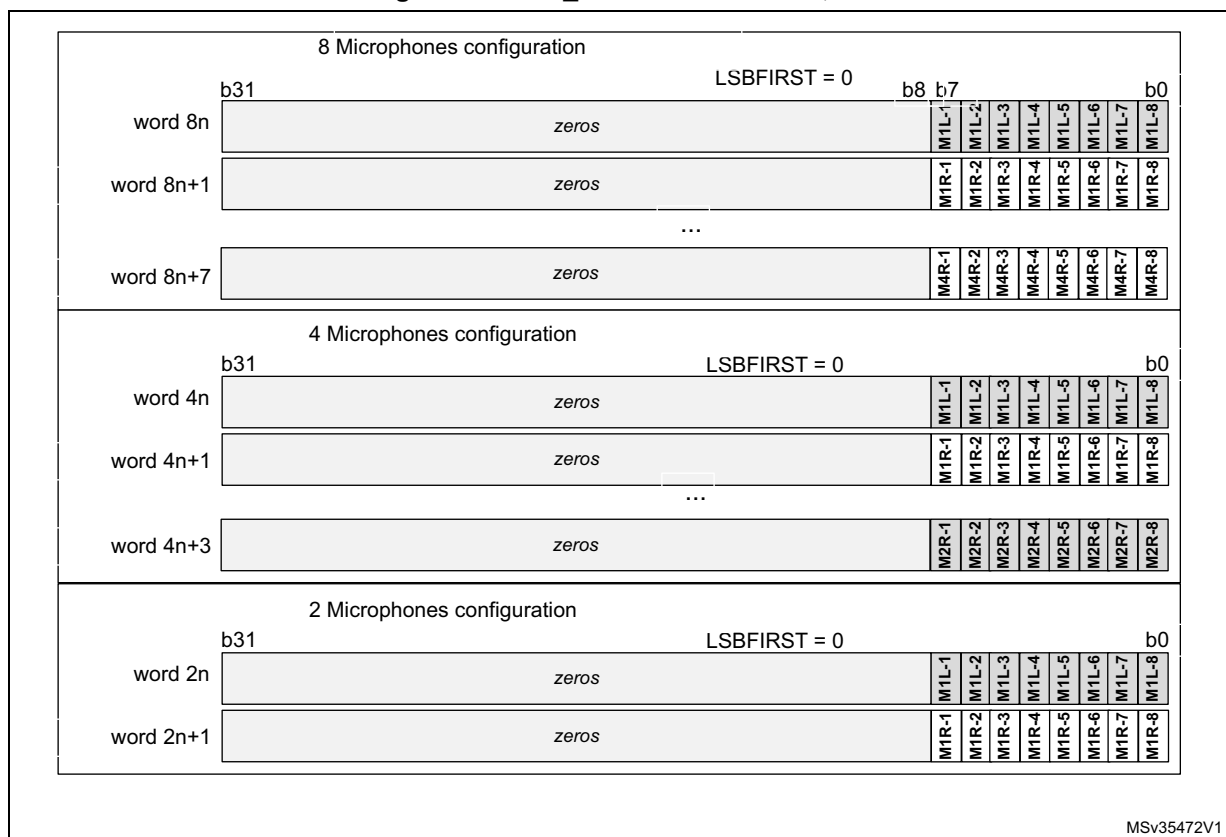

MSv35471V1

- Using a 8-bit slot width** (DS = 0b010 and SLOTSZ = 0). Refer to [Figure 628](#).  
 For an 8 microphone configuration, 8 consecutive words read from the SAI\_ADR register contain a byte of data from each microphone. Note that the 8-bit data of SAI\_ADR are right aligned.  
 For 4 or 2 microphone configuration, the SAI behavior is similar to 8 microphone configurations. Up to 4 words of 8 bits are required to acquire a byte from 4 microphones and 2 words from 2 microphones.

Figure 628. SAI\_ADR format in TDM, 8-bit slot width

### TDM configuration for PDM interface

SAI\_A TDM interface is internally connected to the PDM interface to get the microphone samples. The user application must configure the PDM interface as shown in [Table 416](#) to ensure a good connection with the PDM interface.

Table 416. TDM settings

Bit Fields	Values	Comments
MODE	0b01	Mode must be MASTER receiver
PRTCFCG	0b00	Free protocol for TDM
DS	X	To be adjusted according to the required data format, in accordance to the frame length and the number of slots (FRL and NBSLOT). See <a href="#">Table 417</a> .
LSBFIRST	X	This parameter can be used according to the wanted data format
CKSTR	0	Signal transitions occur on the rising edge of the SCK_A bit clock. Signals are stable on the falling edge of the bit clock.
MONO	0	Stereo mode
FRL	X	To be adjusted according to the number of microphones (MICNBR). See <a href="#">Table 417</a> .
FSALL	0	Pulse width is one bit clock cycle
FSDEF	0	FS signal is a start of frame

Table 416. TDM settings (continued)

Bit Fields	Values	Comments
FSPOL	1	FS is active High
FSOFF	0	FS is asserted on the first bit of slot 0
FBOFF	0	No offset on slot
SLOTSZ	0	Slot size = data size
NBSLOT	X	To be adjusted according to the required data format, in accordance to the slot size, and the frame length (FRL and DS). See <a href="#">Table 417</a> .
SLOTEN	X	To be adjusted according to NBSLOT
NODIV	1	No need to generate a master clock MCLK
MCKDIV	X	Depends on the frequency provided to sai_a_ker_ck input. This parameter must be adjusted to generate the proper bitstream clock frequency. See <a href="#">Table 417</a> .

### Adjusting the bitstream clock rate

To properly program the SAI TDM interface, the user application must take into account the settings given in [Table 416](#), and follow the below sequence:

1. Adjust the bit clock frequency ( $F_{SCK\_A}$ ) according to the required frequency for the PDM bitstream clock, using the following formula:

$$F_{SCK\_A} = F_{PDM\_CK} \times (MICNBR + 1) \times 2$$

MICNBR can be 0,1,2 or 3 (0 = 2 microphones., see [Section 56.6.18](#))

2. Set the frame length (FRL) using the following formula

$$FRL = (16 \times (MICNBR + 1)) - 1$$

3. Configure the slot size (DS) to a multiple of (FRL+1).

**Table 417. TDM frame configuration examples<sup>(1)(2)</sup>**

Microphone sampling rate	Nber of microphones	Wanted SAI_CK <sub>n</sub> frequency	bit clock (SCK_A) frequency	Frame sync. (FS_A) frequency	FRL	Ds	NBSLOT	Comments
48 kHz	up to 8	3.072 MHz	24.576 MHz	384 kHz	63	0b111	1	2 slots of 32 bits per frame
		3.072 MHz	24.576 MHz	384 kHz	63	0b100	3	4 slots of 16 bits per frame
		3.072 MHz	24.576 MHz	384 kHz	63	0b010	7	8 slots of 8 bits per frame
	up to 6	3.072 MHz	18.432 MHz	384 kHz	47	0b110	1	2 slots of 24 bits per frame
		3.072 MHz	18.432 MHz	384 kHz	47	0b100	2	3 slots of 16 bits per frame
		3.072 MHz	18.432 MHz	384 kHz	47	0b010	5	6 slots of 8 bits per frame
	up to 4	3.072 MHz	12.288 MHz	384 kHz	31	0b111	0	1 slot of 32 bits per frame
		3.072 MHz	12.288 MHz	384 kHz	31	0b100	1	2 slots of 16 bits per frame
		3.072 MHz	12.288 MHz	384 kHz	31	0b010	3	4 slots of 8 bits per frame
	up to 2	3.072 MHz	6.144 MHz	384 kHz	15	0b100	0	1 slots of 16 bits per frame
3.072 MHz		6.144 MHz	384 kHz	15	0b010	1	2 slots of 8 bits per frame	
16 kHz	up to 8	1.024 MHz	8.192 MHz	128 kHz	63	0b111	1	2 slots of 32 bits per frame
		1.024 MHz	8.192 MHz	128 kHz	63	0b100	3	4 slots of 16 bits per frame
		1.024 MHz	8.192 MHz	128 kHz	63	0b010	7	8 slots of 8 bits per frame
	up to 6	1.024 MHz	6.144 MHz	128 kHz	47	0b110	1	2 slots of 24 bits per frame
		1.024 MHz	6.144 MHz	128 kHz	47	0b010	5	6 slots of 8 bits per frame
		1.024 MHz	4.096 MHz	128 kHz	31	0b111	0	1 slot of 32 bits per frame
	up to 4	1.024 MHz	4.096 MHz	128 kHz	31	0b100	1	2 slots of 16 bits per frame
		1.024 MHz	4.096 MHz	128 kHz	31	0b010	3	4 slots of 8 bits per frame
		1.024 MHz	2.048 MHz	128 kHz	15	0b100	0	1 slot of 16 bits per frame
	up to 2	1.024 MHz	2.048 MHz	128 kHz	15	0b010	1	2 slots of 8 bits per frame

1. Refer to [Table 416: TDM settings](#) for additional information on TDM configuration. The sai\_a\_ker\_ck clock frequency provided to the SAI must be a multiple of the SCK\_A frequency, and MCKDIV should be programmed accordingly.
2. The above sai\_a\_ker\_ck frequencies are given as examples only. Refer to section *Reset and clock controller (RCC) to check if they can be generated on the device.*
3. The table above gives allowed settings for a decimation ratio of 64.

### Adjusting the delay lines

When the PDM interface is enabled, the application can adjust on-the-fly the delay cells of each microphone input via SAI\_PDMDLY register.

The new delays values become effective after two TDM frames.

### 56.4.11 AC'97 link controller

The SAI is able to work as an AC'97 link controller. In this protocol:

- The slot number and the slot size are fixed.
- The frame synchronization signal is perfectly defined and has a fixed shape.

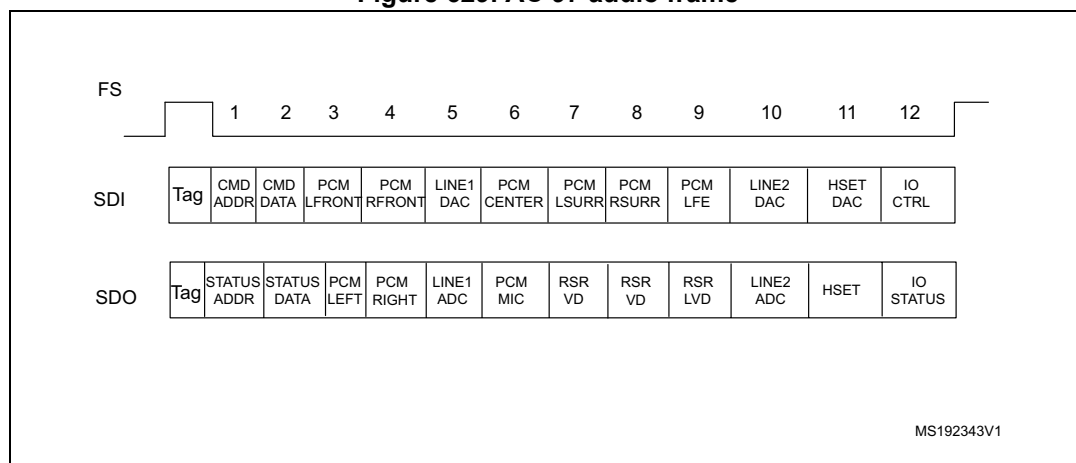

To select this protocol, set PRTCFCG[1:0] bits in the SAI\_xCR1 register to 10. When AC'97 mode is selected, only data sizes of 16 or 20 bits can be used, otherwise the SAI behavior is not guaranteed.

- NBSLOT[3:0] and SLOTSZ[1:0] bits are consequently ignored.
- The number of slots is fixed to 13 slots. The first one is 16-bit wide and all the others are 20-bit wide (data slots).
- FBOFF[4:0] bits in the SAI\_xSLOTR register are ignored.
- The SAI\_xFRCR register is ignored.
- The MCLK is not used.

The FS signal from the block defined as asynchronous is configured automatically as an output, since the AC'97 controller link drives the FS signal whatever the master or slave configuration.

Figure 629 shows an AC'97 audio frame structure.

Figure 629. AC'97 audio frame

Note: In AC'97 protocol, bit 2 of the tag is reserved (always 0), so bit 2 of the TAG is forced to 0 level whatever the value written in the SAI FIFO.

For more details about tag representation, refer to the AC'97 protocol standard.

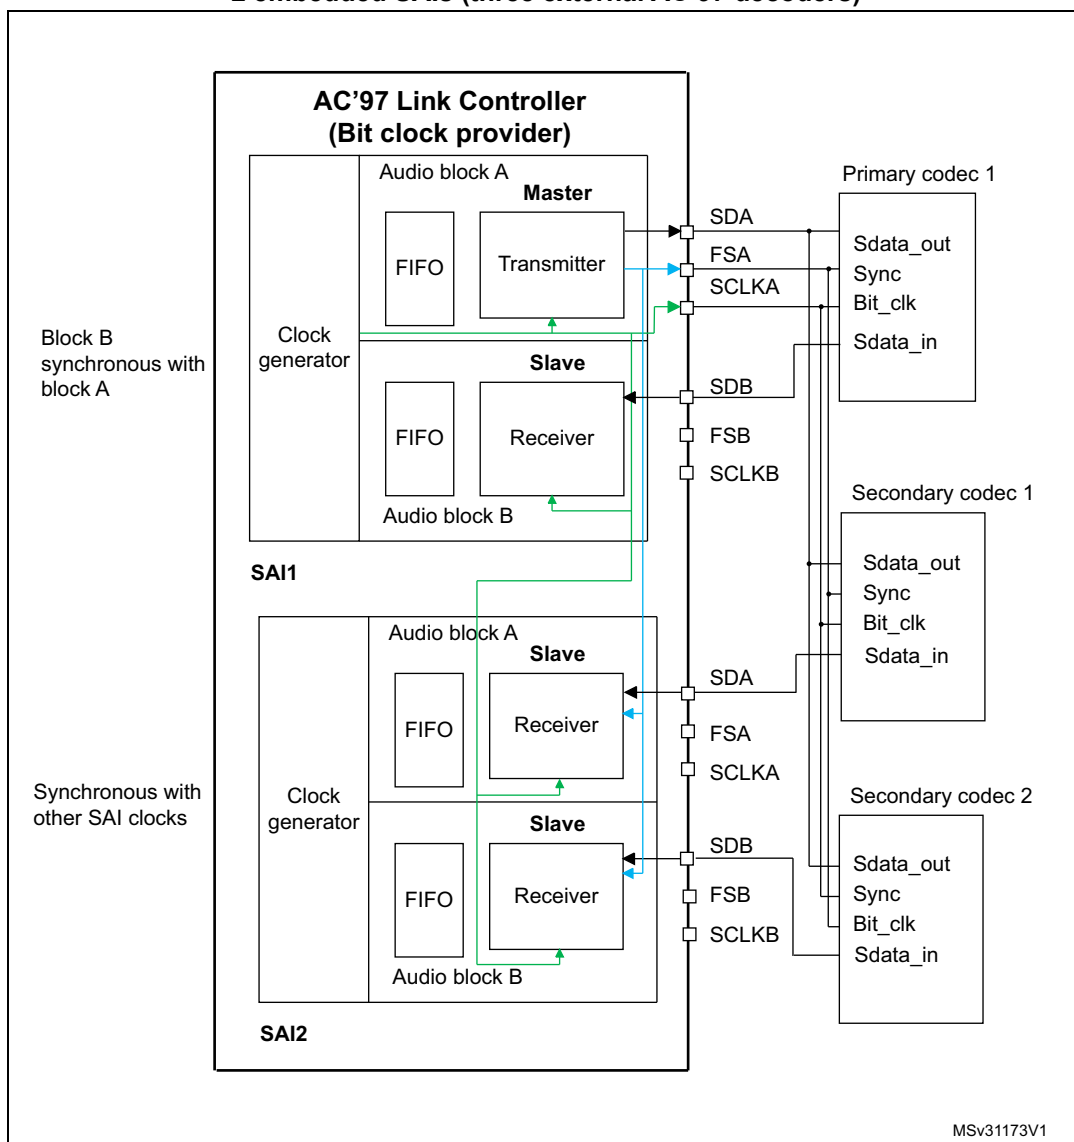

One SAI can be used to target an AC'97 point-to-point communication.

Using two SAIs (for devices featuring two embedded SAIs) enables the control of three external AC'97 decoders as illustrated in Figure 630.

In SAI1, the audio block A must be declared as asynchronous master transmitter whereas the audio block B is defined to be slave receiver and internally synchronous to the audio block A.

The SAI2 is configured for audio block A and B both synchronous with the external SAI1 in slave receiver mode.

**Figure 630. Example of typical AC'97 configuration on devices featuring at least 2 embedded SAIs (three external AC'97 decoders)**

In receiver mode, the SAI acting as an AC'97 link controller requires no FIFO request and so no data storage in the FIFO when the Codec ready bit in the slot 0 is decoded low. If bit CNRDYIE is enabled in the SAI\_xIM register, flag CNRDY is set in the SAI\_xSR register and an interrupt is generated. This flag is dedicated to the AC'97 protocol.

**Clock generator programming in AC'97 mode**

In AC'97 mode, the frame length is fixed at 256 bits, and its frequency must be set to 48 kHz. The formulas given in [Section 56.4.8: SAI clock generator](#) must be used with  $FRL = 255$ , in order to generate the proper frame rate ( $F_{FS\_x}$ ).

### 56.4.12 SPDIF output

The SPDIF interface is available in transmitter mode only. It supports the audio IEC60958.

To select SPDIF mode, set PRTCFCG[1:0] bit to 01 in the SAI\_xCR1 register.

For SPDIF protocol:

- Only SD data line is enabled.
- FS, SCK, MCLK I/Os pins are left free.
- MODE[1] bit is forced to 0 to select the master mode in order to enable the clock generator of the SAI and manage the data rate on the SD line.
- The data size is forced to 24 bits. The value set in DS[2:0] bits in the SAI\_xCR1 register is ignored.
- The clock generator must be configured to define the symbol-rate, knowing that the bit clock should be twice the symbol-rate. The data is coded in Manchester protocol.
- The SAI\_xFRCR and SAI\_xSLOTR registers are ignored. The SAI is configured internally to match the SPDIF protocol requirements as shown in [Figure 631](#).

Figure 631. SPDIF format

A SPDIF block contains 192 frames. Each frame is composed of two 32-bit sub-frames, generally one for the left channel and one for the right channel. Each sub-frame is composed of a SOPD pattern (4-bit) to specify if the sub-frame is the start of a block (and so is identifying a channel A) or if it is identifying a channel A somewhere in the block, or if it is referring to channel B (see [Table 418](#)). The next 28 bits of channel information are composed of 24 bits data + 4 status bits.

**Table 418. SOPD pattern**

SOPD	Preamble coding		Description
	last bit is 0	last bit is 1	
B	11101000	00010111	Channel A data at the start of block
W	11100100	00011011	Channel B data somewhere in the block
M	11100010	00011101	Channel A data

The data stored in SAI\_xDR has to be filled as follows:

- SAI\_xDR[26:24] contain the Channel status, User and Validity bits.
- SAI\_xDR[23:0] contain the 24-bit data for the considered channel.

If the data size is 20 bits, then data must be mapped on SAI\_xDR[23:4].

If the data size is 16 bits, then data must be mapped on SAI\_xDR[23:8].

SAI\_xDR[23] always represents the MSB.

**Figure 632. SAI\_xDR register ordering**

*Note:* The transfer is performed always with LSB first.

The SAI first sends the adequate preamble for each sub-frame in a block. The SAI\_xDR is then sent on the SD line (manchester coded). The SAI ends the sub-frame by transferring the Parity bit calculated as described in [Table 419](#).

**Table 419. Parity bit calculation**

SAI_xDR[26:0]	Parity bit P value transferred
odd number of 0	0
odd number of 1	1

The underrun is the only error flag available in the SAI\_xSR register for SPDIF mode since the SAI can only operate in transmitter mode. As a result, the following sequence should be

executed to recover from an underrun error detected via the underrun interrupt or the underrun status bit:

1. Disable the DMA stream (via the DMA peripheral) if the DMA is used.
2. Disable the SAI and check that the peripheral is physically disabled by polling the SAIEN bit in SAI\_xCR1 register.
3. Clear the COVRUNDR flag in the SAI\_xCLRFR register.
4. Flush the FIFO by setting the FFLUSH bit in SAI\_xCR2.

The software needs to point to the address of the future data corresponding to a start of new block (data for preamble B). If the DMA is used, the DMA source base address pointer should be updated accordingly.

5. Enable again the DMA stream (DMA peripheral) if the DMA used to manage data transfers according to the new source base address.
6. Enable again the SAI by setting SAIEN bit in SAI\_xCR1 register.

**Clock generator programming in SPDIF generator mode**

For the SPDIF generator, the SAI provides a bit clock twice faster as the symbol-rate. The table hereafter shows usual examples of symbol rates with respect to the audio sampling rate.

**Table 420. Audio sampling frequency versus symbol rates**

Audio sampling frequencies (F <sub>S</sub> )	Symbol-rate
44.1 kHz	2.8224 MHz
48 kHz	3.072 MHz
96 kHz	6.144 MHz
192 kHz	12.288 MHz

More generally, the relationship between the audio sampling frequency (F<sub>S</sub>) and the bit clock rate (F<sub>SCK\_x</sub>) is given by the formula:

$$F_S = \frac{F_{SCK\_x}}{128}$$

The bit clock rate is obtained as follows:

$$F_{SCK\_x} = \frac{F_{sai\_x\_ker\_ck}}{MCKDIV}$$

*Note:* The above formulas are valid only if NODIV is set to 1 in SAI\_ACR1 register.

### 56.4.13 Specific features

The SAI interface embeds specific features which can be useful depending on the audio protocol selected. These functions are accessible through specific bits of the SAI\_xCR2 register.

#### Mute mode

The mute mode can be used when the audio subblock is a transmitter or a receiver.

#### Audio subblock in transmission mode

In transmitter mode, the mute mode can be selected at anytime. The mute mode is active for entire audio frames. The MUTE bit in the SAI\_xCR2 register enables the mute mode when it is set during an ongoing frame.

The mute mode bit is strobed only at the end of the frame. If it is set at this time, the mute mode is active at the beginning of the new audio frame and for a complete frame, until the next end of frame. The bit is then strobed to determine if the next frame is still a mute frame.

If the number of slots set through NBSLOT[3:0] bits in the SAI\_xSLOTR register is lower than or equal to 2, it is possible to specify if the value sent in mute mode is 0 or if it is the last value of each slot. The selection is done via MUTEVAL bit in the SAI\_xCR2 register.

If the number of slots set in NBSLOT[3:0] bits in the SAI\_xSLOTR register is greater than 2, MUTEVAL bit in the SAI\_xCR2 is meaningless as 0 values are sent on each bit on each slot.

The FIFO pointers are still incremented in mute mode. This means that data present in the FIFO and for which the mute mode is requested are discarded.

#### Audio subblock in reception mode

In reception mode, it is possible to detect a mute mode sent from the external transmitter when all the declared and valid slots of the audio frame receive 0 for a given consecutive number of audio frames (MUTECNT[5:0] bits in the SAI\_xCR2 register).

When the number of MUTE frames is detected, the MUTEDET flag in the SAI\_xSR register is set and an interrupt can be generated if MUTEDETIE bit is set in SAI\_xCR2.

The mute frame counter is cleared when the audio subblock is disabled or when a valid slot receives at least one data in an audio frame. The interrupt is generated just once, when the counter reaches the value specified in MUTECNT[5:0] bits. The interrupt event is then reinitialized when the counter is cleared.

*Note:* The mute mode is not available for SPDIF audio blocks.

#### Mono/stereo mode

In transmitter mode, the mono mode can be addressed, without any data preprocessing in memory, assuming the number of slots is equal to 2 (NBSLOT[3:0] = 0001 in SAI\_xSLOTR). In this case, the access time to and from the FIFO is reduced by 2 since the data for slot 0 is duplicated into data slot 1.

To enable the mono mode,

1. Set MONO bit to 1 in the SAI\_xCR1 register.
2. Set NBSLOT to 1 and SLOTEN to 3 in SAI\_xSLOTR.

In reception mode, the MONO bit can be set and is meaningful only if the number of slots is equal to 2 as in transmitter mode. When it is set, only slot 0 data are stored in the FIFO. The data belonging to slot 1 are discarded since, in this case, it is supposed to be the same as the previous slot. If the data flow in reception mode is a real stereo audio flow with a distinct and different left and right data, the MONO bit is meaningless. The conversion from the output stereo file to the equivalent mono file is done by software.

### Companding mode

Telecommunication applications can require to process the data to be transmitted or received using a data companding algorithm.

Depending on the COMP[1:0] bits in the SAI\_xCR2 register (used only when Free protocol mode is selected), the application software can choose to process or not the data before sending it on SD serial output line (compression) or to expand the data after the reception on SD serial input line (expansion) as illustrated in [Figure 633](#). The two companding modes supported are the  $\mu$ -Law and the A-Law log which are a part of the CCITT G.711 recommendation.

The companding standard used in the United States and Japan is the  $\mu$ -Law. It supports 14 bits of dynamic range (COMP[1:0] = 10 in the SAI\_xCR2 register).

The European companding standard is A-Law and supports 13 bits of dynamic range (COMP[1:0] = 11 in the SAI\_xCR2 register).

Both  $\mu$ -Law or A-Law companding standard can be computed based on 1's complement or 2's complement representation depending on the CPL bit setting in the SAI\_xCR2 register.

In  $\mu$ -Law and A-Law standards, data are coded as 8 bits with MSB alignment. Companded data are always 8-bit wide. For this reason, DS[2:0] bits in the SAI\_xCR1 register are forced to 010 when the SAI audio block is enabled (SAIEN bit = 1 in the SAI\_xCR1 register) and when one of these two companding modes selected through the COMP[1:0] bits.

If no companding processing is required, COMP[1:0] bits should be kept clear.

Figure 633. Data companding hardware in an audio block in the SAI

1. Not applicable when AC'97 or SPDIF are selected.

Expansion and compression mode are automatically selected through the SAI\_xCR2:

- If the SAI audio block is configured to be a transmitter, and if the COMP[1] bit is set in the SAI\_xCR2 register, the compression mode is applied.
- If the SAI audio block is declared as a receiver, the expansion algorithm is applied.

### Output data line management on an inactive slot

In transmitter mode, it is possible to choose the behavior of the SD line output when an inactive slot is sent on the data line (via TRIS bit).

- Either the SAI forces 0 on the SD output line when an inactive slot is transmitted, or
- The line is released in HI-z state at the end of the last bit of data transferred, to release the line for other transmitters connected to this node.

It is important to note that the two transmitters cannot attempt to drive the same SD output pin simultaneously, which may result in a short circuit. To ensure a gap between transmissions, if the data is lower than 32-bit, the data can be extended to 32-bit by setting bit SLOTSZ[1:0] = 10 in the SAI\_xSLOTR register. The SD output pin is then tri-stated at the end of the LSB of the active slot (during the padding to 0 phase to extend the data to 32-bit) if the following slot is declared inactive.

In addition, if the number of slots multiplied by the slot size is lower than the frame length, the SD output line is tri-stated when the padding to 0 is done to complete the audio frame.

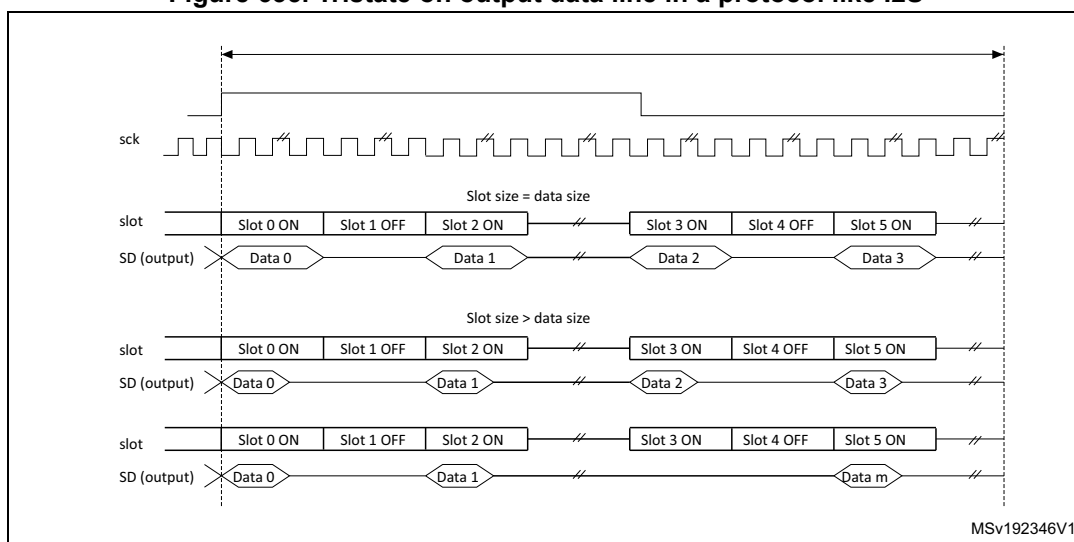

[Figure 634](#) illustrates these behaviors.

Figure 634. Tristate strategy on SD output line on an inactive slot

When the selected audio protocol uses the FS signal as a start of frame and a channel side identification (bit FSDEF = 1 in the SAI\_xFRCR register), the tristate mode is managed according to [Figure 635](#) (where bit TRIS in the SAI\_xCR1 register = 1, and FSDEF=1, and half frame length is higher than number of slots/2, and NBSLOT=6).

Figure 635. Tristate on output data line in a protocol like I2S

If the TRIS bit in the SAI\_xCR2 register is cleared, all the High impedance states on the SD output line on [Figure 634](#) and [Figure 635](#) are replaced by a drive with a value of 0.

#### 56.4.14 Error flags

The SAI implements the following error flags:

- FIFO overrun/underrun
- Anticipated frame synchronization detection
- Late frame synchronization detection
- Codec not ready (AC'97 exclusively)
- Wrong clock configuration in master mode.

##### FIFO overrun/underrun (OVRUDR)

The FIFO overrun/underrun bit is called OVRUDR in the SAI\_xSR register.

The overrun or underrun errors share the same bit since an audio block can be either receiver or transmitter and each audio block in a given SAI has its own SAI\_xSR register.

##### Overrun

When the audio block is configured as receiver, an overrun condition may appear if data are received in an audio frame when the FIFO is full and not able to store the received data. In this case, the received data are lost, the flag OVRUDR in the SAI\_xSR register is set and an interrupt is generated if OVRUDRIE bit is set in the SAI\_xIM register. The slot number, from which the overrun occurs, is stored internally. No more data are stored into the FIFO until it becomes free to store new data. When the FIFO has at least one data free, the SAI audio block receiver stores new data (from new audio frame) from the slot number which was stored internally when the overrun condition was detected. This avoids data slot de-alignment in the destination memory (refer to [Figure 636](#)).

The OVRUDR flag is cleared when COVRUDR bit is set in the SAI\_xCLRFR register.

Figure 636. Overrun detection error

**Underrun**

An underrun may occur when the audio block in the SAI is a transmitter and the FIFO is empty when data need to be transmitted. If an underrun is detected, the slot number for which the event occurs is stored and MUTE value (00) is sent until the FIFO is ready to transmit the data corresponding to the slot for which the underrun was detected (refer to [Figure 637](#)). This avoids desynchronization between the memory pointer and the slot in the audio frame.

The underrun event sets the OVRUDR flag in the SAI\_xSR register and an interrupt is generated if the OVRUDRIE bit is set in the SAI\_xIM register. To clear this flag, set COVRUDR bit in the SAI\_xCLRFR register.

The underrun event can occur when the audio subblock is configured as master or slave.

Figure 637. FIFO underrun event

### Anticipated frame synchronization detection (AFSDET)

The AFSDET flag is used only in slave mode. It is never asserted in master mode. It indicates that a frame synchronization (FS) has been detected earlier than expected since the frame length, the frame polarity, the frame offset are defined and known.

Anticipated frame detection sets the AFSDET flag in the SAI\_xSR register.

This detection has no effect on the current audio frame which is not sensitive to the anticipated FS. This means that “parasitic” events on signal FS are flagged without any perturbation of the current audio frame.

An interrupt is generated if the AFSDETIE bit is set in the SAI\_xIM register. To clear the AFSDET flag, CAFSDET bit must be set in the SAI\_xCLRFR register.

To resynchronize with the master after an anticipated frame detection error, four steps are required:

1. Disable the SAI block by resetting SAIEN bit in SAI\_xCR1 register. To make sure the SAI is disabled, read back the SAIEN bit and check it is set to 0.
2. Flush the FIFO via FFLUS bit in SAI\_xCR2 register.
3. Enable again the SAI peripheral (SAIEN bit set to 1).
4. The SAI block waits for the assertion on FS to restart the synchronization with master.

*Note: The AFSDET flag is not asserted in AC'97 mode since the SAI audio block acts as a link controller and generates the FS signal even when declared as slave. It has no meaning in SPDIF mode since the FS signal is not used.*

### Late frame synchronization detection

The LFSDET flag in the SAI\_xSR register can be set only when the SAI audio block operates as a slave. The frame length, the frame polarity and the frame offset configuration are known in register SAI\_xFRCR.

If the external master does not send the FS signal at the expecting time thus generating the signal too late, the LFSDET flag is set and an interrupt is generated if LFSDETIE bit is set in the SAI\_xIM register.

The LFSDET flag is cleared when CLFSDET bit is set in the SAI\_xCLRFR register.

The late frame synchronization detection flag is set when the corresponding error is detected. The SAI needs to be resynchronized with the master (see sequence described in [Anticipated frame synchronization detection \(AFSDET\)](#)).

In a noisy environment, glitches on the SCK clock may be wrongly detected by the audio block state machine and shift the SAI data at a wrong frame position. This event can be detected by the SAI and reported as a late frame synchronization detection error.

There is no corruption if the external master is not managing the audio data frame transfer in continuous mode, which should not be the case in most applications. In this case, the LFSDET flag is set.

*Note: The LFSDET flag is not asserted in AC'97 mode since the SAI audio block acts as a link controller and generates the FS signal even when declared as slave. It has no meaning in SPDIF mode since the signal FS is not used by the protocol.*

### Codec not ready (CNRDY AC'97)

The CNRDY flag in the SAI\_xSR register is relevant only if the SAI audio block is configured to operate in AC'97 mode (PRTCFCFG[1:0] = 10 in the SAI\_xCR1 register). If CNRDYIE bit is set in the SAI\_xIM register, an interrupt is generated when the CNRDY flag is set.

CNRDY is asserted when the Codec is not ready to communicate during the reception of the TAG 0 (slot0) of the AC'97 audio frame. In this case, no data are automatically stored into the FIFO since the Codec is not ready, until the TAG 0 indicates that the Codec is ready. All the active slots defined in the SAI\_xSLOTR register are captured when the Codec is ready.

To clear CNRDY flag, CCNRDY bit must be set in the SAI\_xCLRFR register.

### Wrong clock configuration in master mode (with NODIV = 0)

When the audio block operates as a master (MODE[1] = 0) and NODIV bit is equal to 0, the WCKCFG flag is set as soon as the SAI is enabled if the following conditions are met:

- (FRL+1) is not a power of 2, and
- (FRL+1) is not between 8 and 256.

MODE, NODIV, and SAIEN bits belong to SAI\_xCR1 register and FRL to SAI\_xFRCR register.

If WCKCFGIE bit is set, an interrupt is generated when WCKCFG flag is set in the SAI\_xSR register. To clear this flag, set CWCKCFG bit in the SAI\_xCLRFR register.

When WCKCFG bit is set, the audio block is automatically disabled, thus performing a hardware clear of SAIEN bit.

## 56.4.15 Disabling the SAI

The SAI audio block can be disabled at any moment by clearing SAIEN bit in the SAI\_xCR1 register. All the already started frames are automatically completed before the SAI is stops working. SAIEN bit remains High until the SAI is completely switched-off at the end of the current audio frame transfer.

If an audio block in the SAI operates synchronously with the other one, the one which is the master must be disabled first.

## 56.4.16 SAI DMA interface

To free the CPU and to optimize bus bandwidth, each SAI audio block has an independent DMA interface to read/write from/to the SAI\_xDR register (to access the internal FIFO). There is one DMA channel per audio subblock supporting basic DMA request/acknowledge protocol.

To configure the audio subblock for DMA transfer, set DMAEN bit in the SAI\_xCR1 register. The DMA request is managed directly by the FIFO controller depending on the FIFO threshold level (for more details refer to [Section 56.4.9: Internal FIFOs](#)). DMA transfer direction is linked to the SAI audio subblock configuration:

- If the audio block operates as a transmitter, the audio block FIFO controller outputs a DMA request to load the FIFO with data written in the SAI\_xDR register.
- If the audio block is operates as a receiver, the DMA request is related to read operations from the SAI\_xDR register.

Follow the sequence below to configure the SAI interface in DMA mode:

1. Configure SAI and FIFO threshold levels to specify when the DMA request is launched.
2. Configure SAI DMA channel.
3. Enable the DMA.
4. Enable the SAI interface.

*Note:* Before configuring the SAI block, the SAI DMA channel must be disabled.

## 56.5 SAI interrupts

The SAI supports 7 interrupt sources as shown in [Table 421](#).

**Table 421. SAI interrupt sources**

Interrupt acronym	Interrupt source	Interrupt group	Audio block mode	Interrupt enable	Interrupt clear
SAI	FREQ	FREQ	Master or slave Receiver or transmitter	FREQIE in SAI_xIM register	Depends on: – FIFO threshold setting (FLVL bits in SAI_xCR2) – Communication direction (transmitter or receiver)  For more details refer to <a href="#">Section 56.4.9: Internal FIFOs</a>
	OVRUDR	ERROR	Master or slave Receiver or transmitter	OVRUDRIE in SAI_xIM register	COVRUDR = 1 in SAI_xCLRFR register
	AFSDDET	ERROR	Slave (not used in AC'97 mode and SPDIF mode)	AFSDDETIE in SAI_xIM register	CAFSDDET = 1 in SAI_xCLRFR register
	LFSDDT	ERROR	Slave (not used in AC'97 mode and SPDIF mode)	LFSDDTIE in SAI_xIM register	CLFSDDT = 1 in SAI_xCLRFR register
	CNRDY	ERROR	Slave (only in AC'97 mode)	CNRDYIE in SAI_xIM register	CCNRDY = 1 in SAI_xCLRFR register
	MUTEDET	MUTE	Master or slave Receiver mode only	MUTEDETIE in SAI_xIM register	CMUTEDET = 1 in SAI_xCLRFR register
	WCKCFG	ERROR	Master with NODIV = 0 in SAI_xCR1 register	WCKCFGIE in SAI_xIM register	CWCKCFG = 1 in SAI_xCLRFR register

Follow the sequence below to enable an interrupt:

1. Disable SAI interrupt.
2. Configure SAI.
3. Configure SAI interrupt source.
4. Enable SAI.

## 56.6 SAI registers

The peripheral registers have to be accessed by words (32 bits).

### 56.6.1 SAI global configuration register (SAI\_GCR)

Address offset: 0x00

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SYNCOUT[1:0]		Res.	Res.	SYNCIN[1:0]	
										rw	rw			rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:4 **SYNCOUT[1:0]**: Synchronization outputs

These bits are set and cleared by software.

00: No synchronization output signals. SYNCOUT[1:0] should be configured as “No synchronization output signals” when audio block is configured as SPDIF

01: Block A used for further synchronization for others SAI

10: Block B used for further synchronization for others SAI

11: Reserved. These bits must be set when both audio block (A and B) are disabled.

Bits 3:2 Reserved, must be kept at reset value.

Bits 1:0 **SYNCIN[1:0]**: Synchronization inputs

These bits are set and cleared by software.

Refer to [Table 413: External synchronization selection](#) for information on how to program this field.

These bits must be set when both audio blocks (A and B) are disabled.

They are meaningful if one of the two audio blocks is defined to operate in synchronous mode with an external SAI (SYNCEN[1:0] = 10 in SAI\_ACR1 or in SAI\_BCR1 registers).

### 56.6.2 SAI configuration register 1 (SAI\_ACR1)

Address offset: 0x004

Reset value: 0x0000 0040

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res	Res.	Res.	Res.	MCK EN	OSR	MCKDIV[5:0]					NODIV	Res.	DMAEN	SAIEN	
				rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res	Res.	OUTDRIV	MONO	SYNCEN[1:0]	CKSTR	LSBFIRST	DS[2:0]			Res.	PRTCFCG[1:0]	MODE[1:0]			
		rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **MCKEN**: Master clock generation enable

0: The master clock is not generated

1: The master clock is generated independently of SAIEN bit

Bit 26 **OSR**: Oversampling ratio for master clock

This bit is meaningful only when NODIV bit is set to 0.

0: Master clock frequency =  $F_{FS} \times 256$

1: Master clock frequency =  $F_{FS} \times 512$

Bits 25:20 **MCKDIV[5:0]**: Master clock divider

These bits are set and cleared by software.

000000: Divides by 1 the kernel clock input (sai\_x\_ker\_ck).

Otherwise, The master clock frequency is calculated according to the formula given in [Section 56.4.8: SAI clock generator](#).

These bits have no meaning when the audio block is slave.

They have to be configured when the audio block is disabled.

Bit 19 **NODIV**: No divider

This bit is set and cleared by software.

0: the ratio between the Master clock generator and frame synchronization is fixed to 256 or 512

1: the ratio between the Master clock generator and frame synchronization depends on FRL[7:0]

Bit 18 Reserved, must be kept at reset value.

Bit 17 **DMAEN**: DMA enable

This bit is set and cleared by software.

0: DMA disabled

1: DMA enabled

*Note: Since the audio block defaults to operate as a transmitter after reset, the MODE[1:0] bits must be configured before setting DMAEN to avoid a DMA request in receiver mode.*

**Bit 16 SAIEN:** Audio block enable

This bit is set by software.

To switch off the audio block, the application software must program this bit to 0 and poll the bit till it reads back 0, meaning that the block is completely disabled. Before setting this bit to 1, check that it is set to 0, otherwise the enable command is not taken into account.

This bit enables to control the state of the SAI audio block. If it is disabled when an audio frame transfer is ongoing, the ongoing transfer completes and the cell is fully disabled at the end of this audio frame transfer.

0: SAI audio block disabled

1: SAI audio block enabled.

*Note: When the SAI block (A or B) is configured in master mode, the clock must be present on the SAI block input before setting SAIEN bit.*

Bits 15:14 Reserved, must be kept at reset value.

**Bit 13 OUTDRIV:** Output drive

This bit is set and cleared by software.

0: Audio block output driven when SAIEN is set

1: Audio block output driven immediately after the setting of this bit.

*Note: This bit has to be set before enabling the audio block and after the audio block configuration.*

**Bit 12 MONO:** Mono mode

This bit is set and cleared by software. It is meaningful only when the number of slots is equal to 2. When the mono mode is selected, slot 0 data are duplicated on slot 1 when the audio block operates as a transmitter. In reception mode, the slot1 is discarded and only the data received from slot 0 are stored. Refer to [Section : Mono/stereo mode](#) for more details.

0: Stereo mode

1: Mono mode.

**Bits 11:10 SYNCEN[1:0]:** Synchronization enable

These bits are set and cleared by software. They must be configured when the audio subblock is disabled.

00: audio subblock in asynchronous mode.

01: audio subblock is synchronous with the other internal audio subblock. In this case, the audio subblock must be configured in slave mode

10: audio subblock is synchronous with an external SAI embedded peripheral. In this case the audio subblock should be configured in Slave mode.

11: Reserved

*Note: The audio subblock should be configured as asynchronous when SPDIF mode is enabled.*

**Bit 9 CKSTR:** Clock strobing edge

This bit is set and cleared by software. It must be configured when the audio block is disabled. This bit has no meaning in SPDIF audio protocol.

0: Signals generated by the SAI change on SCK rising edge, while signals received by the SAI are sampled on the SCK falling edge.

1: Signals generated by the SAI change on SCK falling edge, while signals received by the SAI are sampled on the SCK rising edge.

**Bit 8 LSBFIRST:** Least significant bit first

This bit is set and cleared by software. It must be configured when the audio block is disabled. This bit has no meaning in AC'97 audio protocol since AC'97 data are always transferred with the MSB first. This bit has no meaning in SPDIF audio protocol since in SPDIF data are always transferred with LSB first.

0: Data are transferred with MSB first

1: Data are transferred with LSB first

Bits 7:5 **DS[2:0]**: Data size

These bits are set and cleared by software. These bits are ignored when the SPDIF protocols are selected (bit PRTCFCG[1:0]), because the frame and the data size are fixed in such case. When the companding mode is selected through COMP[1:0] bits, DS[1:0] are ignored since the data size is fixed to 8 bits by the algorithm.

These bits must be configured when the audio block is disabled.

- 000: Reserved
- 001: Reserved
- 010: 8 bits
- 011: 10 bits
- 100: 16 bits
- 101: 20 bits
- 110: 24 bits
- 111: 32 bits

Bit 4 Reserved, must be kept at reset value.

Bits 3:2 **PRTCFCG[1:0]**: Protocol configuration

These bits are set and cleared by software. These bits have to be configured when the audio block is disabled.

00: Free protocol. Free protocol enables to use the powerful configuration of the audio block to address a specific audio protocol (such as I2S, LSB/MSB justified, TDM, PCM/DSP...) by setting most of the configuration register bits as well as frame configuration register.

- 01: SPDIF protocol
- 10: AC'97 protocol
- 11: Reserved

Bits 1:0 **MODE[1:0]**: SAIx audio block mode

These bits are set and cleared by software. They must be configured when SAIx audio block is disabled.

- 00: Master transmitter
- 01: Master receiver
- 10: Slave transmitter
- 11: Slave receiver

*Note: When the audio block is configured in SPDIF mode, the master transmitter mode is forced (MODE[1:0] = 00).*

### 56.6.3 SAI configuration register 1 (SAI\_BCR1)

Address offset: 0x024

Reset value: 0x0000 0040

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res	Res	OUTD RIV	MONO	SYNCEN[1:0]		CKSTR	LSBFIRST	DS[2:0]			Res	PRTCFCG[1:0]		MODE[1:0]	
		rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **MCKEN**: Master clock generation enable

0: The master clock is not generated

1: The master clock is generated independently of SAIEN bit

Bit 26 **OSR**: Oversampling ratio for master clock

This bit is meaningful only when NODIV bit is set to 0.

0: Master clock frequency =  $F_{FS} \times 256$

1: Master clock frequency =  $F_{FS} \times 512$

Bits 25:20 **MCKDIV[5:0]**: Master clock divider

These bits are set and cleared by software.

000000: Divides by 1 the kernel clock input (sai\_x\_ker\_ck).

Otherwise, The master clock frequency is calculated according to the formula given in [Section 56.4.8: SAI clock generator](#).

These bits have no meaning when the audio block is slave.

They have to be configured when the audio block is disabled.

Bit 19 **NODIV**: No divider

This bit is set and cleared by software.

0: the ratio between the Master clock generator and frame synchronization is fixed to 256 or 512

1: the ratio between the Master clock generator and frame synchronization depends on FRL[7:0]

Bit 18 Reserved, must be kept at reset value.

Bit 17 **DMAEN**: DMA enable

This bit is set and cleared by software.

0: DMA disabled

1: DMA enabled

*Note: Since the audio block defaults to operate as a transmitter after reset, the MODE[1:0] bits must be configured before setting DMAEN to avoid a DMA request in receiver mode.*

Bit 16 **SAIEN**: Audio block enable

This bit is set by software.

To switch off the audio block, the application software must program this bit to 0 and poll the bit till it reads back 0, meaning that the block is completely disabled. Before setting this bit to 1, check that it is set to 0, otherwise the enable command is not taken into account.

This bit enables to control the state of the SAI audio block. If it is disabled when an audio frame transfer is ongoing, the ongoing transfer completes and the cell is fully disabled at the end of this audio frame transfer.

0: SAI audio block disabled

1: SAI audio block enabled.

*Note: When the SAI block (A or B) is configured in master mode, the clock must be present on the SAI block input before setting SAIEN bit.*

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **OUTDRIV**: Output drive

This bit is set and cleared by software.

0: Audio block output driven when SAIEN is set

1: Audio block output driven immediately after the setting of this bit.

*Note: This bit has to be set before enabling the audio block and after the audio block configuration.*

**Bit 12 MONO:** Mono mode

This bit is set and cleared by software. It is meaningful only when the number of slots is equal to 2. When the mono mode is selected, slot 0 data are duplicated on slot 1 when the audio block operates as a transmitter. In reception mode, the slot1 is discarded and only the data received from slot 0 are stored. Refer to [Section : Mono/stereo mode](#) for more details.

- 0: Stereo mode
- 1: Mono mode.

**Bits 11:10 SYNCEN[1:0]:** Synchronization enable

These bits are set and cleared by software. They must be configured when the audio subblock is disabled.

- 00: audio subblock in asynchronous mode.
- 01: audio subblock is synchronous with the other internal audio subblock. In this case, the audio subblock must be configured in slave mode
- 10: audio subblock is synchronous with an external SAI embedded peripheral. In this case the audio subblock should be configured in Slave mode.
- 11: Reserved

*Note: The audio subblock should be configured as asynchronous when SPDIF mode is enabled.*

**Bit 9 CKSTR:** Clock strobing edge

This bit is set and cleared by software. It must be configured when the audio block is disabled. This bit has no meaning in SPDIF audio protocol.

- 0: Signals generated by the SAI change on SCK rising edge, while signals received by the SAI are sampled on the SCK falling edge.
- 1: Signals generated by the SAI change on SCK falling edge, while signals received by the SAI are sampled on the SCK rising edge.

**Bit 8 LSBFIRST:** Least significant bit first

This bit is set and cleared by software. It must be configured when the audio block is disabled. This bit has no meaning in AC'97 audio protocol since AC'97 data are always transferred with the MSB first. This bit has no meaning in SPDIF audio protocol since in SPDIF data are always transferred with LSB first.

- 0: Data are transferred with MSB first
- 1: Data are transferred with LSB first

**Bits 7:5 DS[2:0]:** Data size

These bits are set and cleared by software. These bits are ignored when the SPDIF protocols are selected (bit PRTCFCFG[1:0]), because the frame and the data size are fixed in such case. When the companding mode is selected through COMP[1:0] bits, DS[1:0] are ignored since the data size is fixed to 8 bits by the algorithm.

These bits must be configured when the audio block is disabled.

- 000: Reserved
- 001: Reserved
- 010: 8 bits
- 011: 10 bits
- 100: 16 bits
- 101: 20 bits
- 110: 24 bits
- 111: 32 bits

Bit 4 Reserved, must be kept at reset value.

Bits 3:2 **PRTCFCG[1:0]**: Protocol configuration

These bits are set and cleared by software. These bits have to be configured when the audio block is disabled.

00: Free protocol. Free protocol enables to use the powerful configuration of the audio block to address a specific audio protocol (such as I2S, LSB/MSB justified, TDM, PCM/DSP...) by setting most of the configuration register bits as well as frame configuration register.

01: SPDIF protocol

10: AC'97 protocol

11: Reserved

Bits 1:0 **MODE[1:0]**: SAIx audio block mode

These bits are set and cleared by software. They must be configured when SAIx audio block is disabled.

00: Master transmitter

01: Master receiver

10: Slave transmitter

11: Slave receiver

*Note: When the audio block is configured in SPDIF mode, the master transmitter mode is forced (MODE[1:0] = 00). In Master transmitter mode, the audio block starts generating the FS and the clocks immediately.*

### 56.6.4 SAI configuration register 2 (SAI\_ACR2)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

COMP[1:0]		CPL	MUTE CNT[5:0]						MUTE VAL	MUTE	TRIS	F FLUSH	FTH[2:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	w	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:14 **COMP[1:0]**: Companding mode.

These bits are set and cleared by software. The  $\mu$ -Law and the A-Law log are a part of the CCITT G.711 recommendation, the type of complement that is used depends on *CPL bit*.

The data expansion or data compression are determined by the state of bit MODE[0].

The data compression is applied if the audio block is configured as a transmitter.

The data expansion is automatically applied when the audio block is configured as a receiver.

Refer to [Section : Companding mode](#) for more details.

00: No companding algorithm

01: Reserved.

10:  $\mu$ -Law algorithm

11: A-Law algorithm

*Note: Companding mode is applicable only when Free protocol mode is selected.*

Bit 13 **CPL**: Complement bit.

This bit is set and cleared by software.

It defines the type of complement to be used for companding mode

0: 1's complement representation.

1: 2's complement representation.

*Note: This bit has effect only when the companding mode is  $\mu$ -Law algorithm or A-Law algorithm.*

Bits 12:7 **MUTECNT[5:0]**: Mute counter.

These bits are set and cleared by software. They are used only in reception mode.

The value set in these bits is compared to the number of consecutive mute frames detected in reception. When the number of mute frames is equal to this value, the flag MUTEDET is set and an interrupt is generated if bit MUTEDETIE is set.

Refer to [Section : Mute mode](#) for more details.

Bit 6 **MUTEVAL**: Mute value.

This bit is set and cleared by software. It must be written before enabling the audio block: SAIEN.

This bit is meaningful only when the audio block operates as a transmitter, the number of slots is lower or equal to 2 and the MUTE bit is set.

If more slots are declared, the bit value sent during the transmission in mute mode is equal to 0, whatever the value of MUTEVAL.

if the number of slot is lower or equal to 2 and MUTEVAL = 1, the MUTE value transmitted for each slot is the one sent during the previous frame.

Refer to [Section : Mute mode](#) for more details.

0: Bit value 0 is sent during the mute mode.

1: Last values are sent during the mute mode.

*Note: This bit is meaningless and should not be used for SPDIF audio blocks.*

Bit 5 **MUTE**: Mute.

This bit is set and cleared by software. It is meaningful only when the audio block operates as a transmitter. The MUTE value is linked to value of MUTEVAL if the number of slots is lower or equal to 2, or equal to 0 if it is greater than 2.

Refer to [Section : Mute mode](#) for more details.

0: No mute mode.

1: Mute mode enabled.

*Note: This bit is meaningless and should not be used for SPDIF audio blocks.*

Bit 4 **TRIS**: Tristate management on data line.

This bit is set and cleared by software. It is meaningful only if the audio block is configured as a transmitter. This bit is not used when the audio block is configured in SPDIF mode. It should be configured when SAI is disabled.

Refer to [Section : Output data line management on an inactive slot](#) for more details.

0: SD output line is still driven by the SAI when a slot is inactive.

1: SD output line is released (HI-Z) at the end of the last data bit of the last active slot if the next one is inactive.

Bit 3 **FFLUSH**: FIFO flush.

This bit is set by software. It is always read as 0. This bit should be configured when the SAI is disabled.

0: No FIFO flush.

1: FIFO flush. Programming this bit to 1 triggers the FIFO Flush. All the internal FIFO pointers (read and write) are cleared. In this case data still present in the FIFO are lost (no more transmission or received data lost). Before flushing, SAI DMA stream/interrupt must be disabled

Bits 2:0 **FTH[2:0]**: FIFO threshold.

This bit is set and cleared by software.

000: FIFO empty

001: 1/4 FIFO

010: 1/2 FIFO

011: 3/4 FIFO

100: FIFO full

101: Reserved

110: Reserved

111: Reserved

### 56.6.5 SAI configuration register 2 (SAI\_BCR2)

### 56.6.6 SAI frame configuration register (SAI\_AFRCR)

Address offset: 0x00C

Reset value: 0x0000 0007

*Note: This register has no meaning in AC'97 and SPDIF audio protocol.*

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FSOFF	FSPOL	FSDEF
													rw	rw	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	FSALL[6:0]							FRL[7:0]							
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **FSOFF**: Frame synchronization offset.

This bit is set and cleared by software. It is meaningless and is not used in AC'97 or SPDIF audio block configuration. This bit must be configured when the audio block is disabled.

0: FS is asserted on the first bit of the slot 0.

1: FS is asserted one bit before the first bit of the slot 0.

Bit 17 **FSPOL**: Frame synchronization polarity.

This bit is set and cleared by software. It is used to configure the level of the start of frame on the FS signal. It is meaningless and is not used in AC'97 or SPDIF audio block configuration.

This bit must be configured when the audio block is disabled.

0: FS is active low (falling edge)

1: FS is active high (rising edge)

Bit 16 **FSDEF**: Frame synchronization definition.

This bit is set and cleared by software.

0: FS signal is a start frame signal

1: FS signal is a start of frame signal + channel side identification

When the bit is set, the number of slots defined in the SAI\_xSLOTR register has to be even. It means that half of this number of slots are dedicated to the left channel and the other slots for the right channel (e.g: this bit has to be set for I2S or MSB/LSB-justified protocols...).

This bit is meaningless and is not used in AC'97 or SPDIF audio block configuration. It must be configured when the audio block is disabled.

Bit 15 Reserved, must be kept at reset value.

Bits 14:8 **FSALL[6:0]**: Frame synchronization active level length.

These bits are set and cleared by software. They specify the length in number of bit clock (SCK) + 1 (FSALL[6:0] + 1) of the active level of the FS signal in the audio frame

These bits are meaningless and are not used in AC'97 or SPDIF audio block configuration.

They must be configured when the audio block is disabled.

Bits 7:0 **FRL[7:0]**: Frame length.

These bits are set and cleared by software. They define the audio frame length expressed in number of SCK clock cycles: the number of bits in the frame is equal to FRL[7:0] + 1.

The minimum number of bits to transfer in an audio frame must be equal to 8, otherwise the audio block behaves in an unexpected way. This is the case when the data size is 8 bits and only one slot 0 is defined in NBSLOT[4:0] of SAI\_xSLOTR register (NBSLOT[3:0] = 0000).

In master mode, if the master clock (available on MCLK\_x pin) is used, the frame length should be aligned with a number equal to a power of 2, ranging from 8 to 256. When the master clock is not used (NODIV = 1), it is recommended to program the frame length to an value ranging from 8 to 256.

These bits are meaningless and are not used in AC'97 or SPDIF audio block configuration. They must be configured when the audio block is disabled.

### 56.6.7 SAI frame configuration register (SAI\_BFRCR)

Address offset: 0x02C

Reset value: 0x0000 0007

*Note: This register has no meaning in AC'97 and SPDIF audio protocol*

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FSOFF	FSPOL	FSDEF
													r/w	r/w	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	FSALL[6:0]							FRL[7:0]							
	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:19 Reserved, must be kept at reset value.

**Bit 18 FSOFF:** Frame synchronization offset.

This bit is set and cleared by software. It is meaningless and is not used in AC'97 or SPDIF audio block configuration. This bit must be configured when the audio block is disabled.

0: FS is asserted on the first bit of the slot 0.

1: FS is asserted one bit before the first bit of the slot 0.

**Bit 17 FSPOL:** Frame synchronization polarity.

This bit is set and cleared by software. It is used to configure the level of the start of frame on the FS signal. It is meaningless and is not used in AC'97 or SPDIF audio block configuration.

This bit must be configured when the audio block is disabled.

0: FS is active low (falling edge)

1: FS is active high (rising edge)

**Bit 16 FSDEF:** Frame synchronization definition.

This bit is set and cleared by software.

0: FS signal is a start frame signal

1: FS signal is a start of frame signal + channel side identification

When the bit is set, the number of slots defined in the SAI\_xSLOTR register has to be even. It means that half of this number of slots is dedicated to the left channel and the other slots for the right channel (e.g: this bit has to be set for I2S or MSB/LSB-justified protocols...).

This bit is meaningless and is not used in AC'97 or SPDIF audio block configuration. It must be configured when the audio block is disabled.

Bit 15 Reserved, must be kept at reset value.

Bits 14:8 **FSALL[6:0]**: Frame synchronization active level length.

These bits are set and cleared by software. They specify the length in number of bit clock (SCK) + 1 (FSALL[6:0] + 1) of the active level of the FS signal in the audio frame  
 These bits are meaningless and are not used in AC'97 or SPDIF audio block configuration.  
 They must be configured when the audio block is disabled.

Bits 7:0 **FRL[7:0]**: Frame length.

These bits are set and cleared by software. They define the audio frame length expressed in number of SCK clock cycles: the number of bits in the frame is equal to FRL[7:0] + 1.  
 The minimum number of bits to transfer in an audio frame must be equal to 8, otherwise the audio block behaves in an unexpected way. This is the case when the data size is 8 bits and only one slot 0 is defined in NBSLOT[4:0] of SAI\_xSLOTR register (NBSLOT[3:0] = 0000).  
 In master mode, if the master clock (available on MCLK\_x pin) is used, the frame length should be aligned with a number equal to a power of 2, ranging from 8 to 256. When the master clock is not used (NODIV = 1), it is recommended to program the frame length to an value ranging from 8 to 256.  
 These bits are meaningless and are not used in AC'97 or SPDIF audio block configuration.

### 56.6.8 SAI slot register (SAI\_ASLOTR)

Address offset: 0x010

Reset value: 0x0000 0000

*Note: This register has no meaning in AC'97 and SPDIF audio protocol.*

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SLOTEN[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	NBSLOT[3:0]				SLOTSZ[1:0]		Res.	FBOFF[4:0]				
				rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw

Bits 31:16 **SLOTEN[15:0]**: Slot enable.

These bits are set and cleared by software.  
 Each SLOTEN bit corresponds to a slot position from 0 to 15 (maximum 16 slots).  
 0: Inactive slot.  
 1: Active slot.  
 The slot must be enabled when the audio block is disabled.  
 They are ignored in AC'97 or SPDIF mode.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **NBSLOT[3:0]**: Number of slots in an audio frame.

These bits are set and cleared by software.  
 The value set in this bitfield represents the number of slots + 1 in the audio frame (including the number of inactive slots). The maximum number of slots is 16.  
 The number of slots should be even if FSDEF bit in the SAI\_xFRCR register is set.  
 The number of slots must be configured when the audio block is disabled.  
 They are ignored in AC'97 or SPDIF mode.

Bits 7:6 **SLOTSZ[1:0]**: Slot size

This bits is set and cleared by software.

The slot size must be higher or equal to the data size. If this condition is not respected, the behavior of the SAI is undetermined.

Refer to [Output data line management on an inactive slot](#) for information on how to drive SD line.

These bits must be set when the audio block is disabled.

They are ignored in AC'97 or SPDIF mode.

00: The slot size is equivalent to the data size (specified in DS[3:0] in the SAI\_xCR1 register).

01: 16-bit

10: 32-bit

11: Reserved

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **FBOFF[4:0]**: First bit offset

These bits are set and cleared by software.

The value set in this bitfield defines the position of the first data transfer bit in the slot. It represents an offset value. In transmission mode, the bits outside the data field are forced to 0. In reception mode, the extra received bits are discarded.

These bits must be set when the audio block is disabled.

They are ignored in AC'97 or SPDIF mode.

### 56.6.9 SAI slot register (SAI\_BSLOTR)

Address offset: 0x030

Reset value: 0x0000 0000

*Note:* This register has no meaning in AC'97 and SPDIF audio protocol.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SLOTEN[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Res.	Res.	Res.	Res.	NBSLOT[3:0]				SLOTSZ[1:0]		Res.	FBOFF[4:0]				
				rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw

Bits 31:16 **SLOTEN[15:0]**: Slot enable.

These bits are set and cleared by software.  
 Each SLOTEN bit corresponds to a slot position from 0 to 15 (maximum 16 slots).  
 0: Inactive slot.  
 1: Active slot.  
 The slot must be enabled when the audio block is disabled.  
 They are ignored in AC'97 or SPDIF mode.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **NBSLOT[3:0]**: Number of slots in an audio frame.

These bits are set and cleared by software.  
 The value set in this bitfield represents the number of slots + 1 in the audio frame (including the number of inactive slots). The maximum number of slots is 16.  
 The number of slots should be even if FSDEF bit in the SAI\_xFRCR register is set.  
 The number of slots must be configured when the audio block is disabled.  
 They are ignored in AC'97 or SPDIF mode.

Bits 7:6 **SLOTSZ[1:0]**: Slot size

This bits is set and cleared by software.  
 The slot size must be higher or equal to the data size. If this condition is not respected, the behavior of the SAI is undetermined.  
 Refer to [Output data line management on an inactive slot](#) for information on how to drive SD line.  
 These bits must be set when the audio block is disabled.  
 They are ignored in AC'97 or SPDIF mode.  
 00: The slot size is equivalent to the data size (specified in DS[3:0] in the SAI\_xCR1 register).  
 01: 16-bit  
 10: 32-bit  
 11: Reserved

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **FBOFF[4:0]**: First bit offset

These bits are set and cleared by software.  
 The value set in this bitfield defines the position of the first data transfer bit in the slot. It represents an offset value. In transmission mode, the bits outside the data field are forced to 0. In reception mode, the extra received bits are discarded.  
 These bits must be set when the audio block is disabled.  
 They are ignored in AC'97 or SPDIF mode.

### 56.6.10 SAI interrupt mask register (SAI\_AIM)

Address offset: 0x014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LFSDET IE	AFSDETI E	CNRDY IE	FREQ IE	WCKCFG IE	MUTEDET IE	OVRUDR IE
									rw	rw	rw	rw	rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **LFSDETIE**: Late frame synchronization detection interrupt enable.

This bit is set and cleared by software.

0: Interrupt is disabled

1: Interrupt is enabled

When this bit is set, an interrupt is generated if the LFSDET bit is set in the SAI\_xSR register.

This bit is meaningless in AC'97, SPDIF mode or when the audio block operates as a master.

Bit 5 **AFSDETIE**: Anticipated frame synchronization detection interrupt enable.

This bit is set and cleared by software.

0: Interrupt is disabled

1: Interrupt is enabled

When this bit is set, an interrupt is generated if the AFSDET bit in the SAI\_xSR register is set.

This bit is meaningless in AC'97, SPDIF mode or when the audio block operates as a master.

Bit 4 **CNRDYIE**: Codec not ready interrupt enable (AC'97).

This bit is set and cleared by software.

0: Interrupt is disabled

1: Interrupt is enabled

When the interrupt is enabled, the audio block detects in the slot 0 (tag0) of the AC'97 frame if the Codec connected to this line is ready or not. If it is not ready, the CNRDY flag in the SAI\_xSR register is set and an interrupt is generated.

This bit has a meaning only if the AC'97 mode is selected through PRTCFG[1:0] bits and the audio block is operates as a receiver.

Bit 3 **FREQIE**: FIFO request interrupt enable.

This bit is set and cleared by software.

0: Interrupt is disabled

1: Interrupt is enabled

When this bit is set, an interrupt is generated if the FREQ bit in the SAI\_xSR register is set.

Since the audio block defaults to operate as a transmitter after reset, the MODE bit must be configured before setting FREQIE to avoid a parasitic interrupt in receiver mode,

Bit 2 **WCKCFGIE**: Wrong clock configuration interrupt enable.

This bit is set and cleared by software.

0: Interrupt is disabled

1: Interrupt is enabled

This bit is taken into account only if the audio block is configured as a master (MODE[1] = 0) and NODIV = 0.

It generates an interrupt if the WCKCFG flag in the SAI\_xSR register is set.

*Note: This bit is used only in Free protocol mode and is meaningless in other modes.*

Bit 1 **MUTEDETIE**: Mute detection interrupt enable.

This bit is set and cleared by software.

0: Interrupt is disabled

1: Interrupt is enabled

When this bit is set, an interrupt is generated if the MUTEDET bit in the SAI\_xSR register is set.

This bit has a meaning only if the audio block is configured in receiver mode.

Bit 0 **OVRUDRIE**: Overrun/underrun interrupt enable.

This bit is set and cleared by software.

0: Interrupt is disabled

1: Interrupt is enabled

When this bit is set, an interrupt is generated if the OVRUDR bit in the SAI\_xSR register is set.

### 56.6.11 SAI interrupt mask register (SAI\_BIM)

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LFSDET IE	AFSDETI E	CNRDY IE	FREQ IE	WCKCFG IE	MUTEDET IE	OVRUDR IE
									rw	rw	rw	rw	rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

**Bit 6 LFSDETIE:** Late frame synchronization detection interrupt enable.

This bit is set and cleared by software.

0: Interrupt is disabled

1: Interrupt is enabled

When this bit is set, an interrupt is generated if the LFSDET bit is set in the SAI\_xSR register.

This bit is meaningless in AC'97, SPDIF mode or when the audio block operates as a master.

**Bit 5 AFSDETI:** Anticipated frame synchronization detection interrupt enable.

This bit is set and cleared by software.

0: Interrupt is disabled

1: Interrupt is enabled

When this bit is set, an interrupt is generated if the AFSDET bit in the SAI\_xSR register is set.

This bit is meaningless in AC'97, SPDIF mode or when the audio block operates as a master.

**Bit 4 CNRDYIE:** Codec not ready interrupt enable (AC'97).

This bit is set and cleared by software.

0: Interrupt is disabled

1: Interrupt is enabled

When the interrupt is enabled, the audio block detects in the slot 0 (tag0) of the AC'97 frame if the Codec connected to this line is ready or not. If it is not ready, the CNRDY flag in the SAI\_xSR register is set and an interrupt is generated.

This bit has a meaning only if the AC'97 mode is selected through PRTCFG[1:0] bits and the audio block is operates as a receiver.

**Bit 3 FREQIE:** FIFO request interrupt enable.

This bit is set and cleared by software.

0: Interrupt is disabled

1: Interrupt is enabled

When this bit is set, an interrupt is generated if the FREQ bit in the SAI\_xSR register is set.

Since the audio block defaults to operate as a transmitter after reset, the MODE bit must be configured before setting FREQIE to avoid a parasitic interrupt in receiver mode,

Bit 2 **WCKCFGIE**: Wrong clock configuration interrupt enable.

This bit is set and cleared by software.

0: Interrupt is disabled

1: Interrupt is enabled

This bit is taken into account only if the audio block is configured as a master (MODE[1] = 0) and NODIV = 0.

It generates an interrupt if the WCKCFG flag in the SAI\_xSR register is set.

*Note: This bit is used only in Free protocol mode and is meaningless in other modes.*

Bit 1 **MUTEDETIE**: Mute detection interrupt enable.

This bit is set and cleared by software.

0: Interrupt is disabled

1: Interrupt is enabled

When this bit is set, an interrupt is generated if the MUTEDET bit in the SAI\_xSR register is set.

This bit has a meaning only if the audio block is configured in receiver mode.

Bit 0 **OVRUDRIE**: Overrun/underrun interrupt enable.

This bit is set and cleared by software.

0: Interrupt is disabled

1: Interrupt is enabled

When this bit is set, an interrupt is generated if the OVRUDR bit in the SAI\_xSR register is set.

### 56.6.12 SAI status register (SAI\_ASR)

Address offset: 0x018

Reset value: 0x0000 0008

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FLVL[2:0]		
													r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LFSDE T	AFSDET	CNRDY	FREQ	WCKCFG	MUTEDET	OVRUDR
									r	r	r	r	r	r	r

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:16 **FLVL[2:0]**: FIFO level threshold.

This bit is read only. The FIFO level threshold flag is managed only by hardware and its setting depends on SAI block configuration (transmitter or receiver mode).

000: FIFO empty (transmitter and receiver modes)

001:  $FIFO \leq \frac{1}{4}$  but not empty (transmitter mode),  $FIFO < \frac{1}{4}$  but not empty (receiver mode)

010:  $\frac{1}{4} < FIFO \leq \frac{1}{2}$  (transmitter mode),  $\frac{1}{4} \leq FIFO < \frac{1}{2}$  (receiver mode)

011:  $\frac{1}{2} < FIFO \leq \frac{3}{4}$  (transmitter mode),  $\frac{1}{2} \leq FIFO < \frac{3}{4}$  (receiver mode)

100:  $\frac{3}{4} < FIFO$  but not full (transmitter mode),  $\frac{3}{4} \leq FIFO$  but not full (receiver mode)

101: FIFO full (transmitter and receiver modes)

Others: Reserved

Bits 15:7 Reserved, must be kept at reset value.

Bit 6 **LFSDET**: Late frame synchronization detection.

This bit is read only.

0: No error.

1: Frame synchronization signal is not present at the right time.

This flag can be set only if the audio block is configured in slave mode.

It is not used in AC'97 or SPDIF mode.

It can generate an interrupt if LFSDETIE bit is set in the SAI\_xIM register.

This flag is cleared when the software sets bit CLFSDET in SAI\_xCLRFR register

Bit 5 **AFSDET**: Anticipated frame synchronization detection.

This bit is read only.

0: No error.

1: Frame synchronization signal is detected earlier than expected.

This flag can be set only if the audio block is configured in slave mode.

It is not used in AC'97 or SPDIF mode.

It can generate an interrupt if AFSDETIE bit is set in SAI\_xIM register.

This flag is cleared when the software sets CAFSDET bit in SAI\_xCLRFR register.

Bit 4 **CNRDY**: Codec not ready.

This bit is read only.

0: External AC'97 Codec is ready

1: External AC'97 Codec is not ready

This bit is used only when the AC'97 audio protocol is selected in the SAI\_xCR1 register and configured in receiver mode.

It can generate an interrupt if CNRDYIE bit is set in SAI\_xIM register.

This flag is cleared when the software sets CCNRDY bit in SAI\_xCLRFR register.

Bit 3 **FREQ**: FIFO request.

This bit is read only.

0: No FIFO request.

1: FIFO request to read or to write the SAI\_xDR.

The request depends on the audio block configuration:

- If the block is configured in transmission mode, the FIFO request is related to a write request operation in the SAI\_xDR.
- If the block configured in reception, the FIFO request related to a read request operation from the SAI\_xDR.

This flag can generate an interrupt if FREQIE bit is set in SAI\_xIM register.

Bit 2 **WCKCFG**: Wrong clock configuration flag.

This bit is read only.

0: Clock configuration is correct

1: Clock configuration does not respect the rule concerning the frame length specification defined in [Section 56.4.6: Frame synchronization](#) (configuration of FRL[7:0] bit in the SAI\_xFRCR register)

This bit is used only when the audio block operates in master mode (MODE[1] = 0) and NODIV = 0. It can generate an interrupt if WCKCFGIE bit is set in SAI\_xIM register.

This flag is cleared when the software sets CWCKCFG bit in SAI\_xCLRFR register.

Bit 1 **MUTEDET**: Mute detection.

This bit is read only.

0: No MUTE detection on the SD input line

1: MUTE value detected on the SD input line (0 value) for a specified number of consecutive audio frame

This flag is set if consecutive 0 values are received in each slot of a given audio frame and for a consecutive number of audio frames (set in the MUTEcnt bit in the SAI\_xCR2 register).

It can generate an interrupt if MUTEDETIE bit is set in SAI\_xIM register.

This flag is cleared when the software sets bit CMUTEDET in the SAI\_xCLRFR register.

Bit 0 **OVRUDR**: Overrun / underrun.

This bit is read only.

0: No overrun/underrun error.

1: Overrun/underrun error detection.

The overrun and underrun conditions can occur only when the audio block is configured as a receiver and a transmitter, respectively.

It can generate an interrupt if OVRUDRIE bit is set in SAI\_xIM register.

This flag is cleared when the software sets COVRUDR bit in SAI\_xCLRFR register.

### 56.6.13 SAI status register (SAI\_BSR)

Address offset: 0x038

Reset value: 0x0000 0008

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FLVL[2:0]		
													r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LFSDE T	AFSDET	CNRDY	FREQ	WCKCFG	MUTEDET	OVRUDR
									r	r	r	r	r	r	r

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:16 **FLVL[2:0]**: FIFO level threshold.

This bit is read only. The FIFO level threshold flag is managed only by hardware and its setting depends on SAI block configuration (transmitter or receiver mode).

000: FIFO empty (transmitter and receiver modes)

001:  $FIFO \leq \frac{1}{4}$  but not empty (transmitter mode),  $FIFO < \frac{1}{4}$  but not empty (receiver mode)

010:  $\frac{1}{4} < FIFO \leq \frac{1}{2}$  (transmitter mode),  $\frac{1}{4} \leq FIFO < \frac{1}{2}$  (receiver mode)

011:  $\frac{1}{2} < FIFO \leq \frac{3}{4}$  (transmitter mode),  $\frac{1}{2} \leq FIFO < \frac{3}{4}$  (receiver mode)

100:  $\frac{3}{4} < FIFO$  but not full (transmitter mode),  $\frac{3}{4} \leq FIFO$  but not full (receiver mode)

101: FIFO full (transmitter and receiver modes)

Others: Reserved

Bits 15:7 Reserved, must be kept at reset value.

Bit 6 **LFSDET**: Late frame synchronization detection.

This bit is read only.

0: No error.

1: Frame synchronization signal is not present at the right time.

This flag can be set only if the audio block is configured in slave mode.

It is not used in AC'97 or SPDIF mode.

It can generate an interrupt if LFSDETIE bit is set in the SAI\_xIM register.

This flag is cleared when the software sets bit CLFSDET in SAI\_xCLRFR register

Bit 5 **AFSDET**: Anticipated frame synchronization detection.

This bit is read only.

0: No error.

1: Frame synchronization signal is detected earlier than expected.

This flag can be set only if the audio block is configured in slave mode.

It is not used in AC'97 or SPDIF mode.

It can generate an interrupt if AFSDETIE bit is set in SAI\_xIM register.

This flag is cleared when the software sets CAFSDET bit in SAI\_xCLRFR register.

Bit 4 **CNRDY**: Codec not ready.

This bit is read only.

0: External AC'97 Codec is ready

1: External AC'97 Codec is not ready

This bit is used only when the AC'97 audio protocol is selected in the SAI\_xCR1 register and configured in receiver mode.

It can generate an interrupt if CNRDYIE bit is set in SAI\_xIM register.

This flag is cleared when the software sets CCNRDY bit in SAI\_xCLRFR register.

Bit 3 **FREQ**: FIFO request.

This bit is read only.

0: No FIFO request.

1: FIFO request to read or to write the SAI\_xDR.

The request depends on the audio block configuration:

- If the block is configured in transmission mode, the FIFO request is related to a write request operation in the SAI\_xDR.

- If the block configured in reception, the FIFO request related to a read request operation from the SAI\_xDR.

This flag can generate an interrupt if FREQIE bit is set in SAI\_xIM register.

Bit 2 **WCKCFG**: Wrong clock configuration flag.

This bit is read only.

0: Clock configuration is correct

1: Clock configuration does not respect the rule concerning the frame length specification defined in [Section 56.4.6: Frame synchronization](#) (configuration of FRL[7:0] bit in the SAI\_xFRCR register)

This bit is used only when the audio block operates in master mode (MODE[1] = 0) and NODIV = 0. It can generate an interrupt if WCKCFGIE bit is set in SAI\_xIM register.

This flag is cleared when the software sets CWCKCFG bit in SAI\_xCLRFR register.

Bit 1 **MUTEDET**: Mute detection.

This bit is read only.

0: No MUTE detection on the SD input line

1: MUTE value detected on the SD input line (0 value) for a specified number of consecutive audio frame

This flag is set if consecutive 0 values are received in each slot of a given audio frame and for a consecutive number of audio frames (set in the MUTEcnt bit in the SAI\_xCR2 register).

It can generate an interrupt if MUTEDETIE bit is set in SAI\_xIM register.

This flag is cleared when the software sets bit CMUTEDET in the SAI\_xCLRFR register.

Bit 0 **OVRUDR**: Overrun / underrun.

This bit is read only.

0: No overrun/underrun error.

1: Overrun/underrun error detection.

The overrun and underrun conditions can occur only when the audio block is configured as a receiver and a transmitter, respectively.

It can generate an interrupt if OVRUDRIE bit is set in SAI\_xIM register.

This flag is cleared when the software sets COVRUDR bit in SAI\_xCLRFR register.

### 56.6.14 SAI clear flag register (SAI\_ACLRFR)

Address offset: 0x01C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLFSDET	CAFSDET	CCNRDY	Res.	CWCKCFG	CMUTEDET	COVRUDR
									w	w	w		w	w	w

Bits 31:7 Reserved, must be kept at reset value.

- Bit 6 **CLFSDET**: Clear late frame synchronization detection flag.  
 This bit is write only.  
 Programming this bit to 1 clears the LFSDET flag in the SAI\_xSR register.  
 This bit is not used in AC'97 or SPDIF mode  
 Reading this bit always returns the value 0.
- Bit 5 **CAFSDDET**: Clear anticipated frame synchronization detection flag.  
 This bit is write only.  
 Programming this bit to 1 clears the AFSDET flag in the SAI\_xSR register.  
 It is not used in AC'97 or SPDIF mode.  
 Reading this bit always returns the value 0.
- Bit 4 **CCNRDY**: Clear Codec not ready flag.  
 This bit is write only.  
 Programming this bit to 1 clears the CNRDY flag in the SAI\_xSR register.  
 This bit is used only when the AC'97 audio protocol is selected in the SAI\_xCR1 register.  
 Reading this bit always returns the value 0.
- Bit 3 Reserved, must be kept at reset value.
- Bit 2 **CWCKCFG**: Clear wrong clock configuration flag.  
 This bit is write only.  
 Programming this bit to 1 clears the WCKCFG flag in the SAI\_xSR register.  
 This bit is used only when the audio block is set as master (MODE[1] = 0) and NODIV = 0 in the SAI\_xCR1 register.  
 Reading this bit always returns the value 0.
- Bit 1 **CMUTEDET**: Mute detection flag.  
 This bit is write only.  
 Programming this bit to 1 clears the MUTEDET flag in the SAI\_xSR register.  
 Reading this bit always returns the value 0.
- Bit 0 **COVRUDR**: Clear overrun / underrun.  
 This bit is write only.  
 Programming this bit to 1 clears the OVRUDR flag in the SAI\_xSR register.  
 Reading this bit always returns the value 0.

### 56.6.15 SAI clear flag register (SAI\_BCLRFR)

Address offset: 0x03C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLFSDET	CAFSDDET	CCNRDY	Res.	CWCKCF G	CMUTE DET	COVRUD R
									w	w	w		w	w	w

Bits 31:7 Reserved, must be kept at reset value.

- Bit 6 **CLFSDET**: Clear late frame synchronization detection flag.  
 This bit is write only.  
 Programming this bit to 1 clears the LFSDET flag in the SAI\_xSR register.  
 This bit is not used in AC'97 or SPDIF mode.  
 Reading this bit always returns the value 0.
- Bit 5 **CAFSDDET**: Clear anticipated frame synchronization detection flag.  
 This bit is write only.  
 Programming this bit to 1 clears the AFSDET flag in the SAI\_xSR register.  
 It is not used in AC'97 or SPDIF mode.  
 Reading this bit always returns the value 0.
- Bit 4 **CCNRDY**: Clear Codec not ready flag.  
 This bit is write only.  
 Programming this bit to 1 clears the CNRDY flag in the SAI\_xSR register.  
 This bit is used only when the AC'97 audio protocol is selected in the SAI\_xCR1 register.  
 Reading this bit always returns the value 0.
- Bit 3 Reserved, must be kept at reset value.
- Bit 2 **WCKCFG**: Clear wrong clock configuration flag.  
 This bit is write only.  
 Programming this bit to 1 clears the WCKCFG flag in the SAI\_xSR register.  
 This bit is used only when the audio block is set as master (MODE[1] = 0) and NODIV = 0 in the SAI\_xCR1 register.  
 Reading this bit always returns the value 0.
- Bit 1 **CMUTEDET**: Mute detection flag.  
 This bit is write only.  
 Programming this bit to 1 clears the MUTEDET flag in the SAI\_xSR register.  
 Reading this bit always returns the value 0.
- Bit 0 **COVRUDR**: Clear overrun / underrun.  
 This bit is write only.  
 Programming this bit to 1 clears the OVRUDR flag in the SAI\_xSR register.  
 Reading this bit always returns the value 0.

### 56.6.16 SAI data register (SAI\_ADR)

Address offset: 0x020

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DATA[31:0]**: Data

A write to this register loads the FIFO provided the FIFO is not full.  
 A read from this register empties the FIFO if the FIFO is not empty.

### 56.6.17 SAI data register (SAI\_BDR)

Address offset: 0x040

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATA[31:16]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATA[15:0]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

Bits 31:0 **DATA[31:0]**: Data

A write to this register loads the FIFO provided the FIFO is not full.  
 A read from this register empties the FIFO if the FIFO is not empty.

### 56.6.18 SAI PDM control register (SAI\_PDMCR)

Address offset: 0x0044

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CKEN4	CKEN3	CKEN2	CKEN1	Res.	Res.	MICNBR[1:0]		Res.	Res.	Res.	PDMEN
				rW	rW	rW	rW			rW	rW				rW

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **CKEN4**: Clock enable of bitstream clock number 4

This bit is set and cleared by software.

0: SAI\_CK4 clock disabled

1: SAI\_CK4 clock enabled

*Note:* It is not recommended to configure this bit when PDMEN = 1.

*SAI\_CK4 might not be available for all SAI instances. Refer to [Section 56.3: SAI implementation](#) for details.*

Bit 10 **CKEN3**: Clock enable of bitstream clock number 3

This bit is set and cleared by software.

0: SAI\_CK3 clock disabled

1: SAI\_CK3 clock enabled

*Note: It is not recommended to configure this bit when PDMEN = 1.*

*SAI\_CK3 might not be available for all SAI instances. Refer to [Section 56.3: SAI implementation](#) for details.*

Bit 9 **CKEN2**: Clock enable of bitstream clock number 2

This bit is set and cleared by software.

0: SAI\_CK2 clock disabled

1: SAI\_CK2 clock enabled

*Note: It is not recommended to configure this bit when PDMEN = 1.*

*SAI\_CK2 might not be available for all SAI instances. Refer to [Section 56.3: SAI implementation](#) for details.*

Bit 8 **CKEN1**: Clock enable of bitstream clock number 1

This bit is set and cleared by software.

0: SAI\_CK1 clock disabled

1: SAI\_CK1 clock enabled

*Note: It is not recommended to configure this bit when PDMEN = 1.*

*SAI\_CK1 might not be available for all SAI instances. Refer to [Section 56.3: SAI implementation](#) for details.*

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **MICNBR[1:0]**: Number of microphones

This bit is set and cleared by software.

00: Configuration with 2 microphones

01: Configuration with 4 microphones

10: Configuration with 6 microphones

11: Configuration with 8 microphones

*Note: It is not recommended to configure this field when PDMEN = 1.\**

*The complete set of data lines might not be available for all SAI instances. Refer to [Section 56.3: SAI implementation](#) for details.*

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **PDMEN**: PDM enable

This bit is set and cleared by software. This bit enables to control the state of the PDM interface block.

Make sure that the SAI is already operating in TDM master mode before enabling the PDM interface.

0: PDM interface disabled

1: PDM interface enabled

**56.6.19 SAI PDM delay register (SAI\_PDMDLY)**

Address offset: 0x0048

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **DLYM4R[2:0]**: Delay line for second microphone of pair 4

This bit is set and cleared by software.

000: No delay

001: Delay of 1 T<sub>SAI\_CK</sub> period

010: Delay of 2 T<sub>SAI\_CK</sub> periods

...

111: Delay of 7 T<sub>SAI\_CK</sub> periods

This field can be changed on-the-fly.

*Note: This field can be used only if D4 line is available. Refer to Section 56.3: SAI implementation to check if it is available.*

Bit 27 Reserved, must be kept at reset value.

Bits 26:24 **DLYM4L[2:0]**: Delay line for first microphone of pair 4

This bit is set and cleared by software.

000: No delay

001: Delay of 1 T<sub>SAI\_CK</sub> period

010: Delay of 2 T<sub>SAI\_CK</sub> periods

...

111: Delay of 7 of T<sub>SAI\_CK</sub> periods

This field can be changed on-the-fly.

*Note: This field can be used only if D4 line is available. Refer to Section 56.3: SAI implementation to check if it is available.*

Bit 23 Reserved, must be kept at reset value.

Bits 22:20 **DLYM3R[2:0]**: Delay line for second microphone of pair 3

This bit is set and cleared by software.

000: No delay

001: Delay of 1  $T_{SAI\_CK}$  period

010: Delay of 2  $T_{SAI\_CK}$  periods

...

111: Delay of 7  $T_{SAI\_CK}$  periods

This field can be changed on-the-fly.

*Note: This field can be used only if D3 line is available. Refer to [Section 56.3: SAI implementation](#) to check if it is available.*

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **DLYM3L[2:0]**: Delay line for first microphone of pair 3

This bit is set and cleared by software.

000: No delay

001: Delay of 1  $T_{SAI\_CK}$  period

010: Delay of 2  $T_{SAI\_CK}$  periods

...

111: Delay of 7  $T_{SAI\_CK}$  periods

This field can be changed on-the-fly.

*Note: This field can be used only if D3 line is available. Refer to [Section 56.3: SAI implementation](#) to check if it is available.*

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **DLYM2R[2:0]**: Delay line for second microphone of pair 2

This bit is set and cleared by software.

000: No delay

001: Delay of 1  $T_{SAI\_CK}$  period

010: Delay of 2  $T_{SAI\_CK}$  periods

...

111: Delay of 7  $T_{SAI\_CK}$  periods

This field can be changed on-the-fly.

*Note: This field can be used only if D2 line is available. Refer to [Section 56.3: SAI implementation](#) to check if it is available.*

Bit 11 Reserved, must be kept at reset value.

Bits 10:8 **DLYM2L[2:0]**: Delay line for first microphone of pair 2

This bit is set and cleared by software.

000: No delay

001: Delay of 1  $T_{SAI\_CK}$  period

010: Delay of 2  $T_{SAI\_CK}$  periods

...

111: Delay of 7  $T_{SAI\_CK}$  periods

This field can be changed on-the-fly.

*Note: This field can be used only if D2 line is available. Refer to [Section 56.3: SAI implementation](#) to check if it is available.*

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **DLYM1R[2:0]**: Delay line adjust for second microphone of pair 1

This bit is set and cleared by software.

- 000: No delay

## 57 SPDIF receiver interface (SPDIFRX)

### 57.1 SPDIFRX interface introduction

The SPDIFRX interface handles S/PDIF audio protocol.

### 57.2 SPDIFRX main features

- Up to 4 inputs available
- Automatic symbol rate detection
- Maximum symbol rate: 12.288 MHz
- Stereo stream from 8 to 192 kHz<sup>(a)</sup> supported
- Supports audio IEC-60958 and IEC-61937, consumer applications
- Parity bit management
- Communication using DMA for audio samples
- Communication using DMA for control and user channel information
- Interrupt capabilities

### 57.3 SPDIFRX functional description

The SPDIFRX peripheral, is designed to receive an S/PDIF flow compliant with IEC-60958 and IEC-61937. These standards support simple stereo streams up to high sample rate, and compressed multi-channel surround sound, such as those defined by Dolby or DTS.

The receiver provides all the necessary features to detect the symbol rate, and decode the incoming data. It is possible to use a dedicated path for the user and channel information in order to ease the interface handling. [Figure 638](#) shows a simplified block diagram.

The SPDIFRX\_DC block is responsible of the decoding of the S/PDIF stream received from SPDIFRX\_IN[4:1] inputs. This block re-sample the incoming signal, decode the manchester stream, recognize frames, sub-frames and blocks elements. It delivers to the REG\_IF part, decoded data, and associated status flags.

This peripheral can be fully controlled via the APB bus, and can handle two DMA channels:

- A DMA channel dedicated to the transfer of audio samples
- A DMA channel dedicated to the transfer of IEC60958 channel status and user information

Interrupt services are also available either as an alternative function to the DMA, or for signaling error or key status of the peripheral.

The SPDIFRX also offers a signal named `spdifrx_frame_sync`, which toggles every time that a sub-frame's preamble is detected. So the duty cycle is 50%, and the frequency equal to the frame rate.

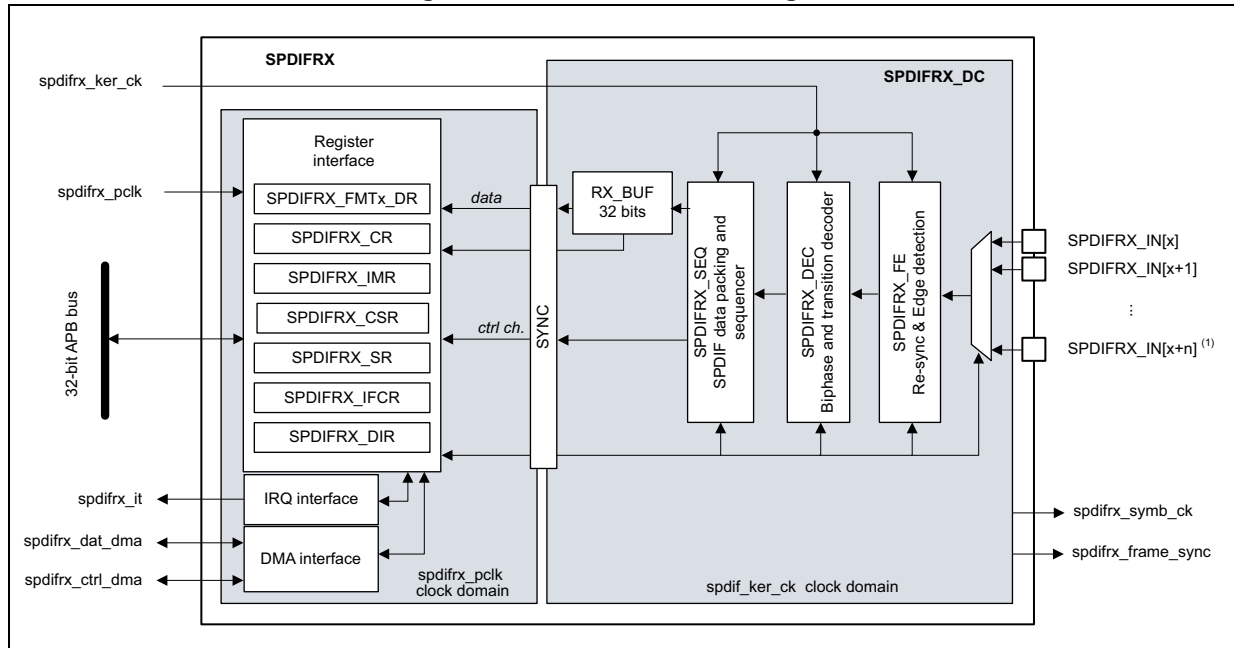

This signal can be connected to timer events, in order to compute frequency drift.

---

a. Check the RCC capabilities in order to verify which sampling rates can be supported.

In addition the SPDIFRX also provides a signal named **spdifrx\_symb\_ck** toggling at the symbol rate.

Figure 638. SPDIFRX block diagram

1. 'n' is fixed to 4, and 'x' is set to 1.

### 57.3.1 SPDIFRX pins and internal signals

Table 423 lists the SPDIFRX internal input/output signals, Table 424 the SPDIFRX pins (alternate functions).

Table 423. SPDIFRX internal input/output signals

Signal name	Signal type	Description
spdifrx_ker_ck	Digital input	SPDIFRX kernel clock
spdifrx_pclk	Digital input	SPDIFRX register interface clock
spdifrx_it	Digital output	SPDIFRX global interrupt
spdifrx_dat_dma	Digital input/output	SPDIFRX DMA request (and acknowledge) for data transfer
spdifrx_ctrl_dma	Digital input/output	SPDIFRX DMA request (and acknowledge) for channel status and user information transfer
spdifrx_frame_sync	Digital output	SPDIFRX frame rate synchronization signal
spdifrx_symb_ck	Digital output	SPDIFRX channel symbol clock

Table 424. SPDIFRX pins

Signal name	Signal type	Description
SPDIFRX_IN1	Digital input	Input 1 for S/PDIF signal
SPDIFRX_IN2	Digital input	Input 2 for S/PDIF signal

Table 424. SPDIFRX pins (continued)

Signal name	Signal type	Description
SPDIFRX_IN3	Digital input	Input 3 for S/PDIF signal
SPDIFRX_IN4	Digital input	Input 4 for S/PDIF signal

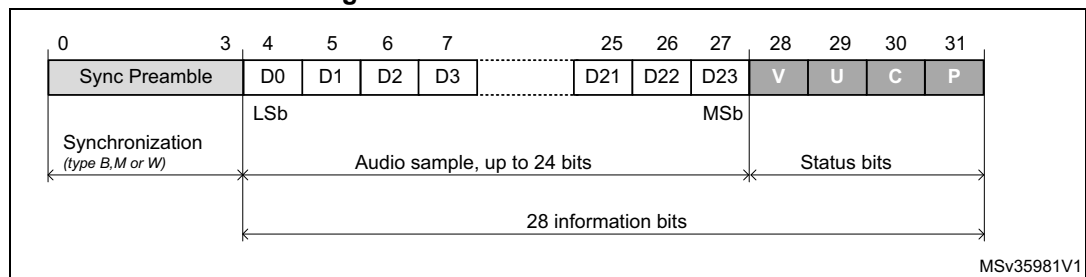

### 57.3.2 S/PDIF protocol (IEC-60958)

#### S/PDIF block

A S/PDIF frame is composed of two sub-frames (see [Figure 639](#)). Each sub-frame contains 32 bits (or time slots):

- Bits 0 to 3 carry one of the synchronization preambles
- Bits 4 to 27 carry the audio sample word in linear 2's complement representation. The most significant bit (MSB) is carried by bit 27. When a 20-bit coding range is used, bits 8 to 27 carry the audio sample word with the LSB in bit 8.
- Bit 28 (validity bit “V”) indicates if the data is valid (for converting it to analog for example)
- Bit 29 (user data bit “U”) carries the user data information like the number of tracks of a Compact Disk.
- Bit 30 (channel status bit “C”) carries the channel status information like sample rate and protection against copy.
- Bit 31 (parity bit “P”) carries a parity bit such that bits 4 to 31 inclusive carry an even number of ones and an even number of zeroes (even parity).

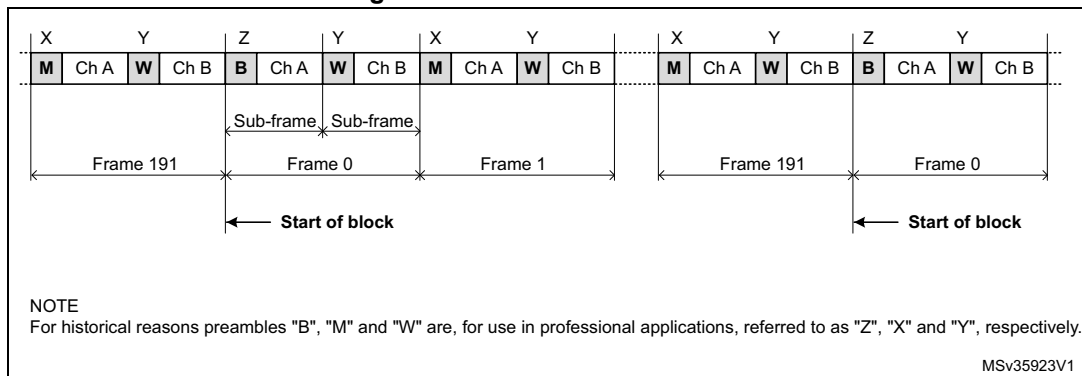

Figure 639. S/PDIF sub-frame format

For linear coded audio applications, the first sub-frame (left or “A” channel in stereophonic operation and primary channel in monophonic operation) normally starts with preamble “M”. However, the preamble changes to preamble “B” once every 192 frames to identify the start of the block structure used to organize the channel status and user information. The second sub-frame (right or “B” channel in stereophonic operation and secondary channel in monophonic operation) always starts with preamble “W”.

A S/PDIF block contains 192 pairs of sub-frames of 32 bits.

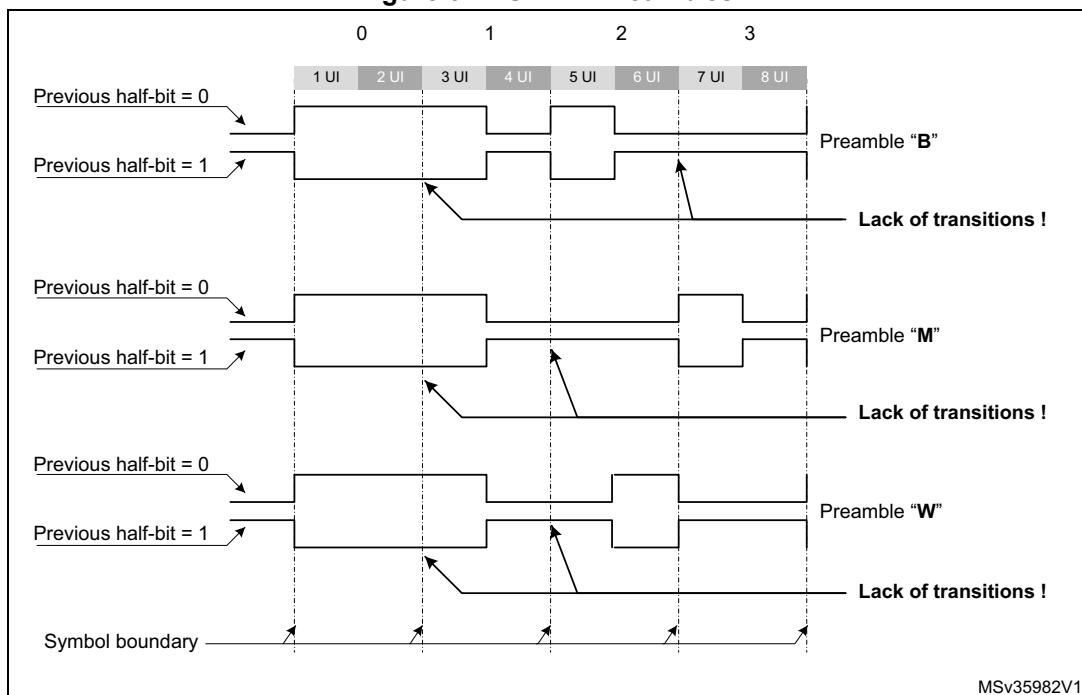

Figure 640. S/PDIF block format

Synchronization preambles

The preambles patterns are inverted or not according to the previous half-bit value. This previous half-bit value is the level of the line before enabling a transfer for the first "B" preamble of the first frame. For the others preambles, this previous half-bit value is the second half-bit of the parity bit of the previous sub-frame. The preambles patterns B, M and W are described in the [Figure 641](#).

Figure 641. S/PDIF Preambles

Coding of information bits

In order to minimize the DC component value on the transmission line, and to facilitate clock recovery from the data stream, bits 4 to 31 are encoded in biphase-mark.

Each bit to be transmitted is represented by a symbol comprising two consecutive binary states. The first state of a symbol is always different from the second state of the previous symbol. The second state of the symbol is identical to the first if the bit to be transmitted is

logical 0. However, it is different if the bit is logical 1. These states are named “UI” (unit interval) in the IEC-60958 specification.

The 24 data bits are transferred LSB first.

**Figure 642. Channel coding example**

### 57.3.3 SPDIFRX decoder (SPDIFRX\_DC)

#### Main principle

The technique used by the SPDIFRX in order to decode the S/PDIF stream is based on the measurement of the time interval between two consecutive edges. Three kinds of time intervals may be found into an S/PDIF stream:

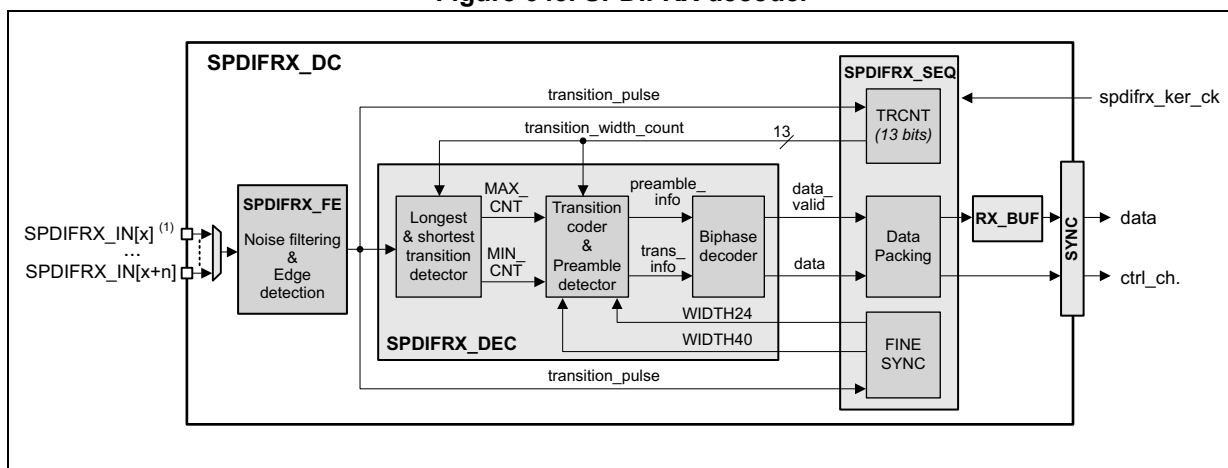

- The long time interval, having a duration of 3 x UI, noted TL. It appears only during preambles.
- The medium time interval, having a duration of 2 x UI, noted TM. It appears both in some preambles or into the information field.
- The short time interval, having a duration of 1 x UI, noted TS. It appears both in some preambles or into the information field.

The SPDIFRX\_DC block is responsible of the decoding of the received S/PDIF stream. It takes care of the following functions:

- Resampling and filtering of the incoming signal
- Estimation of the time-intervals
- Estimation of the symbol rate and synchronization
- Decoding of the serial data, and check of integrity
- Detection of the block, and sub-frame preambles
- Continuous tracking of the symbol rate

Figure 643 gives a detailed view of the SPDIFRX decoder.

Figure 643. SPDIFRX decoder

1. 'n' is fixed to 4, and 'x' is set to 1.

### Noise filtering and rising/falling edge detection

The S/PDIF signal received on the selected SPDIFRX\_IN is re-sampled using the spdifrx\_ker\_ck clock (acquisition clock). A simple filtering is applied in order cancel spurs. This is performed by the stage detecting the edge transitions. The edge transitions are detected as follow:

- A rising edge is detected when the sequence 0 followed by two 1 is sampled.
- A falling edge is detected when the sequence 1 followed by two 0 is sampled.
- After a rising edge, a falling edge sequence is expected.
- After a falling edge, a rising edge sequence is expected.

Figure 644. Noise filtering and edge detection

### Longest and shortest transition detector

The **longest and shortest transition detector** block detects the maximum (MAX\_CNT) and minimum (MIN\_CNT) duration between two transitions. The TRCNT counter is used to measure the time interval duration. It is clocked by the spdifrx\_ker\_ck signal. On every transition pulse, the counter value is stored and the counter is reset to start counting again.

The maximum duration is normally found during the preamble period. This maximum duration is sent out as MAX\_CNT. The minimum duration is sent out as MIN\_CNT.

The search of the longest and shortest transition is stopped when the transition timer expires. The transition timer is like a watchdog timer that generates a trigger after 70 transitions of the incoming signal. Note that counting 70 transitions insures a delay a bit longer than a sub-frame.

Note that when the TRCNT overflows due to a too long time interval between two pulses, the SPDIFRX is stopped and the flag TERR of SPDIFRX\_SR register is set to 1.

### Transition coder and preamble detector

The **transition coder and preamble detector** block receives the MAX\_CNT and MIN\_CNT. It also receives the current transition width from the TRCNT counter (see [Figure 643](#)). This block encodes the current transition width by comparing the current transition width with two different thresholds, names TH<sub>HI</sub> and TH<sub>LO</sub>.

- If the current transition width is less than (TH<sub>LO</sub> - 1), then the data received is half part of data bit '1', and is coded as TS.
- If the current transition width is greater than (TH<sub>LO</sub> - 1), and less than TH<sub>HI</sub>, then the data received is data bit '0', and is coded as TM.
- If the current transition width is greater than TH<sub>HI</sub>, then the data received is the long pulse of preambles, and is coded as TL.
- Else an error code is generated (FERR flag is set).

The thresholds TH<sub>HI</sub> and TH<sub>LO</sub> are elaborated using two different methods.

If the peripheral is doing its initial synchronization ('coarse synchronization'), then the thresholds are computed as follow:

- TH<sub>LO</sub> = MAX\_CNT / 2.
- TH<sub>HI</sub> = MIN\_CNT + MAX\_CNT / 2.

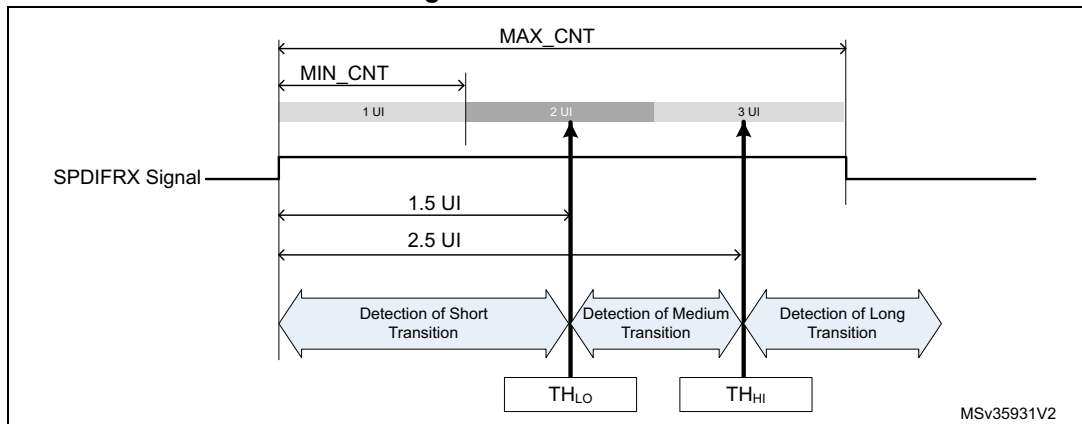

Once the 'coarse synchronization' is completed, then the SPDIFRX uses a more accurate reference in order to elaborate the thresholds. The SPDIFRX measures the length of 24 symbols (WIDTH24) for defining TH<sub>LO</sub> and the length of 40 symbols (WIDTH40) for TH<sub>HI</sub>. TH<sub>HI</sub> and TH<sub>LO</sub> are computed as follow:

- TH<sub>LO</sub> = (WIDTH24) / 32
- TH<sub>HI</sub> = (WIDTH40) / 32

This second synchronization phase is called the 'fine synchronization'. Refer to [Figure 647](#) for additional information.

As shown in the figure hereafter, TH<sub>Lo</sub> is ideally equal to 1.5 UI, and to TH<sub>Hi</sub> 2.5 UI.

**Figure 645. Thresholds**

The preamble detector checks four consecutive transitions of a specific sequence to determine if they form the part of preamble. Let us say TRANS0, TRANS1, TRANS2 and TRANS3 represent four consecutive transitions encoded as mentioned above. [Table 425](#) shows the values of these four transitions to form a preamble. Absence of this pattern indicates that these transitions form part of the data in the sub frame and bi-phase decoder decode them.

**Table 425. Transition sequence for preamble**

Preamble type	Biphase data pattern	TRANS3	TRANS2	TRANS1	TRANS0
Preamble B	11101000	TL	TS	TS	TL
Preamble M	11100010	TL	TL	TS	TS
Preamble W	11100100	TL	TM	TS	TM

### Bi-phase decoder

The Bi-phase decoder decodes the input bi-phase marked data stream using the transition information provided by the **transition coder and preamble detector** block. It first waits for the preamble detection information. After the preamble detection, it decodes the following transition information:

- If the incoming transition information is TM then it is decoded as a '0'.
- Two consecutive TS are decoded as a '1'.
- Any other transition sequence generates an error signal (FERR set to 1).

After decoding 28 data bits this way, this module looks for the following preamble data. If the new preamble is not what is expected, then this block generates an error signal (FERR set to 1). Refer to [Section 57.3.9: Reception errors](#), for additional information on error flags.

### Data packing

This block is responsible of the decoding of the IEC-60958 frames and blocks. It also handles the writing into the RX\_BUF or into SPDIFRX\_CSR register.

### 57.3.4 SPDIFRX tolerance to clock deviation

The SPDIFRX tolerance to clock deviation depends on the number of sample clock cycles in one bit slot. The fastest `spdifrx_ker_ck` is, the more robust the reception is. The ratio between `spdifrx_ker_ck` frequency and the symbol rate must be at least 11.

Two kinds of phenomenon (at least) can degrade the reception quality:

- The cycle-to-cycle jitter which reflects the difference of transition length between two consecutive transitions.
- The long term jitter which reflects a cumulative effect of the cycle-to-cycle jitter. It can be seen as a low-frequency symbol modulation.

### 57.3.5 SPDIFRX synchronization

The synchronization phase starts when setting `SPDIFRXEN` to 01 or 11. [Figure 646](#) shows the synchronization process.

If the bit `WFA` of `SPDIFRX_CR` register is set to 1, then the peripheral must first detect activity on the selected `SPDIFRX_IN` line before starting the synchronization process. The activity detection is performed by detecting four transitions on the selected `SPDIFRX_IN`. The peripheral remains in this state until transitions are not detected. This function can be particularly helpful because the SPDIFRX switches in COARSE SYNC mode only if activity is present on the selected `SPDIFRX_IN` input, avoiding synchronization errors. See [Section 57.4: Programming procedures](#) for additional information.

The user can still set the SPDIFRX into `STATE_IDLE` by setting `SPDIFRXEN` to 0. If the `WFA` is set to 0, the peripheral starts the coarse synchronization without checking activity.

The next step consists on doing a first estimate of the thresholds (COARSE SYNC), in order to perform the fine synchronization (FINE SYNC). Due to disturbances of the SPDIFRX line, it can happen that the process is not executed first time right. For this purpose, the user can program the number of allowed re-tries (`NBTR`) before setting `SERR` error flag.

When the SPDIFRX is able to measure properly the duration of 24 and 40 consecutive symbols then the FINE SYNC is completed, the threshold values are updated, and the flag `SYNCD` is set to 1. Refer to [Section : Transition coder and preamble detector](#) for additional information.

Two kinds of errors are detected:

- An overflow of the `TRCNT`, which generally means that there is no valid S/PDIF stream in the input line. This overflow is indicated by `TERR` flag.
- The number of retries reached the programmed value. This means that strong jitter is present on the S/PDIF signal. This error is indicated by `SERR` flag.

When the first FINE SYNC is completed, the reception of channel status (C) and user data (U) starts when the next "B" preamble is detected (see [Figure 650](#)). Then the user can read IEC-60958 C and U bits through `SPDIFRX_CSR` register. According to this information the user can then select the proper settings for `DRFMT` and `RXSTEO`. For example if the user detects that the current audio stream transports encoded data, then he can put `RXSTEO` to 0, and `DRFMT` to 10 prior to start data reception. Note that `DRFMT` and `RXSTEO` cannot be modified when `SPDIFRXEN` = 11. Writes to these fields are ignored if `SPDIFRXEN` is already 11, though these field can be changed with the same write instruction that causes `SPDIFRXEN` to become 11.

Then the SPDIFRX waits for `SPDIFRXEN` = 11 and the "B" preamble before starting saving audio samples.

Figure 646. Synchronization flowchart

Refer to [Frame structure and synchronization error](#) for additional information concerning TRCNT overflow.

The FINE SYNC process is re-triggered every frame in order to update thresholds as shown in [Figure 647](#) in order to continuously track S/PDIF synchronization.

Figure 647. Synchronization process scheduling

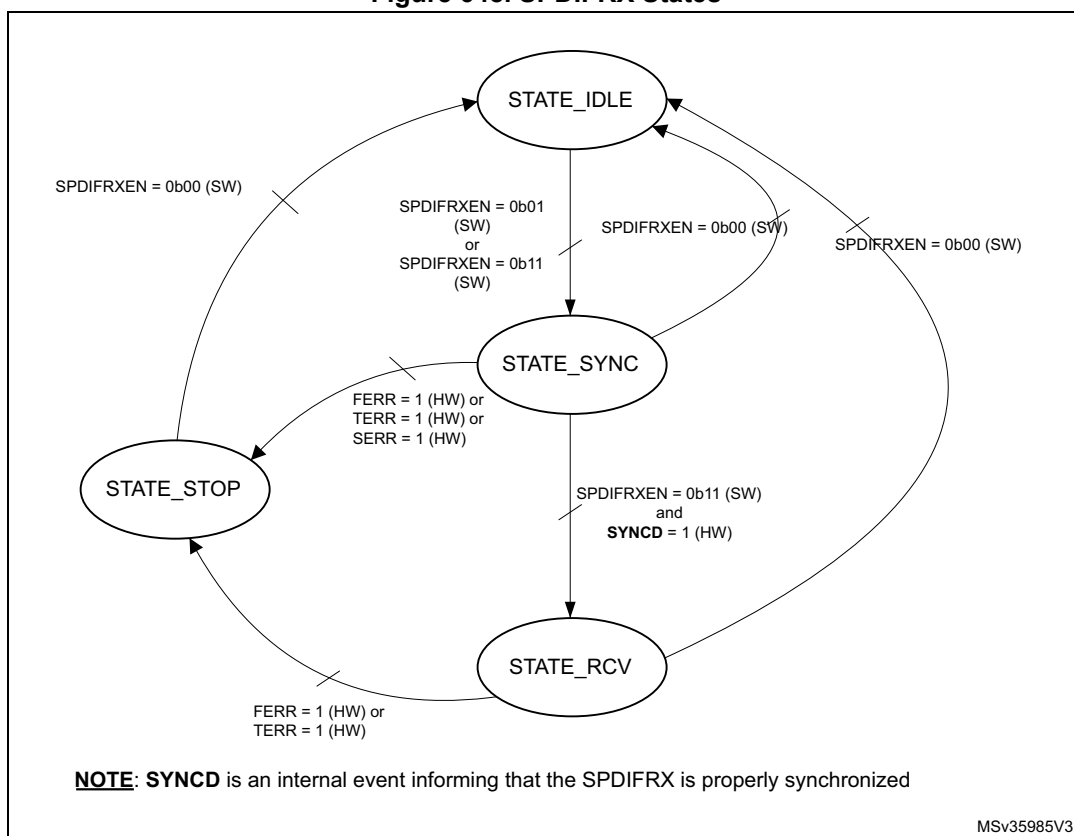

### 57.3.6 SPDIFRX handling

The software can control the state of the SPDIFRX through SPDIFRXEN field. The SPDIFRX can be into one of the following states:

- **STATE\_IDLE:**  
The peripheral is disabled, the spdifrx\_ker\_ck domain is reset. The spdifrx\_pclk domain is functional.
- **STATE\_SYNC:**  
The peripheral is synchronized to the stream, thresholds are updated regularly, user and channel status can be read via interrupt of DMA. The audio samples are not provided to receive buffer.
- **STATE\_RCV:**  
The peripheral is synchronized to the stream, thresholds are updated regularly, user, channel status and audio samples can be read via interrupt or DMA channels. When SPDIFRXEN goes to 11, the SPDIFRX waits for “B” preamble before starting saving audio samples.
- **STOP\_STATE:**  
The peripheral is no longer synchronized, the reception of the user, channel status and audio samples are stopped. It is expected that the software re-starts the SPDIFRX.

Figure 648 shows the possible states of the SPDIFRX, and how to transition from one state to the other. The bits under software control are followed by the mention “(SW)”, the bits under SPDIFRX control are followed by the mention “(HW)”.

Figure 648. SPDIFRX States

When SPDIFRX is in STATE\_IDLE:

- The software can transition to STATE\_SYNC by setting SPDIFRXEN to 01 or 11

When SPDIFRX is in STATE\_SYNC:

- If the synchronization fails or if the received data are not properly decoded with no chance of recovery without a re-synchronization (FERR or SERR or TERR = 1), the SPDIFRX goes to STATE\_STOP, and waits for software acknowledge.
- When the synchronization phase is completed, if SPDIFRXEN = 01 the peripheral remains in this state.
- At any time the software can set SPDIFRXEN to 0, then SPDIFRX returns immediately to STATE\_IDLE. If a DMA transfer is on-going, it is properly completed.
- The SPDIFRX goes to STATE\_RCV if SPDIFRXEN = 11 and if the SYNCDC = 1

When SPDIFRX is in STATE\_RCV:

- If the received data are not properly decoded with no chance of recovery without a re-synchronization (FERR or SERR or TERR = 1), the SPDIFRX goes to STATE\_STOP, and waits for software acknowledge.
- At any time the software can set SPDIFRXEN to 0, then SPDIFRX returns immediately to STATE\_IDLE. If a DMA transfer is on-going, it is properly completed.

When SPDIFRX is in STATE\_STOP:

- The SPDIFRX stops reception and synchronization, and waits for the software to set the bit SPDIFRXEN to 0, in order to clear the error flags.

When SPDIFRXEN is set to 0, the SPDIFRX is disabled, meaning that all the state machines are reset, and RX\_BUF is flushed. Note as well that flags FERR, SERR and TERR are reset.

### 57.3.7 Data reception management

The SPDIFRX offers a double buffer for the audio sample reception. A 32-bit buffer located into the spdifrx\_ker\_ck clock domain (RX\_BUF), and the SPDIFRX\_FMTx\_DR register. The valid data contained into the RX\_BUF are immediately transferred into SPDIFRX\_FMTx\_DR if SPDIFRX\_FMTx\_DR is empty.

The valid data contained into the RX\_BUF are transferred into SPDIFRX\_FMTx\_DR when the two following conditions are reached:

- The transition between the parity bit (P) and the next preamble is detected (this indicated that the word is completely received).
- The SPDIFRX\_FMTx\_DR is empty.

Having a 2-word buffer gives more flexibility for the latency constraint.

The maximum latency allowed is  $T_{\text{SAMPLE}} - 2T_{\text{PCLK}} - 2T_{\text{spdifrx\_ker\_ck}}$

Where  $T_{\text{SAMPLE}}$  is the audio sampling rate of the received stereo audio samples,  $T_{\text{PCLK}}$  is the period of spdifrx\_pclk clock, and  $T_{\text{spdifrx\_ker\_ck}}$  is the period of spdifrx\_ker\_ck clock.

The SPDIFRX offers the possibility to use either DMA (spdifrx\_dat\_dma and spdifrx\_ctrl\_dma) or interrupts for transferring the audio samples into the memory. The recommended option is DMA, refer to [Section 57.3.12: DMA interface](#) for additional information.

The SPDIFRX offers several way on handling the received data. The user can either have a separate flow for control information and audio samples, or get them all together.

For each sub-frame, the data reception register SPDIFRX\_FMTx\_DR contains the 24 data bits, and optionally the V, U, C, PE status bits, and the PT (see [Mixing data and control flow](#)).

Note that PE bit stands for parity rror bit, and is set to 1 when a parity error is detected in the decoded sub-frame.

The PT field carries the preamble type (B, M or W).

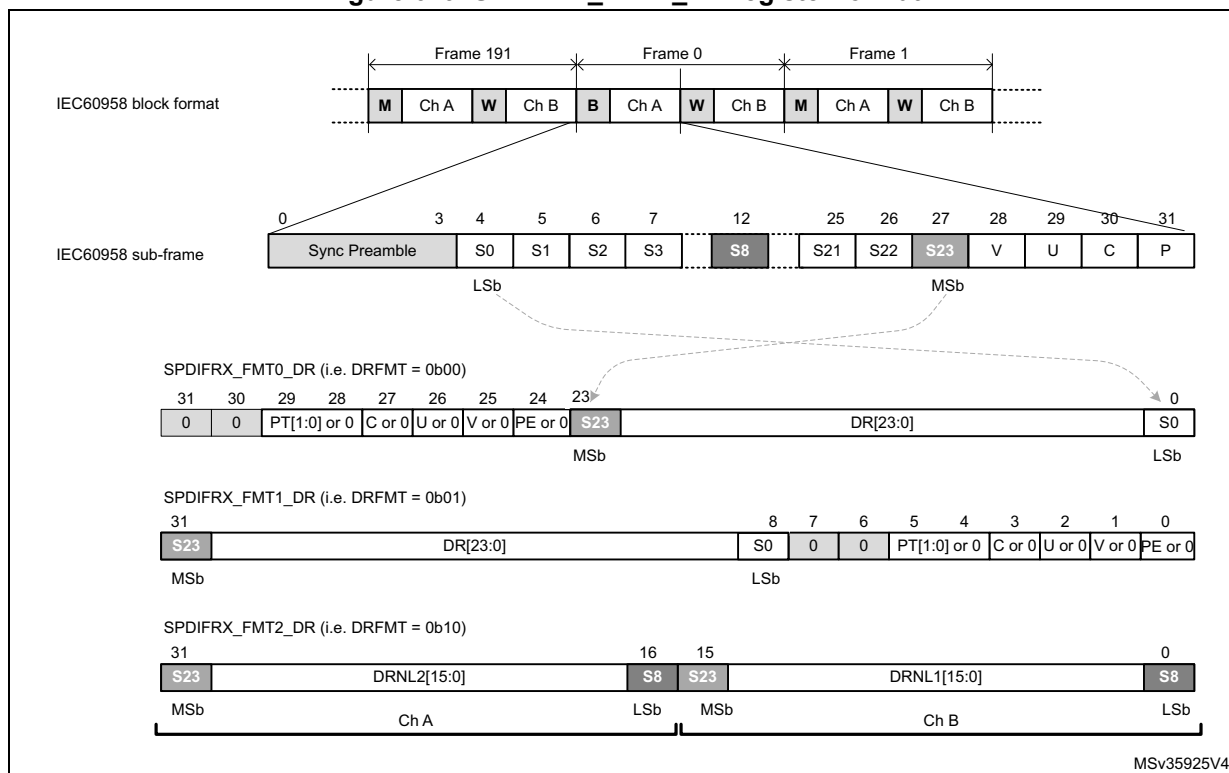

V, U and C are a direct copy of the value received from the S/PDIF interface.

The bit DRFMT allows the selection between 3 audio formats as shown in [Figure 649](#).

This document describes 3 data registers: SPDIFRX\_FMTx[2:0] (x = 2 to 0), but in reality there is only one physical data register, having 3 possible formats:

- When DRFMT = 0, the format of the data register is the one described by SPDIFRX\_FMT0\_DR
- When DRFMT = 1, the format of the data register is the one described by SPDIFRX\_FMT1\_DR
- When DRFMT = 2, the format of the data register is the one described by SPDIFRX\_FMT2\_DR"

Figure 649. SPDIFRX\_FMTx\_DR register format

MSv35925V4

Setting DRFMT to 00 or 01, offers the possibility to have the data either right or left aligned into the SPDIFRX\_FMTx\_DR register. The status information can be enabled or forced to zero according to the way the software wants to handle them.

The format given by DRFMT= 10 is interesting in non-linear mode, as only 16 bits per sub-frame are used. By using this format, the data of two consecutive sub-frames are stored into SPDIFRX\_FMTx\_DR, dividing by two the amount of memory footprint. Note that when RXSTEO = 1, there is no misalignment risks (i.e. data from ChA are always stored into SPDIFRX\_FMTx\_DR[31:16]). If RXSTEO = 0, then there is a misalignment risk in case of overrun situation. In that case SPDIFRX\_FMTx\_DR[31:16] always contain the oldest value and SPDIFRX\_FMTx\_DR[15:0] the more recent value (see [Figure 651](#)).

In this format the status information cannot be mixed with data, but the user can still get them through SPDIFRX\_CSR register, and use a dedicated DMA channel or interrupt to transfer them to memory (see [Section 57.3.8: Dedicated control flow](#))

### Mixing data and control flow

The user can choose to use this mode in order to get the full flexibility of the handling of the control flow. The user can select which field must be kept into the data register (SPDIFRX\_FMTx\_DR).

- When bit PMSK = 1, the parity error information is masked (set to 0), otherwise it is copied into SPDIFRX\_FMTx\_DR.
- When bit VMSK = 1, the validity information is masked (set to 0), otherwise it is copied into SPDIFRX\_FMTx\_DR.

- When bit CUMSK = 1, the channel status, and used data information are masked (set to 0), otherwise they are copied into SPDIFRX\_FMTx\_DR.
- When bit PTMSK = 1, the preamble type is masked (set to 0), otherwise it is copied into SPDIFRX\_FMTx\_DR.

### 57.3.8 Dedicated control flow

The SPDIFRX offers the possibility to catch both user data and channel status information via a dedicated DMA channel. This feature allows the SPDIFRX to acquire continuously the channel status and user information. The acquisition starts at the beginning of a IEC 60958 block. Two fields are available to control this path: CBDMAEN and SPDIFRXEN. When SPDIFRXEN is set to 01 or 0x11, the acquisition is started, after completion of the synchronization phase. When 8 channel status and 16 user data bits are received, they are packed and stored into SPDIFRX\_CSR register. A DMA request is triggered if the bit CBDMAEN is set to 1 (see [Figure 650](#)).

If CS[0] corresponds to the first bit of a new block, the bit SOB is set to 1. Refer to [Section 57.5.8: SPDIFRX channel status register \(SPDIFRX\\_CSR\)](#). A bit is available (CHSEL) in order to select if the user wants to select channel status information (C) from the channel A or B.

Figure 650. Channel/user data format

**Note:** Once the first start of block is detected (B preamble), the SPDIFRX is checking the preamble type every 8 frames.

**Note:** Overrun error on SPDIFRX\_FMTx\_DR register does not affect this path.

### 57.3.9 Reception errors

#### Frame structure and synchronization error

The SPDIFRX, detects errors, when one of the following condition occurs:

- The FERR bit is set to 1 on the following conditions:
  - For each of the 28 information bits, if one symbol transition sequence is not correct: for example if short pulses are not grouped by pairs.
  - If preambles occur to an unexpected place, or an expected preamble is not received.
- The SERR bit is set when the synchronization fails, because the number of re-tries exceeded the programmed value.
- The TERR bit is set when the counter used to estimate the width between two transitions overflows (TRCNT).  
The overflow occurs when no transition is detected during 8192 periods of `spdifrx_ker_ck` clock. It represents at most a time interval of 11.6 frames.

When one of those flags goes to 1, the traffic on selected SPDIFRX\_IN is then ignored, an interrupt is generated if the IFEIE bit of the SPDIFRX\_CR register is set.

The normal procedure when one of those errors occur is:

- Set SPDIFRXEN to 0 in order to clear the error flags
- Set SPDIFRXEN to 01 or 11 in order to restart the SPDIFRX

Refer to [Figure 648](#) for additional information.

#### Parity error

For each sub-frame, an even number of zeros and ones is expected inside the 28 information bits. If not, the parity error bit PERR is set in the SPDIFRX\_SR register and an interrupt is generated if the parity interrupt enable PERRIE bit is set in the SPDIFRX\_CR register. The reception of the incoming data is not paused, and the SPDIFRX continue to deliver data to SPDIFRX\_FMTx\_DR even if the interrupt is still pending.

The interrupt is acknowledged by clearing the PERR flag through PERRCF bit.

If the software wants to guarantee the coherency between the data read in the SPDIFRX\_FMTx\_DR register and the value of the bit PERR, the bit PMSK must be set to 0.

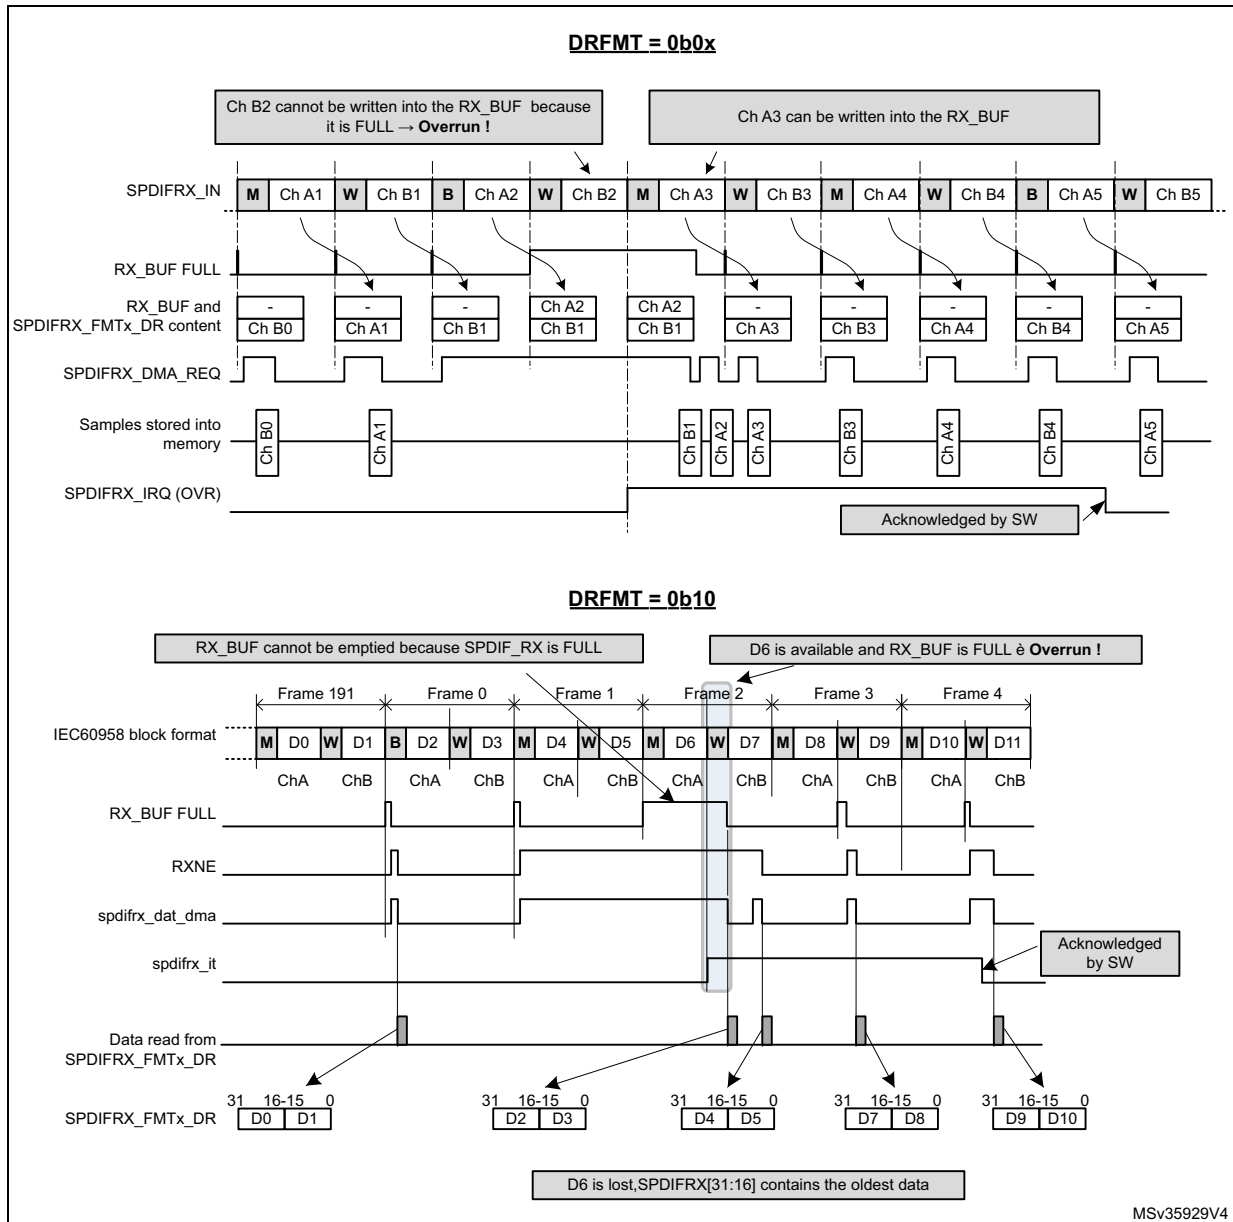

#### Overrun error

If both SPDIFRX\_FMTx\_DR and RX\_BUF are full, while the SPDIFRX\_DC needs to write a new sample in RX\_BUF, this new sample is dropped, and an overrun condition is triggered. The overrun error flag OVR is set in the SPDIFRX\_SR register and an interrupt is generated if the OVRIE bit of the SPDIFRX\_CR register is set.

If the RXSTEO bit is set to 0, then as soon as the RX\_BUF is empty, the SPDIFRX stores the next incoming data, even if the OVR flag is still pending. The main purpose is to reduce as much as possible the amount of lost samples. Note that the behavior is similar independently of DRFMT value. See [Figure 651](#).

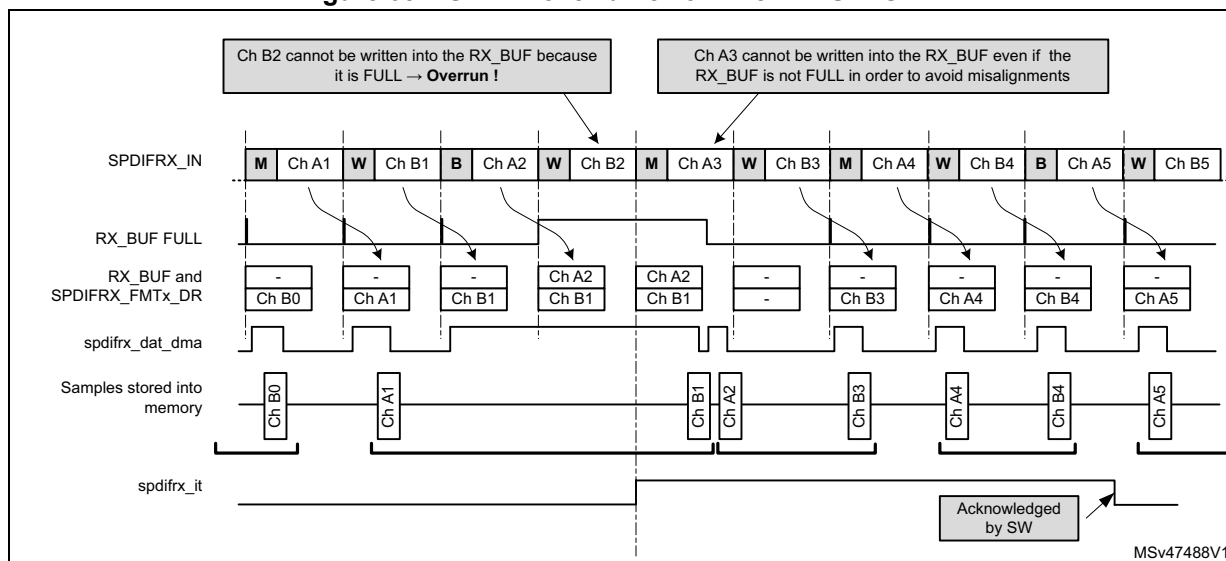

Figure 651. S/PDIF overrun error when RXSTEO = 0

If the RXSTEO bit is set to 1, it means that stereo data are transported, then the SPDIFRX has to avoid misalignment between left and right channels. So the peripheral has to drop a second sample even if there is room inside the RX\_BUF in order to avoid misalignment. Then the incoming samples can be written normally into the RX\_BUF even if the OVR flag is still pending. Refer to [Figure 652](#).

The OVR flag is cleared by software, by setting the OVRCF bit to 1.

Figure 652. S/PDIF overrun error when RXSTEO = 1

### 57.3.10 Clocking strategy

The SPDIFRX block needs two different clocks:

- The APB clock (`spdifrx_pclk`), which is used for the register interface,
- The `spdifrx_ker_ck` which is mainly used by the SPDIFRX\_DC part. Those clocks are not supposed to be phase locked, so all signals crossing those clock domains are re-synchronized (SYNC block on [Figure 638](#)).

In order to decode properly the incoming S/PDIF stream the SPDIFRX\_DC must re-sample the received data with a clock at least 11 times higher than the maximum symbol rate, or 704 times higher than the audio sample rate. For example if the user expects to receive a symbol rate to up to 12.288 MHz, the sample rate must be at least 135.2 MHz. The clock used by the SPDIFRX\_DC is the `spdifrx_ker_ck`.

The frequency of the `spdifrx_pclk` must be at least equal to the symbol rate.

Table 426. Minimum `spdifrx_ker_ck` frequency versus audio sampling rate<sup>(1)</sup>

Symbol rate	Minimum <code>spdifrx_ker_ck</code> frequency	Comments
3.072 MHz	33.8 MHz	For 48 kHz stream
6.144 MHz	67.6 MHz	For 96 kHz stream
12.288 MHz	135.2 MHz	For 192 kHz stream

1. Check the RCC capabilities in order to verify which sampling rates can be supported.

### 57.3.11 Symbol clock generation

The SPDIFRX block provides a symbol clock on signal named `spdifrx_symb_ck`, which can be used as the reference kernel clock for another audio device such as SAI or SPI/I2S. It can be used for SPDIFRX to I2S bridge function.

The symbol clock is built using the values of WIDTH24, WIDTH40 and the symbol boundaries.

- During the reception of the sub-frame sync preambles, the falling and rising edges of the symbol clock are built from the WIDTH24 and WIDTH40 values. Note that WIDTH24 and WIDTH40 are also used for the generation of the symbol clock, when the SPDIFRX is STATE\_STOP or STATE\_IDLE. See [Table 427](#) for details.
- During the reception of the sub-frame payload, the SPDIFRX uses the symbols boundaries to generate the rising edge, the WIDTH24 and WIDTH40 values for the generation of the falling edge.

The duty cycle of the symbol clock is close to 50% during the reception of the sub-frame payload. However, the duty cycle can be altered when the SPDIFRX transitions from a symbol clock generated with WIDTH24 and WIDTH40 to a clock generated by the symbol clock boundaries or vice-versa.

The symbol clock has an important jitter mainly due to:

- The re-sampling of the S/PDIF signal with spdifrx\_ker\_ck clock
- The transition of the symbol clock generation mode

For that reason the application must consider the quality degradation if the symbol clock is used as the reference clock for A/D or D/A converters.

The generation of this symbol clock is controlled by the CKSEN bit. When CKSEN = '1', the clock symbol is generated when the SPDIFRX completes successfully the first fine synchronization (SYNCD = 1), and when it receives correct data from the selected SPDIFRX input.

When the SPDIFRX goes to STATE\_STOP, or STATE\_IDLE, the symbol clock is gated if the bit CKSBKPEN = '0'. If the CKSBKPEN = '1', then a backup symbol clock is still generated if the SPDIFRX is properly synchronized (i.e. valid values available for WIDTH24 and WIDTH40). [Table 427](#) gives more details on the conditions controlling the generation of the symbol clock.

**Table 427. Conditions of spdifrx\_symb\_ck generation**

SPDIFRX states and conditions	CKSEN	CKSBKPEN	spdifrx_symb_ck state
Any state	0	X	Disabled
– SPDIFRX in STATE_SYNC and completing successfully the fine synchronization (SYNCD = '1') or, – SPDIFRX in STATE_RCV, and valid data are received via the selected SPDIFRX input.	1	0	Enabled
– SPDIFRX in STATE_IDLE or, – SPDIFRX in STATE_STOP or, – SPDIFRX did not complete the fine synchronization (on-going) – SPDIFRX is in STATE_RCV, but no data (transitions) detected on the selected SPDIFRX input.		0	Disabled

**Table 427. Conditions of spdifrx\_symb\_ck generation (continued)**

SPDIFRX states and conditions	CKSEN	CKSBKPEN	spdifrx_symb_ck state
– SPDIFRX in STATE_IDLE, but with valid values for WIDTH40 and WIDTH24 or – SPDIFRX in STATE_SYNC and completing successfully the fine synchronization (SYNCD = '1') or, – SPDIFRX in STATE_SYNC the on-going fine synchronization is not completed, but WIDTH40 and WIDTH24 contain the valid values from the previous synchronization or, – SPDIFRX in STATE_RCV, and valid data are received via the selected SPDIFRX input or, – SPDIFRX in STATE_STOP, but with valid values for WIDTH40 and WIDTH24.	1	1	Enabled
– SPDIFRX in IDLE, with invalid values for WIDTH40 and WIDTH24 or, – SPDIFRX in STOP with invalid values for WIDTH40 and WIDTH24 (SERR = '1') or, – SPDIFRX in STATE_SYNC with invalid values for WIDTH40 and WIDTH24, and did not completed the on-going fine synchronization or, – SPDIFRX in STATE_RCV and no transitions detected on the selected SPDIFRX input			Disabled

Note that when the flag SERR is set to '1', neither the symbol clock nor the backup clock can be generated, since there is no synchronization.

Note that when both CKSEN and CKSBKPEN are set to '1', the symbol clock loses some transitions when the SPDIFRX switches from STATE\_SYNC or STATE\_RCV to STATE\_STOP, or STATE\_IDLE.

The bits CKSEN and CKSBKPEN are located into [SPDIFRX control register \(SPDIFRX\\_CR\)](#).

### 57.3.12 DMA interface

The SPDIFRX interface is able to perform communication using the DMA.

*Note:* The user must refer to product specifications for availability of the DMA controller.

The SPDIFRX offers two independent DMA channels:

- A DMA channel dedicated to the data transfer
- A DMA channel dedicated to the channel status and user data transfer

The DMA mode for the data can be enabled for reception by setting the RXDMAEN bit in the SPDIFRX\_CR register. In this case, as soon as the SPDIFRX\_FMTx\_DR is not empty, the SPDIFRX interface sends a transfer request to the DMA. The DMA reads the data received through the SPDIFRX\_FMTx\_DR register without CPU intervention.

For the use of DMA for the control data refer to [Section 57.3.8: Dedicated control flow](#).

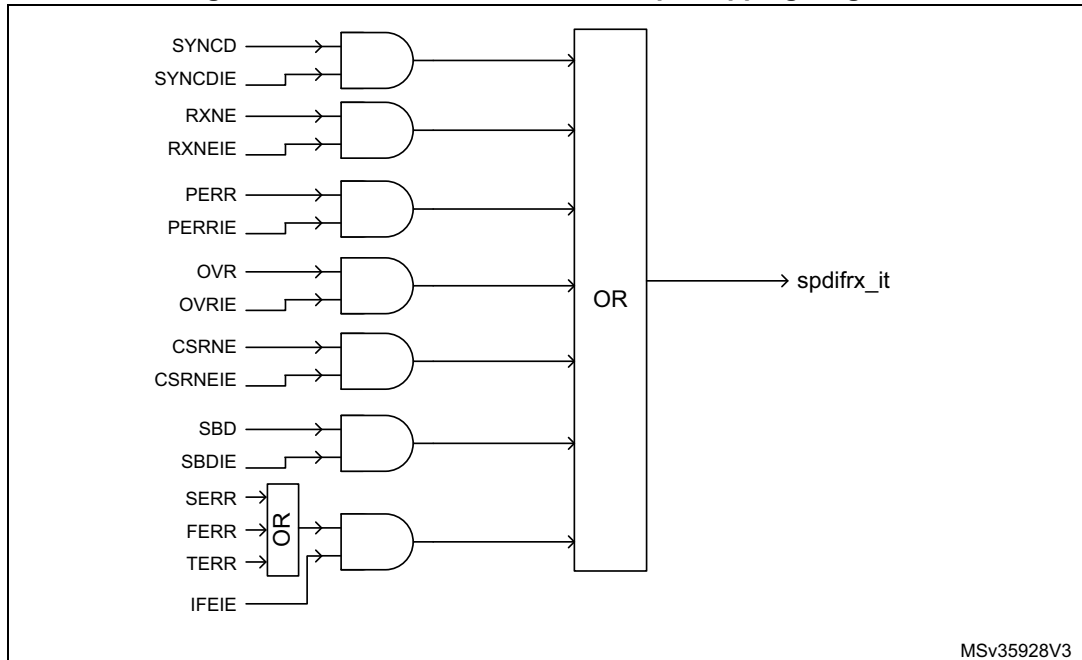

### 57.3.13 Interrupt generation

An interrupt line is shared between:

- Reception events for data flow (RXNE)
- Reception event for control flow (CSRNE)

- Data corruption detection (PERR)
- Transfer flow interruption (OVR)
- Frame structure and synchronization errors (SERR, TERR and FERR)
- Start of new block interrupt (SBD)
- Synchronization done (SYNCD)

**Figure 653. SPDIFRX interface interrupt mapping diagram**

### Clearing interrupt source

- RXNE is cleared when SPDIFRX\_FMTx\_DR register is read
- CSRNE is cleared when SPDIFRX\_CSR register is read
- FERR is cleared when SPDIFRXEN is set to 0
- SERR is cleared when SPDIFRXEN is set to 0
- TERR is cleared when SPDIFRXEN is set to 0
- Others are cleared through SPDIFRX\_IFCR register

*Note:* The SBD event can only occur when the SPDIFRX is synchronized to the input stream (SYNCD = 1).  
The SBD flag behavior is not guaranteed when the sub-frame which contains the B preamble is lost due to an overrun.

### 57.3.14 Register protection

The SPDIFRX block embeds some hardware protection avoid erroneous use of control registers. The table hereafter shows the bit field properties according to the SPDIFRX state.

**Table 428. Bit field property versus SPDIFRX state**

Registers	Field	SPDIFRXEN		
		00 (STATE_IDLE)	01 (STATE_SYNC)	11 (STATE_RCV)
SPDIFRX_CR	INSEL	rw	r	r
	WFA	rw	r	r
	NBTR	rw	r	r
	CHSEL	rw	r	r
	CBDMAEN	rw	rw	rw
	PTMSK	rw	rw	rw
	CUMSK	rw	rw	rw
	VMSK	rw	rw	rw
	PMSK	rw	rw	rw
	DRFMT	rw	rw	r
	RXSTEO	rw	rw	r
	RXDMAEN	rw	rw	rw
SPDIFRX_IMR	All fields	rw	rw	rw

The table clearly shows that fields such as INSEL must be programmed when the SPDIFRX is in STATE\_IDLE. In the others SPDIFRX states, the hardware prevents writing to this field.

*Note:* Even if the hardware allows the writing of CBDMAEN and RXDMAEN “on-the-fly”, it is not recommended to enable the DMA when the SPDIFRX already receives data.  
 Each of the mask bits (such as PMSK, VMSK) can be changed “on-the-fly” at any SPDIFRX state, but any change does not affect data which are already hold in SPDIFRX\_FMTx\_DR.

## 57.4 Programming procedures

The following example illustrates a complete activation sequence of the SPDIFRX block. The data path and channel status and user information both use a dedicated DMA channel. The activation sequence is then split into the following steps:

- Wait for valid data on the selected SPDIFRX\_IN input
- Synchronize to the S/PDIF stream
- Read the channel status and user information in order to setup the complete audio path
- Start data acquisition

A simple way to check if valid data are available into the SPDIFRX\_IN line is to switch the SPDIFRX into the STATE\_SYNC, with bit WFA set to 1. The description hereafter focuses on detection. It is also possible to implement this function as follows:

- The software has to check from time to time (i.e. every 100 ms for example) if the SPDIFRX can find synchronization. This can be done by checking if the bit TERR is set. When it is set it indicates that no activity has been found.
- Connect the SPDIFRX\_IN input to an external interrupt event block in order to detect transitions of SPDIFRX\_IN line. When activity is detected, then SPDIFRXEN can be set to 01 or 11.

For those two implementations, the bit WFA is set to 0.

### 57.4.1 Initialization phase

- The initialization function looks like this:
- Configure the DMA transfer for both audio samples and IEC60958 channel status and user information (DMA channel selection and activation, priority, number of data to transfer, circular/no circular mode, DMA interrupts)
- Configure the destination address:
  - Configure the address of the SPDIFRX\_CSR register as source address for IEC60958 channel status and user information
  - Configure the address of the SPDIFRX\_FMTx\_DR register as source address for audio samples
  - Enable the generation of the spdifrx\_ker\_ck. Refer to [Table 426](#) in order to define the minimum clock frequency versus supported audio sampling rate. Note that the audio sampling rate of the received stream is not known in advance. This means that the user has to select a spdifrx\_ker\_ck frequency at least 704 times higher than the maximum audio sampling rate the application is supposed to handle: for example if the application is able to handle streams up to 96 kHz, then  $F_{\text{spdifrx\_ker\_ck}}$  must be at least  $704 \times 96 \text{ kHz} = 67.6 \text{ MHz}$
- Enable interrupt for errors and event signaling (IFEIE = SYNCIE = OVRIE, PERRIE = 1, others set to 0). Note that SYNCIE can be set to 0.
- Configure the SPDIFRX\_CR register:
  - INSEL must select the wanted input
  - NBTR = 2, WFA = 1 (16 re-tries allowed, wait for activity before going to synchronization phase),
  - PTMSK = CUMSK = 1 (Preamble, C and U bits are not mixed with data)
  - VMSK = PMSK = 0 (Parity error and validity bit mixed with data)
  - CHSEL = 0 (channels status are read from sub-frame A)
  - DRFMT = 01 (data aligned to the left)
  - RXSTEO = 1 (expected stereo mode linear)
  - CBDMAEN = RXDMAEN = 1 (enable DMA channels)
  - SPDIFRXEN = 01 (switch SPDIFRX to STATE\_SYNC)
- The CPU can enter in WFI mode

Then the CPU receives interrupts coming either from DMA or SPDIFRX.

### 57.4.2 Handling of interrupts coming from SPDIFRX

When an interrupt from the SPDIFRX is received, then the software has to check what is the source of the interrupt by reading the SPDIFRX\_SR register.

- If SYNCD is set to 1, then it means that the synchronization is properly completed. No action has to be performed in our case as the DMA is already programmed. The software just needs to wait for DMA interrupt in order to read channel status information.  
The SYNCD flag must be cleared by setting SYNCD CF bit of SPDIFRX\_IFCR register to 1.
- If TERR or SERR or FERR are set to 1, the software has to set SPDIFRXEN to 0, and re-start from the initialization phase.
  - TERR indicates that a time-out occurs either during synchronization phase or after.
  - SERR indicates that the synchronization fails because the maximum allowed re-tries are reached.
  - FERR indicates that the reading of information after synchronization fails (such as unexpected preamble, bad data decoding).
- If PERR is set to 1, it means that a parity error is detected, so one of the received audio sample or the channel status or user data bits are corrupted. The action taken here depends on the application: one action can be to drop the current channel status block as it is not reliable. There is no need to re-start from the initialization phase, as the synchronization is not lost.  
The PERR flag must be cleared by setting PERR CF bit of SPDIFRX\_IFCR register to 1.

### 57.4.3 Handling of interrupts coming from DMA

If an interrupt comes from the DMA channel used of the channel status (SPDIFRX\_CSR):

If no error occurred (that is PERR), the CPU can start the decoding of channel information. For example bit 1 of the channel status informs the user if the current stream is linear or not. This information is very important in order to set-up the proper processing chain. In the same way, bits 24 to 27 of the channel status give the sampling frequency of the stream incoming stream.

Thanks to that information, the user can then configure the RXSTEO bit and DRFMT field prior to start the data reception. For example if the current stream is non linear PCM then RXSTEO is set to 0, and DRFMT is set to 10. Then the user can enable the data reception by setting SPDIFRXEN to 11.

The SOB bit, when set to 1 indicates the start of a new block. This information helps the software to identify the bit 0 of the channel status. Note that if the DMA generates an interrupt every time 24 values are transferred into the memory, then the first word always corresponds to the start of a new block.

If an interrupt comes from the DMA channel used of the audio samples (SPDIFRX\_FMTx\_DR):

The process performed here depends of the data type (linear or non-linear), and on the data format selected.

For example in linear mode, if PE or V bit is set a special processing can be performed locally in order to avoid spurs on output. In non-linear mode those bits are not important as data frame have their own checksum.

## 57.5 SPDIFRX interface registers

### 57.5.1 SPDIFRX control register (SPDIFRX\_CR)

Only 32-bit accesses are allowed in this register.

Address offset: 0x00

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CKS BKP EN	CKSEN	Res.	INSEL[2:0]		
										rw	rw		rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	WFA	NBTR[1:0]		CHSEL	CBDMAEN	PTMSK	CUMSK	VMSK	PMSK	DRFMT[1:0]		RXSTEO	RXDMAEN	SPDIFRXEN[1:0]	
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **CKSBKPEN**: Backup symbol clock enable

This bit is set/reset by software.

1: The SPDIFRX generates a backup symbol clock if CKSEN = 1.

0: The SPDIFRX does not generate a backup symbol clock.

Bit 20 **CKSEN**: Symbol clock enable

This bit is set/reset by software.

1: The SPDIFRX generates a symbol clock.

0: The SPDIFRX does not generate a symbol clock.

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **INSEL[2:0]**: SPDIFRX input selection<sup>(1)</sup>

000: SPDIFRX\_IN1 selected

001: SPDIFRX\_IN2 selected

010: SPDIFRX\_IN3 selected

011: SPDIFRX\_IN4 selected

other: reserved

Bit 15 Reserved, must be kept at reset value.

Bit 14 **WFA**: Wait for activity<sup>(1)</sup>

This bit is set/reset by software.

1: The SPDIFRX waits for activity on SPDIFRX\_IN line (4 transitions) before performing the synchronization.

0: The SPDIFRX does not wait for activity on SPDIFRX\_IN line before performing the synchronization.

- Bits 13:12 **NBTR[1:0]**: Maximum allowed re-tries during synchronization phase<sup>(1)</sup>
- 00: No re-try is allowed (only one attempt)
  - 01: 3 re-tries allowed
  - 10: 15 re-tries allowed
  - 11: 63 re-tries allowed
- Bit 11 **CHSEL**: Channel selection<sup>(1)</sup>
- This bit is set/reset by software.
- 1: The control flow takes the channel status from channel B.
  - 0: The control flow takes the channel status from channel A.
- Bit 10 **CBDMAEN**: Control buffer DMA enable for control flow<sup>(1)</sup>
- This bit is set/reset by software.
- 1: DMA mode is enabled for reception of channel status and used data information.
  - 0: DMA mode is disabled for reception of channel status and used data information.
- Note: When this bit is set, the DMA request is made whenever the CSRNE flag is set.*
- Bit 9 **PTMSK**: Mask of preamble type bits<sup>(1)</sup>
- This bit is set/reset by software.
- 1: The preamble type bits are not copied into the SPDIFRX\_FMTx\_DR, zeros are written instead.
  - 0: The preamble type bits are copied into the SPDIFRX\_FMTx\_DR.
- Bit 8 **CUMSK**: Mask of channel status and user bits<sup>(1)</sup>
- This bit is set/reset by software.
- 1: The channel status and user bits are not copied into the SPDIFRX\_FMTx\_DR, zeros are written instead.
  - 0: The channel status and user bits are copied into the SPDIFRX\_FMTx\_DR.
- Bit 7 **VMSK**: Mask of validity bit<sup>(1)</sup>
- This bit is set/reset by software.
- 1: The validity bit is not copied into the SPDIFRX\_FMTx\_DR, a zero is written instead.
  - 0: The validity bit is copied into the SPDIFRX\_FMTx\_DR.
- Bit 6 **PMSK**: Mask parity error bit<sup>(1)</sup>
- This bit is set/reset by software.
- 1: The parity error bit is not copied into the SPDIFRX\_FMTx\_DR, a zero is written instead.
  - 0: The parity error bit is copied into the SPDIFRX\_FMTx\_DR.
- Bits 5:4 **DRFMT[1:0]**: RX data format<sup>(1)</sup>
- This bit is set/reset by software.
- 11: reserved
  - 10: Data sample are packed by setting two 16-bit sample into a 32-bit word.
  - 01: Data samples are aligned in the left (MSB)
  - 00: Data samples are aligned in the right (LSB).

Bit 3 **RXSTEO**: Stereo mode<sup>(1)</sup>

This bit is set/reset by software.  
 1: The peripheral is in stereo mode.  
 0: The peripheral is in mono mode.

*Note: This bit is used in case of overrun situation in order to handle misalignment.*

Bit 2 **RXDMAEN**: Receiver DMA enable for data flow<sup>(1)</sup>

This bit is set/reset by software.  
 1: DMA mode is enabled for reception.  
 0: DMA mode is disabled for reception.

*Note: When this bit is set, the DMA request is made whenever the RXNE flag is set.*

Bits 1:0 **SPDIFRXEN[1:0]**: Peripheral block enable<sup>(1)</sup>

This field is modified by software.  
 It must be used to change the peripheral phase among the three possible states: STATE\_IDLE, STATE\_SYNC and STATE\_RCV.  
 00: Disable SPDIFRX (STATE\_IDLE).  
 01: Enable SPDIFRX synchronization only.  
 10: Reserved  
 11: Enable SPDIF receiver.

*Note: It is not possible to transition from STATE\_RCV to STATE\_SYNC, the user must first go the STATE\_IDLE.  
 it is possible to transition from STATE\_IDLE to STATE\_RCV: in that case the peripheral transitions from STATE\_IDLE to STATE\_SYNC and as soon as the synchronization is performed goes to STATE\_RCV.*

1. Refer to [Section 57.3.14: Register protection](#) for additional information on fields properties.

### 57.5.2 SPDIFRX interrupt mask register (SPDIFRX\_IMR)

Address offset: 0x04

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IFE IE	SYNCD IE	SBLK IE	OVR IE	PERR IE	CSRNE IE	RXNE IE
									rw	rw	rw	rw	rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **IFEIE**: Serial interface error interrupt enable

This bit is set and cleared by software.  
 0: Interrupt is inhibited.  
 1: A SPDIFRX interface interrupt is generated whenever SERR = 1, TERR = 1, or FERR = 1 in the SPDIFRX\_SR register.

Bit 5 **SYNCDIE**: Synchronization done

This bit is set and cleared by software.  
 0: Interrupt is inhibited.  
 1: A SPDIFRX interface interrupt is generated whenever SYNCD = 1 in the SPDIFRX\_SR register.

- Bit 4 **SBLKIE**: Synchronization block detected interrupt enable  
 This bit is set and cleared by software.  
 0: Interrupt is inhibited.  
 1: A SPDIFRX interface interrupt is generated whenever SBD = 1 in the SPDIFRX\_SR register.
- Bit 3 **OVRIE**: Overrun error interrupt enable  
 This bit is set and cleared by software.  
 0: Interrupt is inhibited.  
 1: A SPDIFRX interface interrupt is generated whenever OVR=1 in the SPDIFRX\_SR register.
- Bit 2 **PERRIE**: Parity error interrupt enable  
 This bit is set and cleared by software.  
 0: Interrupt is inhibited.  
 1: A SPDIFRX interface interrupt is generated whenever PERR=1 in the SPDIFRX\_SR register.
- Bit 1 **CSRNEIE**: Control buffer ready interrupt enable  
 This bit is set and cleared by software.  
 0: Interrupt is inhibited.  
 1: A SPDIFRX interface interrupt is generated whenever CSRNE = 1 in the SPDIFRX\_SR register.
- Bit 0 **RXNEIE**: RXNE interrupt enable  
 This bit is set and cleared by software.  
 0: Interrupt is inhibited.  
 1: A SPDIFRX interface interrupt is generated whenever RXNE=1 in the SPDIFRX\_SR register.

### 57.5.3 SPDIFRX status register (SPDIFRX\_SR)

Address offset: 0x08

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.		WIDTH5[14:0]													
	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	TERR	SERR	FERR	SYNCD	SBD	OVR	PERR	CSRNE	RXNE
							r	r	r	r	r	r	r	r	r

Bit 31 Reserved, must be kept at reset value.

Bits 30:16 **WIDTH5[14:0]**: duration of 5 symbols counted with spdifrx\_ker\_ck

This value represents the amount of spdifrx\_ker\_ck clock periods contained on a length of 5 consecutive symbols. This value can be used to estimate the S/PDIF symbol rate. Its accuracy is limited by the frequency of spdifrx\_ker\_ck.

For example if the spdifrx\_ker\_ck is fixed to 84 MHz, and WIDTH5 = 147d. The estimated sampling rate of the S/PDIF stream is:

$$F_s = 5 \times F_{\text{spdifrx\_ker\_ck}} / (\text{WIDTH5} \times 64) \sim 44.6 \text{ kHz, so the closest standard sampling rate is } 44.1 \text{ kHz.}$$

Note that WIDTH5 is updated by the hardware when SYNCD goes high, and then every frame.

Bits 15:9 Reserved, must be kept at reset value.

**Bit 8 TERR:** Time-out error

This bit is set by hardware when the counter TRCNT reaches its max value. It indicates that the time interval between two transitions is too long. It generally indicates that there is no valid signal on SPDIFRX\_IN input.

This flag is cleared by writing SPDIFRXEN to 0.

An interrupt is generated if IFEIE=1 in the SPDIFRX\_IMR register.

0: No sequence error is detected.

1: Sequence error is detected.

**Bit 7 SERR:** Synchronization error

This bit is set by hardware when the synchronization fails due to amount of re-tries for NBTR.

This flag is cleared by writing SPDIFRXEN to 0.

An interrupt is generated if IFEIE = 1 in the SPDIFRX\_IMR register.

0: No synchronization error is detected.

1: Synchronization error is detected.

**Bit 6 FERR:** Framing error

This bit is set by hardware when an error occurs during data reception: such as preamble not at the expected place, short transition not grouped by pairs.

This is set by the hardware only if the synchronization is completed (SYNCD = 1).

This flag is cleared by writing SPDIFRXEN to 0.

An interrupt is generated if IFEIE=1 in the SPDIFRX\_IMR register.

0: No Manchester violation detected

1: Manchester violation detected

**Bit 5 SYNCD:** Synchronization done

This bit is set by hardware when the initial synchronization phase is properly completed.

This flag is cleared by writing a 1 to its corresponding bit on SPDIFRX\_IFCR register.

An interrupt is generated if SYNCDIE = 1 in the SPDIFRX\_IMR register.

0: Synchronization is pending.

1: Synchronization is completed.

**Bit 4 SBD:** Synchronization block detected

This bit is set by hardware when a "B" preamble is detected.

This flag is cleared by writing a 1 to its corresponding bit on SPDIFRX\_IFCR register.

An interrupt is generated if SBLKIE = 1 in the SPDIFRX\_IMR register.

0: No "B" preamble is detected.

1: "B" preamble is detected.

**Bit 3 OVR:** Overrun error

This bit is set by hardware when a received data is ready to be transferred in the SPDIFRX\_FMTx\_DR register while RXNE = 1 and both SPDIFRX\_FMTx\_DR and RX\_BUF are full.

This flag is cleared by writing a 1 to its corresponding bit on SPDIFRX\_IFCR register.

An interrupt is generated if OVRIE=1 in the SPDIFRX\_IMR register.

0: No overrun error

1: Overrun error is detected.

*Note: When this bit is set, the SPDIFRX\_FMTx\_DR register content is not lost but the last data received are.*

Bit 2 **PERR**: Parity error

This bit is set by hardware when the data and status bits of the sub-frame received contain an odd number of 0 and 1.

This flag is cleared by writing a 1 to its corresponding bit on SPDIFRX\_IFCR register.

An interrupt is generated if PIE = 1 in the SPDIFRX\_IMR register.

0: No parity error

1: Parity error

Bit 1 **CSRNE**: Control buffer register not empty

This bit is set by hardware when a valid control information is ready.

This flag is cleared when reading SPDIFRX\_CSR register.

An interrupt is generated if CBRDYIE = 1 in the SPDIFRX\_IMR register.

0: No control word available on SPDIFRX\_CSR register

1: A control word is available on SPDIFRX\_CSR register.

Bit 0 **RXNE**: Read data register not empty

This bit is set by hardware when a valid data is available into SPDIFRX\_FMTx\_DR register.

This flag is cleared by reading the SPDIFRX\_FMTx\_DR register.

An interrupt is generated if RXNEIE=1 in the SPDIFRX\_IMR register.

0: Data is not received.

1: Received data is ready to be read.

### 57.5.4 SPDIFRX interrupt flag clear register (SPDIFRX\_IFCR)

Address offset: 0x0C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SYNCD CF	SBD CF	OVR CF	PERR CF	Res.	Res.
										w	w	w	w		

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **SYNDCF**: clears the synchronization done flag

Writing 1 in this bit clears the flag SYNCD in the SPDIFRX\_SR register.

Reading this bit always returns the value 0.

Bit 4 **SBD**CF: clears the synchronization block detected flag

Writing 1 in this bit clears the flag SBD in the SPDIFRX\_SR register.

Reading this bit always returns the value 0.

Bit 3 **OVR**CF: clears the overrun error flag

Writing 1 in this bit clears the flag OVR in the SPDIFRX\_SR register.

Reading this bit always returns the value 0.

Bit 2 **PERR**CF: clears the parity error flag

Writing 1 in this bit clears the flag PERR in the SPDIFRX\_SR register.

Reading this bit always returns the value 0.

Bits 1:0 Reserved, must be kept at reset value.

### 57.5.5 SPDIFRX data input register (SPDIFRX\_FMT0\_DR)

Address offset: 0x10

Reset value: 0x0000 0000

This register can take three different formats according to DRFMT. Here is the format when DRFMT = 00:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	PT[1:0]		C	U	V	PE	DR[23:16]							
		r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:28 **PT[1:0]**: preamble type

These bits indicate the preamble received.

00: not used

01: Preamble B received

10: Preamble M received

11: Preamble W received

Note that if PTMSK = 1, this field is forced to zero

Bit 27 **C**: channel status bit

Contains the received channel status bit, if CUMSK = 0, otherwise it is forced to 0

Bit 26 **U**: user bit

Contains the received user bit, if CUMSK = 0, otherwise it is forced to 0

Bit 25 **V**: validity bit

Contains the received validity bit if VMSK = 0, otherwise it is forced to 0

Bit 24 **PE**: parity error bit

Contains a copy of PERR bit if PMSK = 0, otherwise it is forced to 0

Bits 23:0 **DR[23:0]**: data value

Contains the 24 received data bits, aligned on D[23]

### 57.5.6 SPDIFRX data input register (SPDIFRX\_FMT1\_DR)

Address offset: 0x10

Reset value: 0x0000 0000

This register can take three different formats according to DRFMT. Here is the format when DRFMT = 01:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DR[23:8]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DR[7:0]								Res.	Res.	PT[1:0]		C	U	V	PE
r	r	r	r	r	r	r	r			r	r	r	r	r	r

- Bits 31:8 **DR[23:0]**: data value  
Contains the 24 received data bits, aligned on D[23]
- Bits 7:6 Reserved, must be kept at reset value.
- Bits 5:4 **PT[1:0]**: preamble type  
These bits indicate the preamble received.  
00: not used  
01: preamble B received  
10: preamble M received  
11: preamble W received  
Note that if PTMSK = 1, this field is forced to zero
- Bit 3 **C**: channel Status bit  
Contains the received channel status bit, if CUMSK = 0, otherwise it is forced to 0
- Bit 2 **U**: user bit  
Contains the received user bit, if CUMSK = 0, otherwise it is forced to 0
- Bit 1 **V**: validity bit  
Contains the received validity bit if VMSK = 0, otherwise it is forced to 0
- Bit 0 **PE**: parity error bit  
Contains a copy of PERR bit if PMSK = 0, otherwise it is forced to 0

### 57.5.7 SPDIFRX data input register (SPDIFRX\_FMT2\_DR)

Address offset: 0x10

Reset value: 0x0000 0000

This register can take 3 different formats according to DRFMT.

The data format proposed when DRFMT = 10, is dedicated to non-linear mode, as only 16 bits are used (bits 23 to 8 from S/PDIF sub-frame).

Bits 31:16 **DRNL2[15:0]**: data value  
This field contains the channel A

Bits 15:0 **DRNL1[15:0]**: data value  
This field contains the channel B

### 57.5.8 SPDIFRX channel status register (SPDIFRX\_CSR)

Address offset: 0x14

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	SOB	CS[7:0]							
							r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
USR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **SOB**: start of block

This bit indicates if the bit CS[0] corresponds to the first bit of a new block

- 0: CS[0] is not the first bit of a new block
- 1: CS[0] is the first bit of a new block

Bits 23:16 **CS[7:0]**: channel A status information

Bit CS[0] is the oldest value

Bits 15:0 **USR[15:0]**: user data information

Bit USR[0] is the oldest value, and comes from channel A, USR[1] comes channel B.

So USR[n] bits come from channel A is n is even, otherwise they come from channel B.

### 57.5.9 SPDIFRX debug information register (SPDIFRX\_DIR)

Address offset: 0x18

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	TLO[12:0]												
			r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	THI[12:0]												
			r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:16 **TLO[12:0]**: threshold LOW ( $TLO = 1.5 \times UI / T_{spdifrx\_ker\_ck}$ )

This field contains the current threshold LOW estimation. This value can be used to estimate the sampling rate of the received stream. The accuracy of TLO is limited to a period of the `spdifrx_ker_ck`. The sampling rate can be estimated as follow:

$$\text{Sampling Rate} = [2 \times TLO \times T_{spdifrx\_ker\_ck} \pm T_{spdifrx\_ker\_ck}] \times 2/3$$

Note that TLO is updated by the hardware when SYNCD goes high, and then every frame.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:0 **THI[12:0]**: threshold HIGH (THI = 2.5 x UI / T<sub>spdifrx\_ker\_ck</sub>)

This field contains the current threshold HIGH estimation. This value can be used to estimate the sampling rate of the received stream. The accuracy of THI is limited to a period of the spdifrx\_ker\_ck. The sampling rate can be estimated as follow:

$$\text{Sampling Rate} = [2 \times \text{THI} \times T_{\text{spdifrx\_ker\_ck}} \pm T_{\text{spdifrx\_ker\_ck}}] \times 2/5$$

Note that THI is updated by the hardware when SYNCDC goes high, and then every frame.

### 57.5.10 SPDIFRX interface register map

Table 429. SPDIFRX interface register map and reset values

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Refer to [Section 2.3](#) for the register boundary addresses.

## 58 Single wire protocol master interface (SWPMI)

### 58.1 Introduction

The single wire protocol master interface (SWPMI) is the master interface corresponding to the contactless front-end (CLF) defined in the ETSI TS 102 613 technical specification.

The principle of the Single wire protocol (SWP) is based on the transmission of digital information in full duplex mode:

- S1 signal (from Master to Slave) is transmitted by a digital modulation (L or H) in the voltage domain (refer to [Figure 654: S1 signal coding](#)),
- S2 signal (from Slave to Master) is transmitted by a digital modulation (L or H) in the current domain (refer to [Figure 655: S2 signal coding](#)).

Figure 654. S1 signal coding

Figure 655. S2 signal coding

## 58.2 SWPMI main features

The SWPMI module main features are the following (see [Figure 58.3.4: SWP bus states](#)):

- Full-duplex communication mode
- Automatic SWP bus state management
- Automatic handling of Start of frame (SOF)
- Automatic handling of End of frame (EOF)
- Automatic handling of stuffing bits
- Automatic CRC-16 calculation and generation in transmission
- Automatic CRC-16 calculation and checking in reception
- 32-bit Transmit data register
- 32-bit Receive data register
- Multi software buffer mode for efficient DMA implementation and multi frame buffering
- Configurable bit-rate up to 2 Mbit/s
- Configurable interrupts
- CRC error, underrun, overrun flags
- Frame reception and transmission complete flags
- Slave resume detection flag
- Loopback mode for test purpose
- Embedded SWPMI\_IO transceiver compliant with ETSI TS 102 613 technical specification
- Dedicated mode to output SWPMI\_RX, SWPMI\_TX and SWPMI\_SUSPEND signals on GPIOs, in case of external transceiver connection

## 58.3 SWPMI functional description

### 58.3.1 SWPMI block diagram

Figure 656. SWPMI block diagram

Refer to the bit SWPSEL in [Section 8.7.18: RCC CPU domain kernel clock configuration register \(RCC\\_CDCCIP1R\)](#) to select the swpmi\_ker\_ck (SWPMI core clock source).

*Note:* In order to support the exit from Stop mode by a RESUME by slave, it is mandatory to select HSI for swpmi\_ker\_ck. If this feature is not required, swpmi\_pclk can be selected, and SWPMI must be disabled before entering the Stop mode.

### 58.3.2 SWPMI pins and internal signals

[Table 430](#) lists the SWPMI slave inputs and output signals connected to package pins or balls, while [Table 431](#) shows the internal SWPMI signals.

Table 430. SWPMI input/output signals connected to package pins or balls

Signal name	Signal type	Description
SWPMI_SUSPEND	Digital output	SWPMI suspend signal
SWPMI_TX	Digital output	SWPMI transmit signal

**Table 430. SWPMI input/output signals connected to package pins or balls**

Signal name	Signal type	Description
SWPMI_RX	Digital input	SWPMI receive signal
SWPMI_IO	Input and output	Internal SWPMI transceiver.

**Table 431. SWPMI internal input/output signals**

Signal name	Signal type	Description
swpmi_pclk	Digital input	APB clock
swpmi_ker_ck	Digital input	SWPMI kernel clock
swpmi_wkup	Digital output	SWPMI wakeup signal
swpmi_gbl_it	Digital output	SWPMI interrupt signal
swpmi_tx_dma	Digital output	SWPMI DMA transmit request
swpmi_rx_dma	Digital output	SWPMI DMA receive request

### 58.3.3 SWP initialization and activation

The initialization and activation will set the SWPMI\_IO state from low to high.

When using the internal transceiver, the procedure is the following:

1. Configure the SWP\_CLASS bit in SWPMI\_OR register according to the VDD voltage (3 V or 1.8 V),
2. Set SWPTEN in SWPMI\_CR register to enable the SWPMI\_IO transceiver and set the SWPMI\_IO to low level (SWP bus DEACTIVATED)
3. Wait for the RDYF flag in SWPMI\_SR register to be set (polling the flag or enabling the interrupt with RDYIE bit in SWPMI\_IER register),
4. Set SWPACT bit in SWPMI\_CR register to ACTIVATE the SWP i.e. to move from DEACTIVATED to SUSPENDED.

### 58.3.4 SWP bus states

The SWP bus can have the following states: DEACTIVATED, SUSPENDED, ACTIVATED.

Several transitions are possible:

- **ACTIVATE:** transition from DEACTIVATED to SUSPENDED state,
- **SUSPEND:** transition from ACTIVATED to SUSPENDED state,
- **RESUME by master:** transition from SUSPENDED to ACTIVATED state initiated by the master,
- **RESUME by slave:** transition from SUSPENDED to ACTIVATED state initiated by the slave,
- **DEACTIVATE:** transition from SUSPENDED to DEACTIVATED state.

#### ACTIVATE

During and just after reset, the SWPMI\_IO is configured in analog mode. Refer to [Section 58.3.3: SWP initialization and activation](#) to activate the SWP bus.

#### SUSPEND

The SWP bus stays in the ACTIVATED state as long as there is a communication with the slave, either in transmission or in reception. The SWP bus switches back to the SUSPENDED state as soon as there is no more transmission or reception activity, after 7 idle bits.

#### RESUME by master

Once the SWPMI is enabled, the user can request a SWPMI frame transmission. The SWPMI first sends a transition sequence and 8 idle bits (RESUME by master) before starting the frame transmission. The SWP moves from the SUSPENDED to ACTIVATED state after the RESUME by master (refer to [Figure 657: SWP bus states](#)).

#### RESUME by slave

Once the SWPMI is enabled, the SWP can also move from the SUSPENDED to ACTIVATED state if the SWPMI receives a RESUME from the slave. The RESUME by slave sets the SRF flag in the SWPMI\_ISR register.

#### DEACTIVATE

##### Deactivate request

If no more communication is required, and if SWP is in the SUSPENDED mode, the user can request to switch the SWP to the DEACTIVATED mode by disabling the SWPMI peripheral. The software must set DEACT bit in the SWPMI\_CR register in order to request the DEACTIVATED mode. If no RESUME by slave is detected by SWPMI, the DEACTF flag is set in the SWPMI\_ISR register and the SWPACT bit is cleared in the SWPMI\_ICR register. In case a RESUME by slave is detected by the SWPMI while the software is setting DEACT bit, the SRF flag is set in the SWPMI\_ISR register, DEACTF is kept cleared, SWPACT is kept set and DEACT bit is cleared.

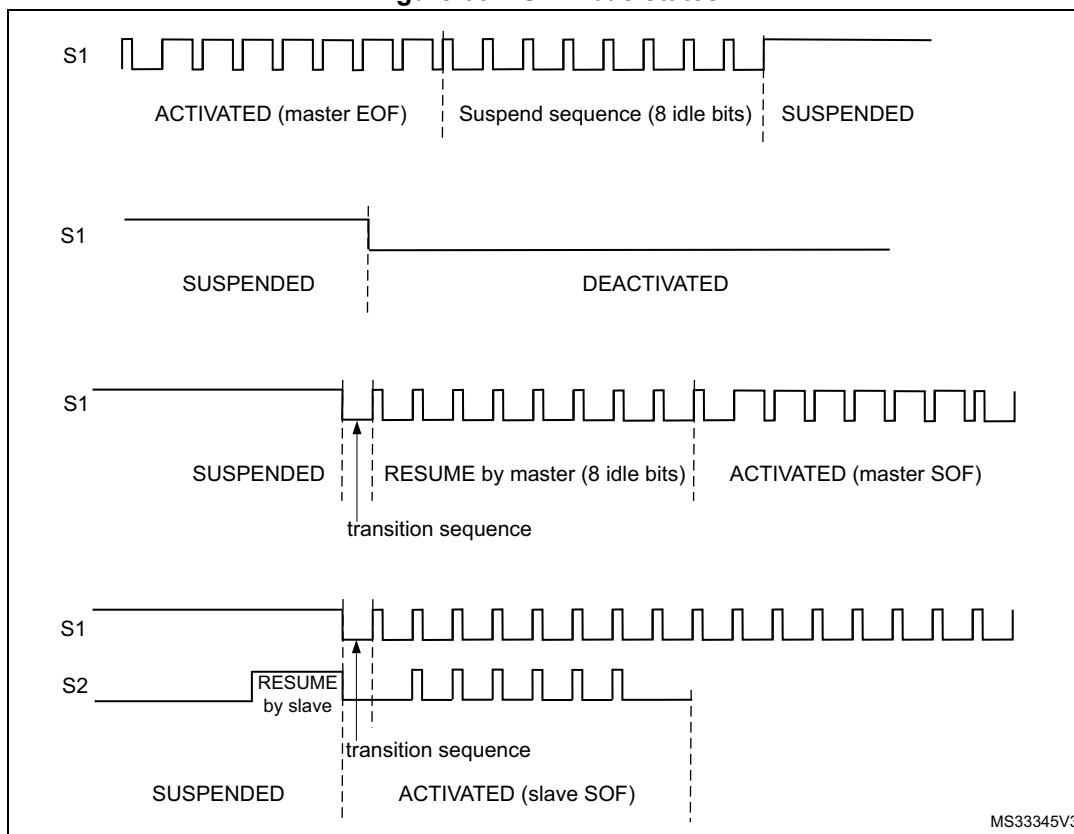

In order to activate SWP again, the software must clear DEACT bit in the SWPMI\_CR register before setting SWPACT bit.

**Deactivate mode**

In order to switch the SWP to the DEACTIVATED mode immediately, ignoring any possible incoming RESUME by slave, the user must clear SWPACT bit in the SWPMI\_CR register.

*Note:* In order to further reduce current consumption, configure the SWPMI\_IO port as output push pull low in GPIO controller and then clear the SWPTEN bit in SWPMI\_CR register (refer to [Section 11: General-purpose I/Os \(GPIO\)](#)).

**Figure 657. SWP bus states**

**58.3.5 SWPMI\_IO (internal transceiver) bypass**

A SWPMI\_IO (transceiver), compliant with ETSI TS 102 613 technical specification, is embedded in the microcontroller. Nevertheless, this is possible to bypass it by setting SWP\_TBYP bit in SWPMI\_OR register. In this case, the SWPMI\_IO is disabled and the SWPMI\_RX, SWPMI\_TX and SWPMI\_SUSPEND signals are available as alternate functions on three GPIOs (refer to “Pinouts and pin description” in product datasheet). This configuration is selected to connect an external transceiver.

*Note:* In SWPMI\_IO bypass mode, SWPTEN bit in SWPMI\_CR register must be kept cleared.

**58.3.6 SWPMI bit rate**

The bit rate must be set in the SWPMI\_BRR register, according to the following formula:

$$F_{SWP} = F_{swpmi\_ker\_ck} / ((BR[7:0]+1) \times 4)$$

*Note:* The maximum bitrate is 2 Mbit/s.

### 58.3.7 SWPMI frame handling

The SWP frame is composed of a Start of frame (SOF), a Payload from 1 to 30 bytes, a 16-bit CRC and an End of frame (EOF) (Refer to [Figure 658: SWP frame structure](#)).

Figure 658. SWP frame structure

The SWPMI embeds one 32-bit data register for transmission (SWPMI\_TDR), and one 32-bit data register for reception (SWPMI\_RDR).

In transmission, the SOF insertion, the CRC calculation and insertion, and the EOF insertion are managed automatically by the SWPMI. The user only has to provide the Payload content and size. A frame transmission starts as soon as data is written into the SWPMI\_TDR register. Dedicated flags indicate an empty transmit data register and a complete frame transmission event.

In reception, the SOF deletion, the CRC calculation and checking, and the EOF deletion are managed automatically by the SWPMI. The user only has to read the Payload content and size. Dedicated flags indicate a full receive data register, a complete frame reception and possibly CRC error events.

The stuffing bits insertion (in transmission) and stuffing bits deletion (in reception) are managed automatically by the SWPMI core. These operations are transparent for the user.

### 58.3.8 Transmission procedure

Before starting any frame transmission, the user must activate the SWP. Refer to [Section 58.3.3: SWP initialization and activation](#).

There are several possible software implementations for a frame transmission: No software buffer mode, Single software buffer mode, and Multi software buffer mode.

The software buffer usage requires the use of a DMA channel to transfer data from the software buffer in the RAM memory to the transmit data register in the SWPMI peripheral.

#### No software buffer mode

This mode does not require the use of DMA. The SWP frame transmission handling is done by polling status flags in the main loop or inside the SWPMI interrupt routine. There is a 32-bit transmit data register (SWPMI\_TDR) in the SWPMI, thus writing to this register will trigger the transmission of up to 4 bytes.

The No software buffer mode is selected by clearing TXDMA bit in the SWPMI\_CR register.

The frame transmission is started by the first write to the SWPMI\_TDR register. The low significant byte of the first 32-bit word (bits [7:0]) written into the SWPMI\_TDR register indicates the number of data bytes in the payload, and the 3 other bytes of this word must

contain the first 3 bytes of the payload (bits [15:8] contain the first byte of the payload, bits [23:16] the second byte and bits [31:24] the third byte). Then, the following writes to the SWPMI\_TDR register will only contain the following payload data bytes, up to 4 for each write.

*Note:* The low significant byte of the first 32-bit word written into the SWPMI\_TDR register is coding the number of data bytes in the payload. This number could be from 1 to 30. Any other value in the low significant byte will be ignored and the transmission will not start.

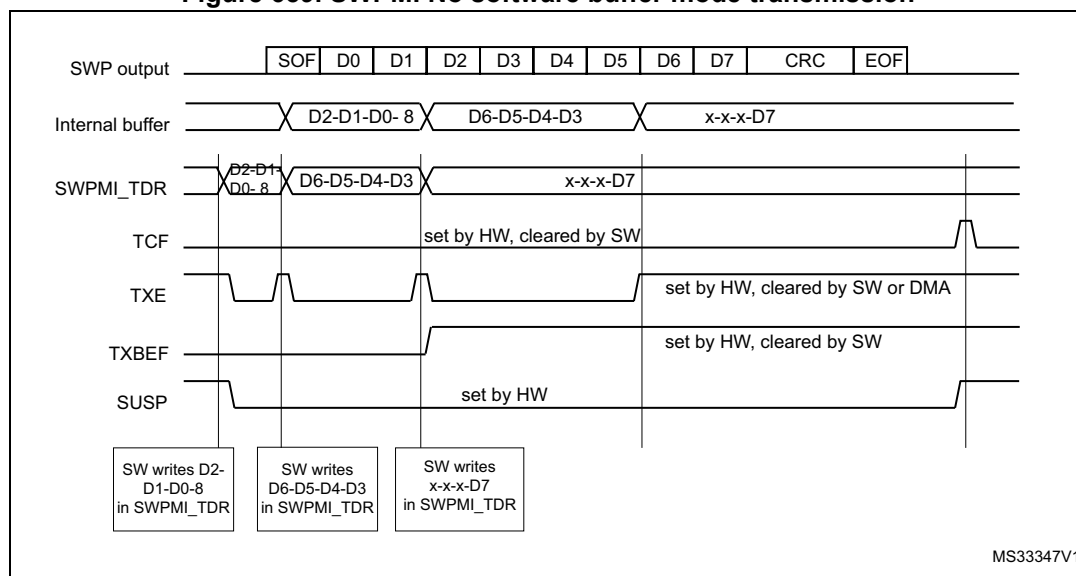

Writing to the SWPMI\_TDR register will induce the following actions:

- Send the transition sequence and 8 idle bits (RESUME by master) if the SWP bus state is SUPENDED (this will not happen if the SWP bus state is already ACTIVATED),
- Send a Start of frame (SOF),
- Send the payload according to the SWPMI\_TRD register content. If the number of bytes in the payload is greater than 3, the SWPMI\_TDR needs to be refilled by software, each time the TXE flag in the SWPMI\_ISR register is set, and as long as the TXBEF flag is not set in the SWPMI\_ISR register,
- Send the 16-bit CRC, automatically calculated by the SWPMI core,
- Send an End of frame (EOF).

The TXE flag is cleared automatically when the software is writing to the SWPMI\_TDR register.

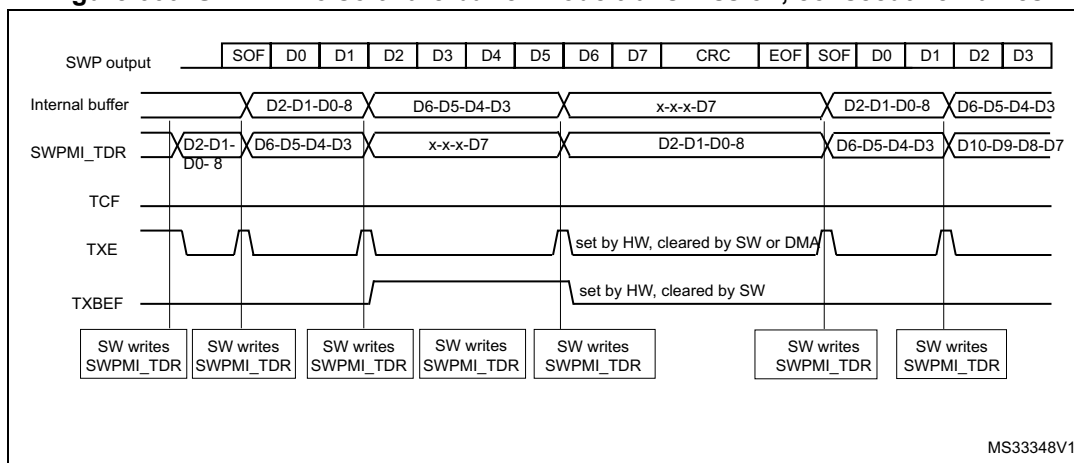

Once the complete frame is sent, provided that no other frame transmission has been requested (i.e. SWPMI\_TDR has not been written again after the TXBEF flag setting), TCF and SUSP flags are set in the SWPMI\_ISR register 7 idle bits after the EOF transmission, and an interrupt is generated if TCIE bit is set in the SWPMI\_IER register (refer to [Figure 659: SWPMI No software buffer mode transmission](#)).

**Figure 659. SWPMI No software buffer mode transmission**

If another frame transmission is requested before the end of the EOF transmission, the TCF flag is not set and the frame will be consecutive to the previous one, with only one idle bit in between (refer to [Figure 660: SWPMI No software buffer mode transmission, consecutive frames](#)).

Figure 660. SWPMI No software buffer mode transmission, consecutive frames

### Single software buffer mode

This mode allows to transmit a complete SWP frame without a CPU intervention, using the DMA. The DMA will refill the 32-bit SWPMI\_TDR register, and the software can poll the end of the frame transmission using the SWPMI\_TXBEF flag.

The Single software buffer mode is selected by setting TXDMA bit and clearing TXMODE bit in the SWPMI\_CR register.

The DMA channel or stream must be configured in following mode (refer to DMA section):

- memory to memory mode disabled,
- memory increment mode enabled,
- memory size set to 32-bit,
- peripheral size set to 32-bit,
- peripheral increment mode disabled,
- circular mode disabled,
- data transfer direction set to read from memory.
- the number of words to be transfered must be set according to the SWP frame length,
- the source address is the SWP frame buffer in RAM,
- the destination address is the SWPMI\_TDR register.

Then the user must:

1. Set TXDMA bit in the SWPMI\_CR register,
2. Set TXBEIE bit in the SWPMI\_IER register,
3. Fill the buffer in the RAM memory (with the number of data bytes in the payload on the least significant byte of the first word),
4. Enable stream or channel in DMA module to start DMA transfer and frame transmission.

A DMA request is issued by SWPMI when TXE flag in SWPMI\_ISR is set. The TXE flag is cleared automatically when the DMA is writing to the SWPMI\_TDR register.

In the SWPMI interrupt routine, the user must check TXBEF bit in the SWPMI\_ISR register. If it is set, and if another frame needs to be transmitted, the user must:

1. Disable stream or channel in DMA module
2. Update the buffer in the RAM memory with the content of the next frame to be sent
3. Configure the total number of words to be transferred in DMA module
4. Enable stream or channel in DMA module to start next frame transmission
5. Set CTXBEF bit in the SWPMI\_ICR register to clear the TXBEF flag

### Multi software buffer mode

This mode allows to work with several frame buffers in the RAM memory, in order to ensure a continuous transmission, keeping a very low CPU load, and allowing more latency for buffer update by software thanks to the DMA. The software can check the DMA counters at any time and update SWP frames accordingly in the RAM memory.

The Multi software buffer mode must be used in combination with DMA in circular mode.

Each transmission buffer in the RAM memory must have a fixed length of eight 32-bit words, whatever the number of bytes in the SWP frame payload. The transmission buffers in the RAM memory must be filled by the software, keeping an offset of 8 between two consecutive ones. The first data byte of the buffer is the number of bytes of the frame payload. See the buffer example in [Figure 661: SWPMI Multi software buffer mode transmission](#)

The Multi software buffer mode is selected by setting both TXDMA and TXMODE bits in SWPMI\_CR register.

For example, in order to work with 4 transmission buffers, the user must configure the DMA as follows:

The DMA channel or stream must be configured in following mode (refer to DMA section):

- memory to memory mode disabled,
- memory increment mode enabled,
- memory size set to 32-bit,
- peripheral size set to 32-bit,
- peripheral increment mode disabled,
- circular mode enabled,
- data transfer direction set to read from memory,
- the number of words to be transferred must be set to 32 (8 words per buffer),
- the source address is the buffer1 in RAM,
- the destination address is the SWPMI\_TDR register.

Then, the user must:

1. Set TXDMA in the SWPMI\_CR register
2. Set TXBEIE in the SWPMI\_IER register
3. Fill buffer1, buffer2, buffer3 and buffer4 in the RAM memory (with the number of data bytes in the payload on the least significant byte of the first word)
4. Enable stream or channel in DMA module to start DMA.

In the SWPMI interrupt routine, the user must check TXBEF bit in the SWPMI\_ISR register. If it is set, the user must set CTXBEF bit in SWPMI\_ICR register to clear TXBEF flag and the user can update buffer1 in the RAM memory.

In the next SWPMI interrupt routine occurrence, the user will update buffer2, and so on.

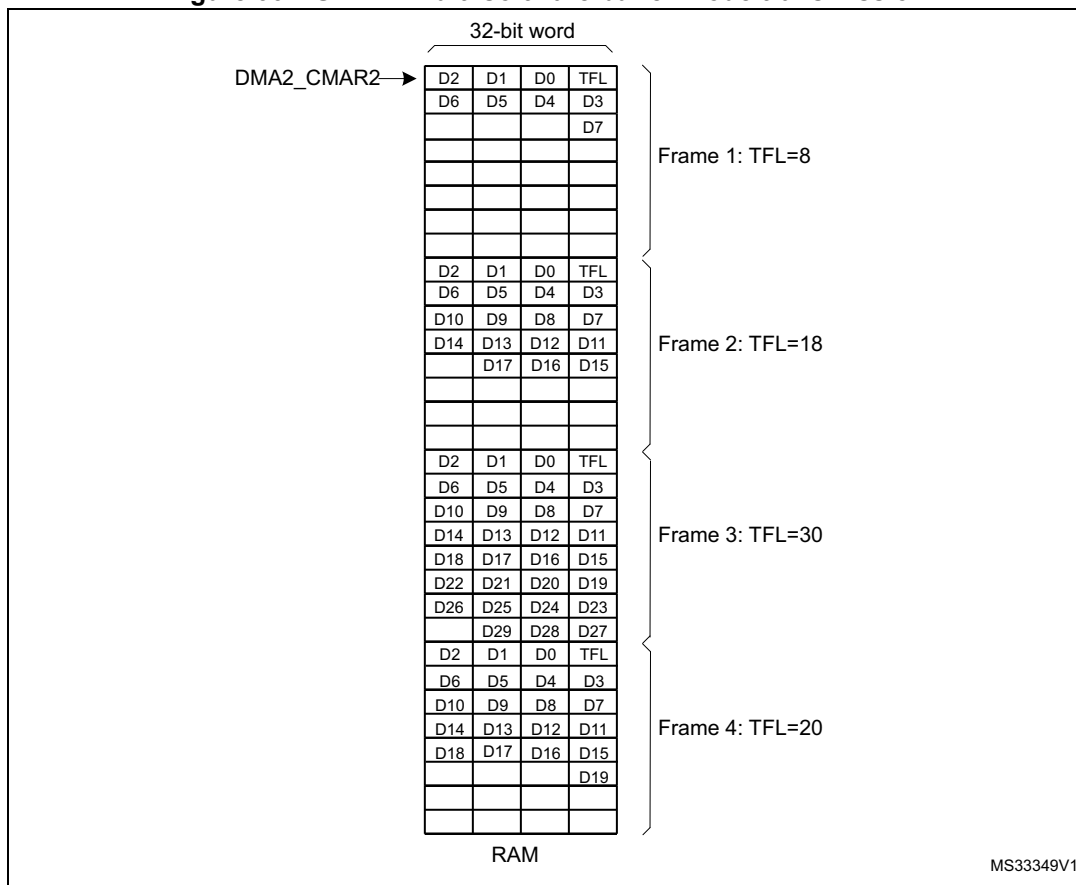

The Software can also read the DMA counter (number of data to transfer) in the DMA registers in order to retrieve the frame which has already been transferred from the RAM memory and transmitted. For example, if the software works with 4 transmission buffers, and if the DMA counter equals 17, it means that two buffers are ready for updating in the RAM area. This is useful in case several frames are sent before the software can handle the SWPMI interrupt. If this happens, the software will have to update several buffers.

When there are no more frames to transmit, the user must disable the circular mode in the DMA module. The transmission will stop at the end of the buffer4 transmission.

If the transmission needs to stop before (for example at the end of buffer2), the user must set the low significant byte of the first word to 0 in buffer3 and buffer4.

TXDMA bit in the SWPMI\_CR register will be cleared by hardware as soon as the number of data bytes in the payload is read as 0 in the least significant byte of the first word.

Figure 661. SWPMI Multi software buffer mode transmission

### 58.3.9 Reception procedure

Before starting any frame reception, the user must activate the SWP (refer to [Section 58.3.3: SWP initialization and activation](#)).

Once SWPACT bit is set in the SWPMI\_CR register, a RESUME from slave state sets the SRF flag in the SWPMI\_ISR register and automatically enables the SWPMI for the frame reception.

If the SWP bus is already in the ACTIVATED state (for example because a frame transmission is ongoing), the SWPMI core does not need any RESUME by slave state, and the reception can take place immediately.

There are several possible software implementations for a frame reception:

- No software buffer mode,
- Single software buffer mode,
- Multi software buffer mode.

The software buffer usage requires the use of a DMA channel to transfer data from the receive data register in the SWPMI peripheral to the software buffer in the RAM memory.

#### No software buffer mode

This mode does not require the use of DMA. The SWP frame reception handling is done by polling status flags in the main loop or inside the SWPMI interrupt routine. There is a 32-bit receive data register (SWPMI\_RDR) in the SWPMI, allowing to receive up to 4 bytes before reading this register.

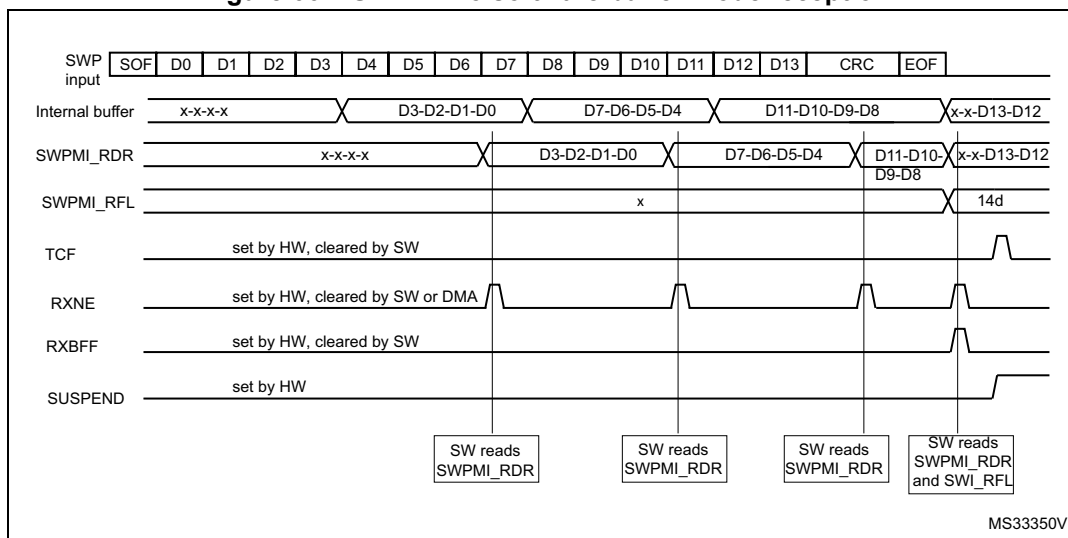

The No software buffer mode is selected by resetting RXDMA bit in the SWPMI\_CR register.

Once a Start of frame (SOF) is received, the following bytes (payload) are stored in the SWPMI\_RDR register. Once the SWPMI\_RDR is full, the RXNE flag is set in SWPMI\_ISR and an interrupt is generated if RIE bit is set in SWPMI\_IER register. The user can read the SWPMI\_RDR register and the RXNE flag is cleared automatically when the software is reading the SWPMI\_RDR register.

Once the complete frame has been received, including the CRC and the End of frame (EOF), both RXNE and RXBFF flags are set in the SWPMI\_ISR register. The user must read the last byte(s) of the payload in the SWPMI\_RDR register and set CRXBFF flag in SWPMI\_ICR in order to clear the RXBFF flag. The number of data bytes in the payload is available in the SWPMI\_RFL register. Again, the RXNE flag is reset automatically when the software is reading the SWPMI\_RDR register (refer to [Figure 662: SWPMI No software buffer mode reception](#)).

Reading the SWPMI\_RDR register while RXNE is cleared will return 0.

Figure 662. SWPMI No software buffer mode reception

**Single software buffer mode**

This mode allows to receive a complete SWP frame without any CPU intervention using the DMA. The DMA transfers received data from the 32-bit SWPMI\_RDR register to the RAM memory, and the software can poll the end of the frame reception using the SWPMI\_RBFF flag.

The Single software buffer mode is selected by setting RXDMA bit and clearing RXMODE bit in the SWPMI\_CR register.

The DMA must be configured as follows:

The DMA channel or stream must be configured in following mode (refer to DMA section):

- memory to memory mode disabled,
- memory increment mode enabled,
- memory size set to 32-bit,
- peripheral size set to 32-bit,
- peripheral increment mode disabled,
- circular mode disabled,
- data transfer direction set to read from peripheral,
- the number of words to be transfered must be set to 8,
- the source address is the SWPMI\_RDR register,
- the destination address is the SWP frame buffer in RAM.

Then the user must:

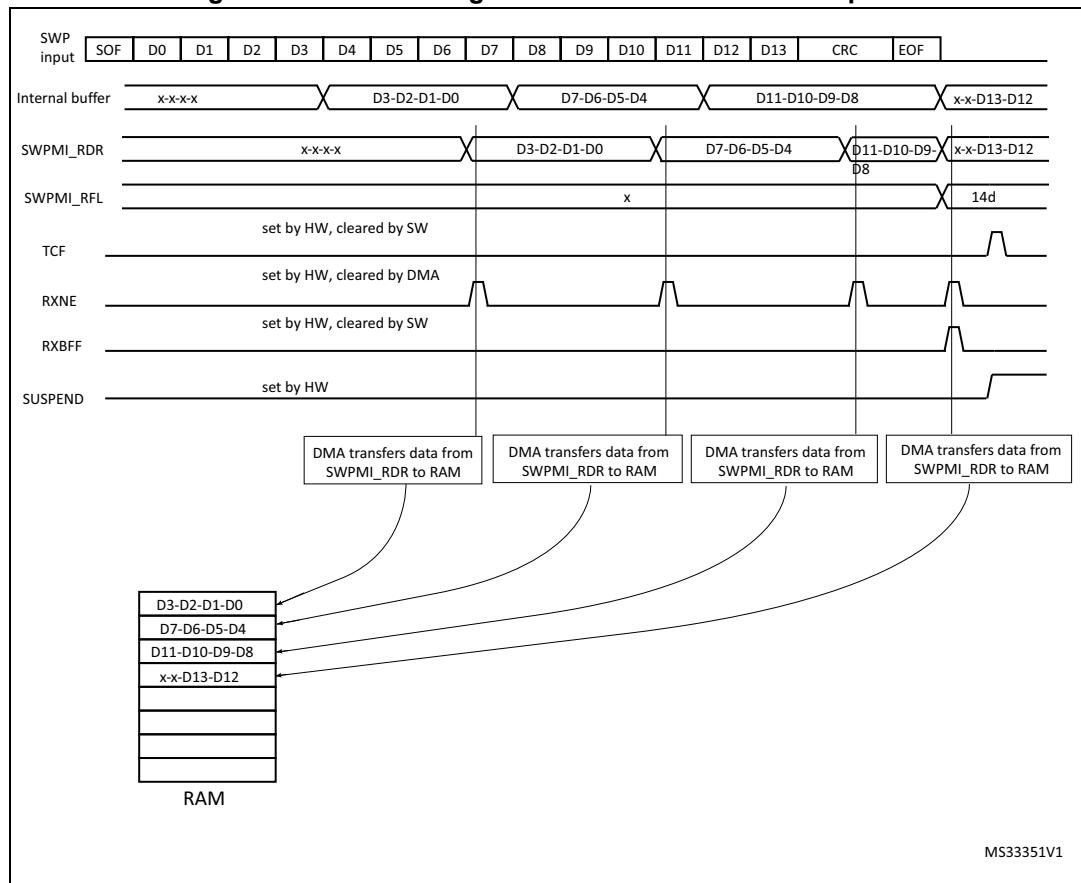

1. Set RXDMA bit in the SWPMI\_CR register
2. Set RXBFIE bit in the SWPMI\_IER register
3. Enable stream or channel in DMA module.

A DMA request is issued by SWPMI when RXNE flag is set in SWPMI\_ISR. The RXNE flag is cleared automatically when the DMA is reading the SWPMI\_RDR register.

In the SWPMI interrupt routine, the user must check RXBFF bit in the SWPMI\_ISR register. If it is set, the user must:

1. Disable stream or channel in DMA module
2. Read the number of bytes in the received frame payload in the SWPMI\_RFL register
3. Read the frame payload in the RAM buffer
4. Enable stream or channel in DMA module
5. Set CRXBFF bit in the SWPMI\_ICR register to clear RXBFF flag (refer to [Figure 663: SWPMI single software buffer mode reception](#)).

**Figure 663. SWPMI single software buffer mode reception**

**Multi software buffer mode**

This mode allows to work with several frame buffers in the RAM memory, in order to ensure a continuous reception, keeping a very low CPU load, using the DMA. The frame payloads are stored in the RAM memory, together with the frame status flags. The software can check the DMA counters and status flags at any time to handle the received SWP frames in the RAM memory.

The Multi software buffer mode must be used in combination with the DMA in circular mode.

The Multi software buffer mode is selected by setting both RXDMA and RXMODE bits in SWPMI\_CR register.

In order to work with  $n$  reception buffers in RAM, the DMA channel or stream must be configured in following mode (refer to DMA section):

- memory to memory mode disabled,
- memory increment mode enabled,
- memory size set to 32-bit,
- peripheral size set to 32-bit,
- peripheral increment mode disabled,
- circular mode enabled,
- data transfer direction set to read from peripheral,
- the number of words to be transferred must be set to  $8 \times n$  (8 words per buffer),
- the source address is the SWPMI\_TDR register,
- the destination address is the buffer1 address in RAM

Then the user must:

1. Set RXDMA in the SWPMI\_CR register
2. Set RXBFIE in the SWPMI\_IER register
3. Enable stream or channel in the DMA module.

In the SWPMI interrupt routine, the user must check RXBFF in the SWPMI\_ISR register. If it is set, the user must set CRXBFF bit in the SWPMI\_ICR register to clear RXBFF flag and the user can read the first frame payload received in the first buffer (at the RAM address set in DMA2\_CMAR1).

The number of data bytes in the payload is available in bits [23:16] of the last 8th word.

In the next SWPMI interrupt routine occurrence, the user will read the second frame received in the second buffer (address set in DMA2\_CMAR1 + 8), and so on (refer to [Figure 664: SWPMI Multi software buffer mode reception](#)).

In case the application software cannot ensure to handle the SWPMI interrupt before the next frame reception, each buffer status is available in the most significant byte of the 8th buffer word:

- The CRC error flag (equivalent to RXBERF flag in the SWPMI\_ISR register) is available in bit 24 of the 8th word. Refer to [Section 58.3.10: Error management](#) for an CRC error description.
- The receive overrun flag (equivalent to RXOVRF flag in the SWPMI\_ISR register) is available in bit 25 of the 8th word. Refer to [Section 58.3.10: Error management](#) for an overrun error description.
- The receive buffer full flag (equivalent to RXBFF flag in the SWPMI\_ISR register) is available in bit 26 of the 8th word.

In case of a CRC error, both RXBFF and RXBERF flags are set, thus bit 24 and bit 26 are set.

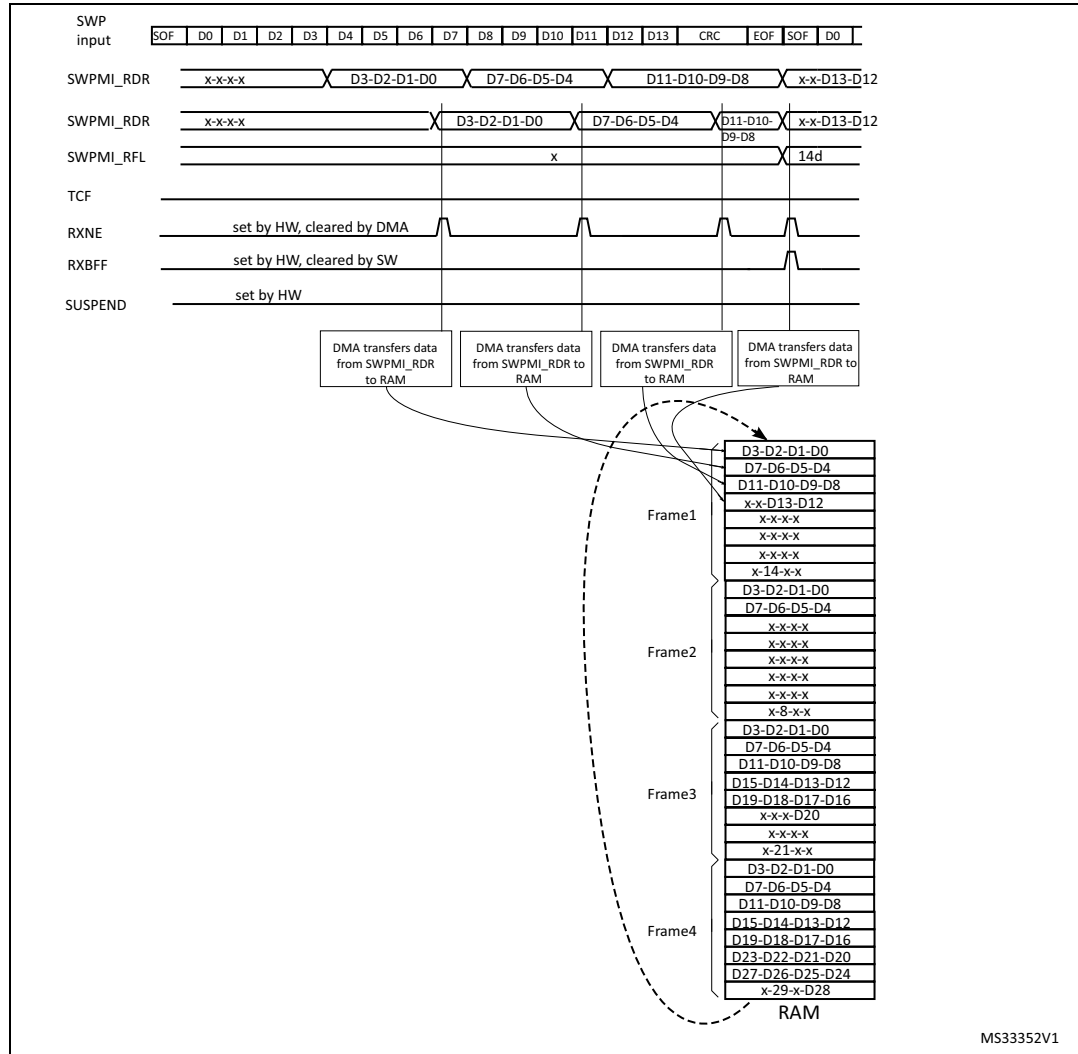

In case of an overrun, an overrun flag is set, thus bit 25 is set. The receive buffer full flag is set only in case of an overrun during the last word reception; then, both bit 25 and bit 26 are set for the current and the next frame reception.

The software can also read the DMA counter (number of data to transfer) in the DMA registers in order to retrieve the frame which has already been received and transferred into the RAM memory through DMA. For example, if the software works with 4 reception buffers,

and if the DMA counter equals 17, it means that two buffers are ready for reading in the RAM area.

In Multi software buffer reception mode, if the software is reading bits 24, 25 and 26 of the 8th word, it does not need to clear RXBERF, RXOVRF and RXBFF flags after each frame reception.

**Figure 664. SWPMI Multi software buffer mode reception**

### 58.3.10 Error management

#### Underrun during payload transmission

During the transmission of the frame payload, a transmit underrun is indicated by the TXUNRF flag in the SWPMI\_ISR register. An interrupt is generated if TXBUNREIE bit is set in the SWPMI\_IER register.

If a transmit underrun occurs, the SWPMI stops the payload transmission and sends a corrupted CRC (the first bit of the first CRC byte sent is inverted), followed by an EOF. If DMA is used, TXDMA bit in the SWPMI\_CR register is automatically cleared.

Any further write to the SWPMI\_TDR register while TXUNRF is set will be ignored. The user must set CTXUNRF bit in the SWPMI\_ICR register to clear TXUNRF flag.

### Overrun during payload reception

During the reception of the frame payload, a receive overrun is indicated by RXOVRF flag in the SWPMI\_ISR register. If a receive overrun occurs, the SWPMI does not update SWPMI\_RDR with the incoming data. The incoming data will be lost.

The reception carries on up to the EOF and, if the overrun condition disappears, the RXBFF flag is set. When RXBFF flag is set, the user can check the RXOVRF flag. The user must set CRXOVRF bit in the SWPMI\_ICR register to clear RXBOVRF flag.

If the user wants to detect the overrun immediately, RXBOVREIE bit in the SWPMI\_IER register can be set in order to generate an interrupt as soon as the overrun occurs.

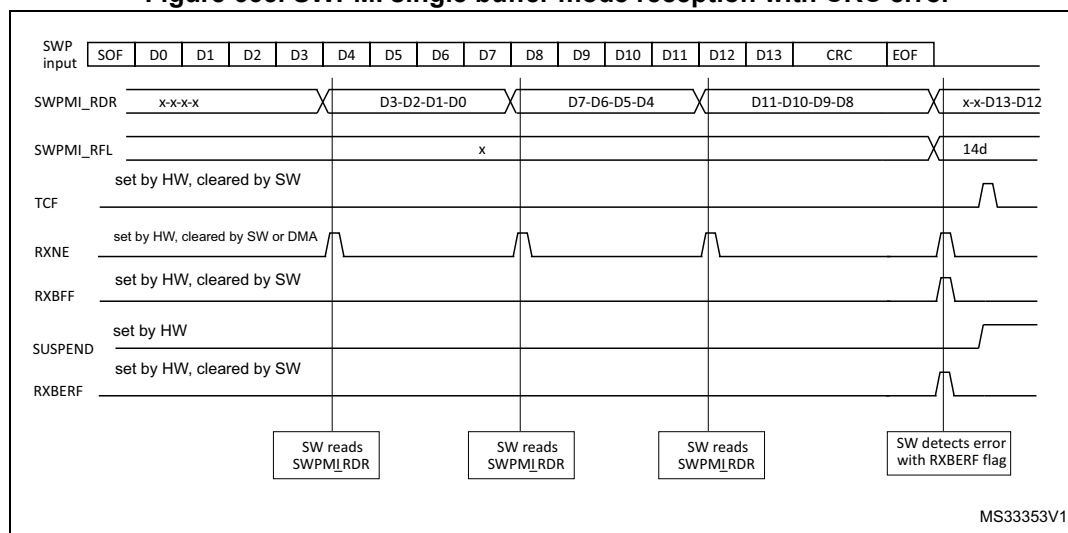

The RXOVRF flag is set at the same time as the RXNE flag, two SWPMI\_RDR reads after the overrun event occurred. It indicates that at least one received byte was lost, and the loaded word in SWPMI\_RDR contains the bytes received just before the overrun.

In Multi software buffer mode, if RXOVRF flag is set for the last word of the received frame, then the overrun bit (bit 25 of the 8th word) is set for both the current and the next frame.

### CRC error during payload reception

Once the two CRC bytes have been received, if the CRC is wrong, the RXBERF flag in the SWPMI\_ISR register is set after the EOF reception. An interrupt is generated if RXBEIE bit in the SWPMI\_IER register is set (refer to [Figure 665: SWPMI single buffer mode reception with CRC error](#)). The user must set CRXBERF bit in SWPMI\_ICR to clear RXBERF flag.

Figure 665. SWPMI single buffer mode reception with CRC error

### Missing or corrupted stuffing bit during payload reception

When a stuffing bit is missing or is corrupted in the payload, RXBERF and RXBFF flags are set in SWPMI\_ISR after the EOF reception.

### Corrupted EOF reception

Once an SOF has been received, the SWPMI accumulates the received bytes until the reception of an EOF (ignoring any possible SOF). Once an EOF has been received, the SWPMI is ready to start a new frame reception and waits for an SOF.

In case of a corrupted EOF, RXBERF and RXBFF flags will be set in the SWPMI\_ISR register after the next EOF reception.

*Note:* In case of a corrupted EOF reception, the payload reception carries on, thus the number of bytes in the payload might get the value 31 if the number of received bytes is greater than 30. The number of bytes in the payload is read in the SWPMI\_RFL register or in bits [23:16] of the 8th word of the buffer in the RAM memory, depending on the operating mode.

#### 58.3.11 Loopback mode

The loopback mode can be used for test purposes. The user must set LPBK bit in the SWPMI\_CR register in order to enable the loopback mode.

When the loopback mode is enabled, SWPMI\_TX and SWPMI\_RX signals are connected together. As a consequence, all frames sent by the SWPMI will be received back.

## 58.4 SWPMI low-power modes

**Table 432. Effect of low-power modes on SWPMI**

Mode	Description
Sleep	No effect. SWPMI interrupts cause the device to exit the Sleep mode.
Stop	A RESUME from SUSPENDED mode issued by the slave can wake up the device from Stop mode if the swpmi_ker_ck is HSI (refer to <a href="#">Section 58.3.1: SWPMI block diagram</a> ).
Standby	The SWPMI is stopped.

## 58.5 SWPMI interrupts

All SWPMI interrupts are connected to the NVIC.

To enable the SWPMI interrupt, the following sequence is required:

1. Configure and enable the SWPMI interrupt channel in the NVIC
2. Configure the SWPMI to generate SWPMI interrupts (refer to the SWPMI\_IER register).

**Table 433. Interrupt control bits**

Interrupt event	Event flag	Enable control bit	Exit the Sleep mode	Exit the Stop mode	Exit the Standby mode
Receive buffer full	RXBFF	RXBFIE	yes	no	no
Transmit buffer empty	TXBEF	TXBEIE	yes	no	no
Receive buffer error (CRC error)	RXBERF	RXBEIE	yes	no	no
Receive buffer overrun	RXOVRF	RXBOVEREIE	yes	no	no
Transmit buffer underrun	TXUNRF	TXBUNREIE	yes	no	no
Receive data register not empty	RXNE	RIE	yes	no	no
Transmit data register full	TXE	TIE	yes	no	no
Transfer complete flag	TCF	TCIE	yes	no	no
Slave resume flag	SRF	SRIE	yes	yes <sup>(1)</sup>	no
Transceiver ready flag	RDYF	RDYIE	yes	no	no

1. If HSI is selected for `swpmi_ker_ck`.

## 58.6 SWPMI registers

Refer to [Section 1.2](#) of the reference manual for a list of abbreviations used in register descriptions.

The peripheral registers can only be accessed by words (32-bit).

### 58.6.1 SWPMI configuration/control register (SWPMI\_CR)

Address offset: 0x00

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	SWPT EN	DEACT	Res.	Res.	Res.	Res.	SWP ACT	LPBK	TXMOD E	RXMO DE	TXDMA	RXDMA
				rw	rw					rw	rw	rw	rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **SWPTEN**: Single wire protocol master transceiver enable

This bit is used to enable the transceiver and control the SWPMI\_IO with SWPMI (refer to [Section 58.3.3: SWP initialization and activation](#)).

0: SWPMI\_IO pin is controlled by GPIO controller

1: SWPMI\_IO transceiver is controlled by SWPMI

Bit 10 **DEACT**: Single wire protocol master interface deactivate

This bit is used to request the SWP DEACTIVATED state. Setting this bit has the same effect as clearing the SWPACT, except that a possible incoming RESUME by slave will keep the SWP in the ACTIVATED state.

Bits 9:6 Reserved, must be kept at reset value.

Bit 5 **SWPACT**: Single wire protocol master interface activate

This bit is used to activate the SWP bus (refer to [Section 58.3.3: SWP initialization and activation](#)).

0: SWPMI\_IO is pulled down to ground, SWP bus is switched to DEACTIVATED state

1: SWPMI\_IO is released, SWP bus is switched to SUSPENDED state

To be able to set SWPACT bit, DEACT bit must be have been cleared previously.

Bit 4 **LPBK**: Loopback mode enable

This bit is used to enable the loopback mode

0: Loopback mode is disabled

1: Loopback mode is enabled

*Note: This bit cannot be written while SWPACT bit is set.*

Bit 3 **TXMODE**: Transmission buffering mode

This bit is used to choose the transmission buffering mode. This bit is relevant only when TXDMA bit is set (refer to [Table 434: Buffer modes selection for transmission/reception](#)).

0: SWPMI is configured in Single software buffer mode for transmission

1: SWPMI is configured in Multi software buffer mode for transmission.

*Note: This bit cannot be written while SWPACT bit is set.*

Bit 2 **RXMODE**: Reception buffering mode

This bit is used to choose the reception buffering mode. This bit is relevant only when TXDMA bit is set (refer to [Table 434: Buffer modes selection for transmission/reception](#)).

- 0: SWPMI is configured in Single software buffer mode for reception
- 1: SWPMI is configured in Multi software buffer mode for reception.

*Note: This bit cannot be written while SWPACT bit is set.*

Bit 1 **TXDMA**: Transmission DMA enable

This bit is used to enable the DMA mode in transmission

- 0: DMA is disabled for transmission
- 1: DMA is enabled for transmission

*Note: TXDMA is automatically cleared if the payload size of the transmitted frame is given as 0x00 (in the least significant byte of TDR for the first word of a frame). TXDMA is also automatically cleared on underrun events (when TXUNRF flag is set in the SWP\_ISR register)*

Bit 0 **RXDMA**: Reception DMA enable

This bit is used to enable the DMA mode in reception

- 0: DMA is disabled for reception
- 1: DMA is enabled for reception

**Table 434. Buffer modes selection for transmission/reception**

Buffer mode	No software buffer	Single software buffer	Multi software buffer
RXMODE/TXMODE	x	0	1
RXDMA/TXDMA	0	1	1

### 58.6.2 SWPMI Bitrate register (SWPMI\_BRR)

Address offset: 0x04

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BR[7:0]							
								r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **BR[7:0]**: Bitrate prescaler

This field must be programmed to set SWP bus bitrate, taking into account the  $F_{swpmi\_ker\_ck}$  programmed in the RCC (Reset and Clock Control), according to the following formula:

$$F_{SWP} = F_{swpmi\_ker\_ck} / ((BR[7:0]+1) \times 4)$$

*Note: The programmed bitrate must stay within the following range: from 100 kbit/s up to 2 Mbit/s.*

*BR[7:0] cannot be written while SWPACT bit is set in the SWPMI\_CR register.*

### 58.6.3 SWPMI Interrupt and Status register (SWPMI\_ISR)

Address offset: 0x0C

Reset value: 0x0000 02C2

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	RDYF	DEACT F	SUSP	SRF	TCF	TXE	RXNE	TXUNR F	RXOVR F	RXBER F	TXBEF	RXBFF
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

**Bit 11 RDYF:** transceiver ready flag

This bit is set by hardware as soon as transceiver is ready. After setting the SWPTEN bit in SWPMI\_CR register to enable the SWPMI\_IO transceiver, software must wait for this flag to be set before setting the SWPACT bit to activate the SWP bus.

- 0: transceiver not ready
- 1: transceiver ready

**Bit 10 DEACTF:** DEACTIVATED flag

This bit is a status flag, acknowledging the request to enter the DEACTIVATED mode.

- 0: SWP bus is in ACTIVATED or SUSPENDED state
- 1: SWP bus is in DEACTIVATED state

If a RESUME by slave state is detected by the SWPMI while DEACT bit is set by software, the SRF flag will be set, DEACTF will not be set and SWP will move in ACTIVATED state.

**Bit 9 SUSP:** SUSPEND flag

This bit is a status flag, reporting the SWP bus state

- 0: SWP bus is in ACTIVATED state
- 1: SWP bus is in SUSPENDED or DEACTIVATED state

**Bit 8 SRF:** Slave resume flag

This bit is set by hardware to indicate a RESUME by slave detection. It is cleared by software, writing 1 to CSRF bit in the SWPMI\_ICR register.

- 0: No Resume by slave state detected
- 1: A Resume by slave state has been detected during the SWP bus SUSPENDED state

**Bit 7 TCF:** Transfer complete flag

This flag is set by hardware as soon as both transmission and reception are completed and SWP is switched to the SUSPENDED state. It is cleared by software, writing 1 to CTCF bit in the SWPMI\_ICR register.

- 0: Transmission or reception is not completed
- 1: Both transmission and reception are completed and SWP is switched to the SUSPENDED state

**Bit 6 TXE:** Transmit data register empty

This flag indicates the transmit data register status

- 0: Data written in transmit data register SWPMI\_TDR is not transmitted yet
- 1: Data written in transmit data register SWPMI\_TDR has been transmitted and SWPMI\_TDR can be written to again

- Bit 5 **RXNE**: Receive data register not empty  
 This flag indicates the receive data register status  
 0: Data is not received in the SWPMI\_RDR register  
 1: Received data is ready to be read in the SWPMI\_RDR register
  
- Bit 4 **TXUNRF**: Transmit underrun error flag  
 This flag is set by hardware to indicate an underrun during the payload transmission i.e. SWPMI\_TDR has not been written in time by the software or the DMA. It is cleared by software, writing 1 to the CTXUNRF bit in the SWPMI\_ICR register.  
 0: No underrun error in transmission  
 1: Underrun error in transmission detected
  
- Bit 3 **RXOVRF**: Receive overrun error flag  
 This flag is set by hardware to indicate an overrun during the payload reception, i.e. SWPMI\_RDR has not be read in time by the software or the DMA. It is cleared by software, writing 1 to CRXOVRF bit in the SWPMI\_ICR register.  
 0: No overrun in reception  
 1: Overrun in reception detected
  
- Bit 2 **RXBERF**: Receive CRC error flag  
 This flag is set by hardware to indicate a CRC error in the received frame. It is set synchronously with RXBFF flag. It is cleared by software, writing 1 to CRXBERF bit in the SWPMI\_ICR register.  
 0: No CRC error in reception  
 1: CRC error in reception detected
  
- Bit 1 **TXBEF**: Transmit buffer empty flag  
 This flag is set by hardware to indicate that no more SWPMI\_TDR update is required to complete the current frame transmission. It is cleared by software, writing 1 to CTXBEF bit in the SWPMI\_ICR register.  
 0: Frame transmission buffer no yet emptied  
 1: Frame transmission buffer has been emptied
  
- Bit 0 **RXBFF**: Receive buffer full flag  
 This flag is set by hardware when the final word for the frame under reception is available in SWPMI\_RDR. It is cleared by software, writing 1 to CRXBFF bit in the SWPMI\_ICR register.  
 0: The last word of the frame under reception has not yet arrived in SWPMI\_RDR  
 1: The last word of the frame under reception has arrived in SWPMI\_RDR

### 58.6.4 SWPMI Interrupt Flag Clear register (SWPMI\_ICR)

Address offset: 0x10

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CRDY F	Res.	Res.	CSRF	CTCF	Res.	Res.	CTXUN RF	CRXOV RF	CRXBE RF	CTXBE F	CRXBF F
				rc_w1			rc_w1	rc_w1			rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **CRDYF**: Clear transceiver ready flag  
 Writing 1 to this bit clears the RDYF flag in the SWPMI\_ISR register  
 Writing 0 to this bit does not have any effect

Bits 10:9 Reserved, must be kept at reset value.

Bit 8 **CSRF**: Clear slave resume flag  
 Writing 1 to this bit clears the SRF flag in the SWPMI\_ISR register  
 Writing 0 to this bit does not have any effect

Bit 7 **CTCF**: Clear transfer complete flag  
 Writing 1 to this bit clears the TCF flag in the SWPMI\_ISR register  
 Writing 0 to this bit does not have any effect

Bits 6:5 Reserved, must be kept at reset value.

Bit 4 **CTXUNRF**: Clear transmit underrun error flag  
 Writing 1 to this bit clears the TXUNRF flag in the SWPMI\_ISR register  
 Writing 0 to this bit does not have any effect

Bit 3 **CRXOVRF**: Clear receive overrun error flag  
 Writing 1 to this bit clears the RXBOCREF flag in the SWPMI\_ISR register  
 Writing 0 to this bit does not have any effect

Bit 2 **CRXBERF**: Clear receive CRC error flag  
 Writing 1 to this bit clears the RXBERF flag in the SWPMI\_ISR register  
 Writing 0 to this bit does not have any effect

Bit 1 **CTXBEF**: Clear transmit buffer empty flag  
 Writing 1 to this bit clears the TXBEF flag in the SWPMI\_ISR register  
 Writing 0 to this bit does not have any effect

Bit 0 **CRXBFF**: Clear receive buffer full flag  
 Writing 1 to this bit clears the RXBFF flag in the SWPMI\_ISR register  
 Writing 0 to this bit does not have any effect

### 58.6.5 SWPMI Interrupt Enable register (SMPMI\_IER)

Address offset: 0x14

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	RDYIE	Res.	Res.	SRIE	TCIE	TIE	RIE	TXUNR EIE	RXOVR EIE	RXBE IE	TXBE IE	RXBFIE
				rw			rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **RDYIE**: Transceiver ready interrupt enable

0: Interrupt is inhibited

1: A SWPMI interrupt is generated whenever RDYF flag is set in the SWPMI\_ISR register

Bits 10:9 Reserved, must be kept at reset value.

Bit 8 **SRIE**: Slave resume interrupt enable

0: Interrupt is inhibited

1: An SWPMI interrupt is generated whenever SRF flag is set in the SWPMI\_ISR register

Bit 7 **TCIE**: Transmit complete interrupt enable

0: Interrupt is inhibited

1: An SWPMI interrupt is generated whenever TCF flag is set in the SWPMI\_ISR register

Bit 6 **TIE**: Transmit interrupt enable

0: Interrupt is inhibited

1: An SWPMI interrupt is generated whenever TXE flag is set in the SWPMI\_ISR register

Bit 5 **RIE**: Receive interrupt enable

0: Interrupt is inhibited

1: An SWPMI interrupt is generated whenever RXNE flag is set in the SWPMI\_ISR register

Bit 4 **TXUNREIE**: Transmit underrun error interrupt enable

0: Interrupt is inhibited

1: An SWPMI interrupt is generated whenever TXBUNRF flag is set in the SWPMI\_ISR register

Bit 3 **RXOVREIE**: Receive overrun error interrupt enable

0: Interrupt is inhibited

1: An SWPMI interrupt is generated whenever RXBOVRF flag is set in the SWPMI\_ISR register

Bit 2 **RXBEIE**: Receive CRC error interrupt enable

0: Interrupt is inhibited

1: An SWPMI interrupt is generated whenever RXBERF flag is set in the SWPMI\_ISR register

Bit 1 **TXBEIE**: Transmit buffer empty interrupt enable

0: Interrupt is inhibited

1: An SWPMI interrupt is generated whenever TXBEF flag is set in the SWPMI\_ISR register

Bit 0 **RXBFIE**: Receive buffer full interrupt enable

0: Interrupt is inhibited

1: An SWPMI interrupt is generated whenever RXBFF flag is set in the SWPMI\_ISR register

### 58.6.6 SWPMI Receive Frame Length register (SWPMI\_RFL)

Address offset: 0x18

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RFL[4:0]				
											r	r	r	r	r

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **RFL[4:0]**: Receive frame length

RFL[4:0] is the number of data bytes in the payload of the received frame. The two least significant bits RFL[1:0] give the number of relevant bytes for the last SWPMI\_RDR register read.

### 58.6.7 SWPMI Transmit data register (SWPMI\_TDR)

Address offset: 0x1C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TD[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TD[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **TD[31:0]**: Transmit data

Contains the data to be transmitted.

Writing to this register triggers the SOF transmission or the next payload data transmission, and clears the TXE flag.

### 58.6.8 SWPMI Receive data register (SWPMI\_RDR)

Address offset: 0x20

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RD[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RD[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RD[31:0]**: received data  
 Contains the received data  
 Reading this register is clearing the RXNE flag.

**58.6.9 SWPMI Option register (SWPMI\_OR)**

Address offset: 0x24

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWP_CLASS	SWP_TBYP
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **SWP\_CLASS**: SWP class selection

This bit is used to select the SWP class (refer to [Section 58.3.3: SWP initialization and activation](#)).

- 0: Class C: SWPMI\_IO uses directly VDD voltage to operate in class C.  
 This configuration must be selected when VDD is in the range [1.62 V to 1.98 V]
- 1: Class B: SWPMI\_IO uses an internal voltage regulator to operate in class B.  
 This configuration must be selected when VDD is in the range [2.70 V to 3.30 V]

Bit 0 **SWP\_TBYP**: SWP transceiver bypass

This bit is used to bypass the internal transceiver (SWPMI\_IO), and connect an external transceiver.

- 0: Internal transceiver is enabled. The external interface for SWPMI is SWPMI\_IO (SWPMI\_RX, SWPMI\_TX and SWPMI\_SUSPEND signals are not available on GPIOs)
- 1: Internal transceiver is disabled. SWPMI\_RX, SWPMI\_TX and SWPMI\_SUSPEND signals are available as alternate function on GPIOs. This configuration is selected to connect an external transceiver

58.6.10 SWPMI register map and reset value table

Table 435. SWPMI register map and reset values

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Refer to [Section 2.3 on page 129](#) for the register boundary addresses.

## 59 Management data input/output (MDIOS)

### 59.1 MDIOS introduction

An MDIO bus can be useful in systems where a master chip needs to manage (configure and get status data from) one or multiple slave chips. The bus protocol uses only two signals:

- MDC: the management data clock
- MDIO: the data line carrying the opcode (write or read), the slave (port) address, the MDIOS register address, and the data

In each transaction, the master either reads the contents of an MDIOS register in one of its slaves, or it writes data to an MDIOS register in one of its slaves.

The MDIOS peripheral serves as a slave interface to an MDIO bus. An MDIO master can use the MDC/MDIO lines to write and read 32 16-bit MDIOS registers which are held in the . These MDIOS registers are managed by the firmware, thus allowing the MDIO master to configure the application running on the STM32 and get status information from it.

The MDIOS can operate in Stop mode, optionally waking up the STM32 if the MDIO master performs a read or a write to one of its MDIOS registers.

### 59.2 MDIOS main features

The MDIOS includes the following features:

- 32 MDIOS registers addresses, each of which is managed using separate input and output data registers:
  - 32 x 16-bit firmware read/write, MDIOS read-only output data registers
  - 32 x 16-bit firmware read-only, MDIOS write-only input data registers
- Configurable slave (port) address
- Independently maskable interrupts/events:
  - MDIOS register write
  - MDIOS register read
  - MDIOS protocol error
- Able to operate in and wake up from Stop mode

### 59.3 MDIOS functional description

#### 59.3.1 MDIOS block diagram

Figure 666. MDIOS block diagram

MSv41964V1

#### 59.3.2 MDIOS pins and internal signals

Table 436 lists the MDIOS inputs and output signals connected to package pins or balls, while Table 437 shows the internal PWR signals.

Table 436. MDIOS input/output signals connected to package pins or balls

Signal name	Signal type	Description
MDIOS_MDC	Digital input	MDIO master clock
MDIOS_MDIO	Digital input/output	MDIO signal (opcode, address, input/output data)

Table 437. MDIOS internal input/output signals

Signal name	Signal type	Description
mdios_wkup	Digital output	MDIOS wakeup signal
mdios_it	Digital output	MDIOS interrupt signal
mdios_pclk	Digital input	APB clock

#### 59.3.3 MDIOS protocol

The MDIOS protocol uses two signals:

1. MDIOS\_MDC: the clock, always driven by the master
2. MDIOS\_MDIO: signal carrying the opcode, address, and bidirectional data

Each transaction is performed using a “frame”. Each frame contains 32 bits: 14 control bits, 2 turnaround bits, and then 16 data bits, each passed serially.

- 14 control bits, driven by the master
  - 2 start bits: always 01
  - 2 opcode bits: read = 10, write = 01
  - 5 port address bits, indicating which slave device is being addressed
  - 5 MDIOS register address bits, up to 32 MDIOS registers can be addressed in each slave
- 2 turnaround state bits
  - On write operations, the master drives 10
  - On read operations, the first bit is high-impedance, and the second bit is driven by the slave to 0
- 16 data bits
  - On write operations, data written to slave’s MDIOS register is driven by the master
  - On read operations, data read from slave’s MDIOS register is driven by the slave

Each frame is usually preceded by a preamble, where the MDIOS stays at 1 for 32 MDC clocks. The master can continue to keep MDIO at 1, indicating the “idle” condition, when it has no frame to send.

When MDIO signal is driven by the master, MDIOS samples it using the rising edge of MDC. When MDIOS drives MDIO, the output changes on the rising edge of MDC.

**Figure 667. MDIO protocol write frame waveform**

MSV39128V1

**Figure 668. MDIO protocol read frame waveform**

MSV39127V1

### 59.3.4 MDIOS enabling and disabling

The MDIOS is enabled by setting the EN bit in the MDIOS\_CR register. When EN = 1, the MDIOS monitors the MDIO bus and service frames addressed to one of its MDIOS registers.

When the MDIOS is enabled (setting EN to 1), the same write operation to the MDIOS\_CR register must properly set the PORT\_ADDRESS[4:0] field to indicate the slave port address. A frame is ignored by the MDIOS if its port address is not the same as PORT\_ADDRESS[4:0] (presumably intended for another slave).

When EN=0, the MDIOS ignores the frames being transmitted on the MDC/MDIO lines, and the IP is in a reduced consumption mode. Clearing EN also clears all of the DIN registers. If EN is cleared while the MDIOS is driving read data, it immediately releases the bus and does not drive the rest of the data. If EN is cleared while the MDIOS is receiving a frame, the frame is aborted and the data is lost.

When the MDIOS is enabled, then disabled and subsequently re-enabled, the status flags are not cleared. For a correct operation the firmware must clear the status flag before re-enabling the MDIOS.

### 59.3.5 MDIOS data

From the point of view of the MDIO master, there are 32 16-bit MDIOS registers in the MDIOS which can be written and read. In reality, for each MDIOS register 'x' there are two sets of registers: MDIOS\_DINRx and MDIOS\_DOUTRx.

#### Input data

When the MDIO master transmits a frame which writes to MDIOS register 'x' in the MDIOS, it is the MDIOS\_DINRx register which is updated with the incoming data. The registers MDIOS\_DINR0 to MDIOS\_DINR31 can be read by the firmware, but they can be written only by the MDIO master via the MDIO bus.

The contents of MDIOS\_DINRx change immediately after the MDC rising edge when the last data bit is sampled.

If the firmware happens to read the contents of MDIOS\_DINRx at the moment that it is being updated, there is a possibility that the value read is corrupted (a bit-by-bit cross between the old value and the new value). For this reason, **the firmware must assure that two subsequent reads from the same MDIOS\_DINRx register give the same value and assure that the data is stable when it is read.** In the very worst case, the firmware needs to read MDIOS\_DINRx four times: first to get the old value, second to get an incoherent value (when reading at the moment the register changes), third to get the new value, and forth to confirm the new value.

If the firmware uses the WRF interrupt and can guarantee that it reads the MDIOS\_DINRx register before any new MDIOS write frame completes, the firmware can perform a single read.

If the MDIO master performs a write operation with a register address that is greater than 31, the MDIOS ignores the frame (the data is not saved and no flag is set).

#### Output data

When the MDIOS receives a frame which requests to read register 'x', it returns the value found in the MDIOS\_DOUTRx register. Thus, if the MDIO master expects to read the same value which it previously wrote to MDIOS register 'x', the firmware must copy the data from MDIOS\_DINRx to MDIOS\_DOUTRx each time new data is written to MDIOS\_DINRx. For correct operation, the firmware must copy the data to the MDIOS\_DOUTRx register within a preamble (if the master sends preambles before each frame) plus 15 cycles time.

When an MDIOS register is read via the MDIO bus, the MDIOS passes the 16-bit value (from the corresponding MDIOS\_DOUTRx register) to the MDIOS clock domain during the 15th cycle of the read frame. If the firmware attempts to write the MDIOS\_DOUTRx register while the MDIO Master is currently reading MDIOS register 'x', then the firmware write operation is ignored if it occurs during the 15th cycle of the frame (during a one-MDC-cycle

window). Therefore, **after writing a MDIOS\_DOUTRx register, the firmware must read back the same MDIOS\_DOUTRx register and confirm that the value was actually written**. If the MDIOS\_DOUTRx register does not contain the value which was written, then the firmware can simply try writing and re-reading again.

If the MDIOS frequency is very slow compared to the mdios\_pclk frequency, then it might be best not to tie up the CPU by continuously writing and re-reading a MDIOS\_DOUTRx register. Note that the read flag (RDFx) is set as soon as the MDIOS\_DOUTRx DOUT[15:0] value is passed to the MDIOS clock domain. Thus, when a write to MDIOS\_DOUTRx is ignored (when the value read back is not the value which was just written), then the firmware can use a read interrupt to know when it is able to write MDIOS\_DOUTRx.

Here is a procedure which can be used if the MDC clock is very slow:

1. Write MDIOS\_DOUTRx.
2. Assure that all of the read flags are zero (MDIOS\_RDFR = 0x0000). Clear the flags if necessary using MDIOS\_CRDFR.
3. Read back the same MDIOS\_DOUTRx register and compare the value with the value which was written in step 1.
4. If the values are the same, then the procedure is done. Otherwise, continue to step 5.
5. Enable read interrupts by setting the RDIE bit in MDIOS\_CR1.
6. In the interrupt routine, assure that RDFx is set. (no other read flags are set before bit x).
7. There is a 31 cycle + preamble time window (if the master sends a preamble before each frame) to write MDIOS\_DOUTRx safely without doing a read-back and compare. If this maximum delay cannot be guaranteed, go back to step 1.

If the MDIO master performs a read operation with a register address which is greater than 31, the MDIOS returns a data value of all zeros.

### 59.3.6 MDIOS APB frequency

Whenever the firmware reads from an MDIOS\_DINRx register or writes to an MDIOS\_DOUTRx register, the frequency of the APB bus must be at least 1.5 times the MDC frequency. For example, if MDC is at 20MHz, the APB must be at 30MHz or faster.

### 59.3.7 Write/read flags and interrupts

When MDIOS register 'x' is written via the MDIO bus, the WRFx bit in the MDIOS\_WFRF register is set. WRFx becomes '1' at the moment that MDIOS\_DINRx is updated, which is when the last data bit is sampled on a write frame. An interrupt is generated if WRIEN = 1 (in the MDIOS\_CR register). WRFx is cleared by software by writing 1 to CWRFX (in the MDIOS\_CWRFR register).

When MDIOS register 'x' is read via the MDIO bus, the RDFx bit in the MDIOS\_RDFR register is set. RDFx becomes 1 at the moment that MDIOS\_DOUTRx is copied to the MDC clock domain, which is on the 15th cycle of a read frame. An interrupt is generated if RDIEN=1 (in the MDIOS\_CR register). RDFx is cleared by software by writing 1 to CRDFx (in the MDIOS\_CRDFR register).

### 59.3.8 MDIOS error management

There are three types of errors with their corresponding error flags:

- Preamble error: PERF (bit 0 of MDIOS\_SR register)
- Start error: SERF (bit 1 of MDIOS\_SR register)
- Turnaround error: TERF (bit 2 of MDIOS\_SR register)

Each error flag is set by hardware when the corresponding error condition occurs. Each flag can be cleared by writing '1' to the corresponding bit in the clear flag register (MDIOS\_CLRFR).

An interrupt occurs if any of the three error flags is set while EIE = 1 (MDIOS\_CR).

Besides setting an error flag, the MDIOS performs no action for a frame in which an error is detected: the MDIOS\_DINRx registers are not updated and the MDIO line is not forced during the data phase.

For a given frame, errors do not accumulate. For example, if a preamble error is detected, no check is done for a start error or a turnaround error for the rest of the current frame.

When DPC = 0, following an detected error, all new frames and errors are ignored until a complete full preamble has been detected.

When DPC = 1 (Disable Preamble Check, MDIOS\_CR[7]), all frames and new errors are ignored as long as one of the error flags is set. As soon as the error bit is cleared, the MDIOS starts looking for a start sequence. Thus, the application must clear the error flag only when it is sure that no frame is currently in progress. Otherwise, the MDIOS likely misinterprets the bits being sent and becomes desynchronized with the master.

#### Preamble errors

A preamble error occurs when a start sequence begins (with MDIO sampled at 0) without being immediately preceded by a preamble (MDIO sampled at 1 for at least 32 consecutive clocks).

Preamble errors are not reported after the MDIOS is first enabled (EN=1 in MDIOS\_CR) until after a full preamble is received. This is to avoid an error condition when the peripheral frame detection is enabled while a preamble or frame is already in progress. In this case, the MDIOS ignores the first frame (since it did not first detect a full preamble), but does not set PERF.

If the DPC bit (Disable Preamble Check, MDIOS\_CR[7]) is set, then the MDIO Master can send frames without preceding preambles and no preamble error is signaled.

When DPC = 1, the application must assure that the master is not in the process of sending a frame at the moment that the MDIOS is enabled (EN is set). Otherwise, the slave might become desynchronized with the master.

#### Start errors

A start error occurs when an illegal start sequence occurs or if an illegal command is given. The start sequence must always be 01, and the command must be either 01 (write) or 10 (read).

As with preamble errors, start errors are not reported until after a full preamble is received.

### Turnaround errors

A turnaround error occurs when an error is detected in the turnaround bits of write frames. The 15th bit of the write frame must be 1 and the 16th bit must be 0.

Turnaround errors are only reported after a full preamble is received, there is no start error, the port address in the current frame matches and the register address is in the supported range 0 to 31.

### 59.3.9 MDIOS in Stop mode

The MDIOS can operate in Stop mode, responding to all reads, performing all writes, and causing the STM32 to wake up from Stop mode on MDIOS interrupts.

### 59.3.10 MDIOS interrupts

There is a single interrupt vector for the three types of interrupts (write, read, and error). Any of these interrupt sources can wake the STM32 up from Stop mode. All interrupt flags need to be cleared in order to clear the interrupt line.

Table 438. Interrupt control bits

Interrupt event	Event flag	Enable control bit
Write interrupt	WRF[31:0]	WRIE
Read interrupt	RDF[31:0]	RDIE
Error interrupt	PERF (preamble), SERF (start), TERF (turnaround)	EIE

## 59.4 MDIOS registers

### 59.4.1 MDIOS configuration register (MDIOS\_CR)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	PORT_ADDRESS[4:0]				DPC	Res.	Res.	Res.	EIE	RDIE	WRIE	EN	
			rw	rw	rw	rw	rw	rw				rw	rw	rw	rw

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:8 **PORT\_ADDRESS[4:0]**: slave address

Can be written only when the peripheral is disabled (EN = 0).

If the address given by the MDIO master matches PORT\_ADDRESS[4:0], then the MDIOS services the frame. Otherwise the frame is ignored.

Bit 7 **DPC**: disable preamble check

0: MDIO master must give preamble before each frame.

1: MDIO master can send each frame without a preceding preamble, and the MDIOS does not signal a preamble error.

*Note: When this bit is set, the application must be sure that no frame is currently in progress when the MDIOS is enabled. Otherwise, the MDIOS can become desynchronized with the master.*

*This bit cannot be changed unless EN = 0 (though it can be changed at the same time that EN is being set).*

Bits 6:4 Reserved, must be kept at reset value.

Bit 3 **EIE**: error interrupt enable

0: Interrupt is disabled.

1: Interrupt is enabled.

*Note: When this bit is set, an interrupt is generated if any of the error flags (PERF, SERF, or TERF in the MDIOS\_SR register) is set.*

Bit 2 **RDIE**: register read interrupt enable

0: Interrupt is disabled.

1: Interrupt is enabled.

*Note: When this bit is set, an interrupt is generated if any of the read flags (RDF[31:0] in the MDIOS\_RDFR register) is set.*

Bit 1 **WRIE**: register write interrupt enable

0: Interrupt is disabled.

1: Interrupt is enabled.

*Note: When this bit is set, an interrupt is generated if any of the read flags (WRF[31:0] in the MDIOS\_WRFR register) is set.*

Bit 0 **EN**: peripheral enable

0: MDIOS is disabled.

1: MDIOS is enabled and monitoring the MDIO bus (MDC/MDIO).

### 59.4.2 MDIOS write flag register (MDIOS\_WRFR)

Address offset: 0x004

Power-on reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
WRF[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WRF[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **WRF[31:0]**: write flags for MDIOS registers 0 to 31.

Each bit is set by hardware when the MDIO master performs a write to the corresponding MDIOS register. An interrupt is generated if WRIE (in MDIOS\_CR) is set.

Each bit is cleared by software by writing '1' to the corresponding CWRF bit in the MDIOS\_CWRFR register.

For WRFx:

0: MDIOS register x is not written by the MDIO master.

1: MDIOS register x is written by the MDIO master and the data is available in DIN[15:0] in the MDIOS\_DINRx register.

### 59.4.3 MDIOS clear write flag register (MDIOS\_CWRFR)

Address offset: 0x008

Power-on reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CWRFR[31:16]															
rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CWRFR[15:0]															
rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:0 **CWRFR[31:0]**: clear the write flag

Writing 1 to CWRFRx clears the WRFx bit in the MDIOS\_WRF register.

### 59.4.4 MDIOS read flag register (MDIOS\_RDFR)

Address offset: 0x00C

Power-on reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RDF[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RDF[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RDF[31:0]**: read flags for MDIOS registers 0 to 31.

Each bit is set by hardware when the MDIO master performs a read from the corresponding MDIOS register. An interrupt is generated if RDIE (in MDIOS\_CR) is set.

Each bit is cleared by software by writing '1' to the corresponding CRDF bit in the MDIOS\_CRDFR register.

For RDFx:

0: MDIOS register x is not read by the MDIO master.

1: MDIOS register x is read by the MDIO master.

### 59.4.5 MDIOS clear read flag register (MDIOS\_CRDFR)

Address offset: 0x010

Power-on reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CRDF[31:16]															
rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CRDF[15:0]															
rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:0 **CRDF[31:0]**: clear the read flag

Writing 1 to CRDFx clears the RDFx bit in the MDIOS\_RDF register.

### 59.4.6 MDIOS status register (MDIOS\_SR)

Address offset: 0x014

Power-on reset value: 0x0000 0000

Writes to this register have no effect.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TERF	SERF	PERF
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TERF**: turnaround error flag

0: No turnaround error has occurred.

1: A turnaround error has occurred.

Note: Writing 1 to CTERF (MDIOS\_CLRFR) clears this bit.

Bit 1 **SERF**: start error flag

0: No start error has occurred.

1: A start error has occurred.

Note: Writing 1 to CSERF (MDIOS\_CLRFR) clears this bit.

Bit 0 **PERF**: preamble error flag

0: No preamble error has occurred.

1: A preamble error has occurred.

Note: Writing 1 to CPERF (MDIOS\_CLRFR) clears this bit.

This bit is not set if DPC (disable preamble check, MDIOS\_CR[7]) is set.

### 59.4.7 MDIOS clear flag register (MDIOS\_CLRFR)

Address offset: 0x018

Power-on reset value: 0x0000 0000

Reads on this register returns all zeros.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CTERF	CSERF	CPERF
													rc_w1	rc_w1	rc_w1

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CTERF**: clear the turnaround error flag

Writing 1 to this bit clears the TERF flag (in MDIOS\_SR).

When DPC = 1 (MDIOS\_CR[7]), the TERF flag must be cleared only when there is not a frame already in progress.

Bit 1 **CSERF**: clear the start error flag

Writing 1 to this bit clears the SERF flag (in MDIOS\_SR).

When DPC = 1 (MDIOS\_CR[7]), the SERF flag must be cleared only when there is not a frame already in progress.

Bit 0 **CPERF**: clear the preamble error flag

Writing 1 to this bit clears the PERF flag (in MDIOS\_SR).

### 59.4.8 MDIOS input data register x (MDIOS\_DINRx)

Address offset: 0x100 + 0x4 \* x, (x = 0 to 31)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DIN[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **DIN[15:0]**: input data received from MDIO master during write frames  
 This field is written by hardware with the 16-bit data received in a write frame which is addressed to MDIOS register x.

**59.4.9 MDIOS output data register x (MDIOS\_DOUTRx)**

Address offset: 0x180 + 0x4 \* x, (x = 0 to 31)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DOUT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **DOUT[15:0]**: output data sent to MDIO Master during read frames  
 This field is written by software. These 16 bits are serially output on the MDIO bus during read frames which address the MDIOS register x.

**59.4.10 MDIOS register map**

**Table 439. MDIOS register map and reset values**

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Refer to [Section 2.3 on page 129](#) for the register boundary addresses.

## 60 Secure digital input/output MultiMediaCard interface (SDMMC)

### 60.1 SDMMC main features

The SD/SDIO, embedded MultiMediaCard (e•MMC) host interface (SDMMC) provides an interface between the AHB bus and SD memory cards, SDIO cards and e•MMC devices.

The MultiMediaCard system specifications are available through the MultiMediaCard Association website at [www.jedec.org](http://www.jedec.org), published by the MMCA technical committee.

SD memory card and SD I/O card system specifications are available through the SD card Association website at [www.sdcard.org](http://www.sdcard.org).

The SDMMC features include the following:

- Compliance with *Embedded MultiMediaCard System Specification Version 4.51*. Card support for three different databus modes: 1-bit (default), 4-bit and 8-bit. (HS200 SDMMC\_CK speed limited to maximum allowed I/O speed)
- Full compatibility with previous versions of MultiMediaCards (backward compatibility).
- Full compliance with *SD memory card specifications version 4.1*. (SDR104 SDMMC\_CK speed limited to maximum allowed I/O speed, SPI mode and UHS-II mode not supported).
- Full compliance with *SDIO card specification version 4.0*. Card support for two different databus modes: 1-bit (default) and 4-bit. (SDR104 SDMMC\_CK speed limited to maximum allowed I/O speed, SPI mode and UHS-II mode not supported).
- Data transfer up to 208 Mbyte/s for the 8-bit mode. (depending maximum allowed I/O speed).
- Data and command output enable signals to control external bidirectional drivers.

The MultiMediaCard/SD bus connects cards to the host.

The current version of the SDMMC supports only one SD/SDIO/e•MMC card at any one time and a stack of e•MMC.

### 60.2 SDMMC implementation

Table 440. SDMMC features

SDMMC modes/features <sup>(1)</sup>	SDMMC1	SDMMC2
Variable delay (SDR104, HS200)	X	X
SDMMC_CKIN	X	-
SDMMC_CDIN, SDMMC_D0DIR	X	-
SDMMC_D123DIR	X	-
MDMA data transfer end	X	-
MDMA command end	X	-
MDMA buffer end	X	-

1. X = supported.

### 60.3 SDMMC bus topology

Communication over the bus is based on command/response and data transfers.

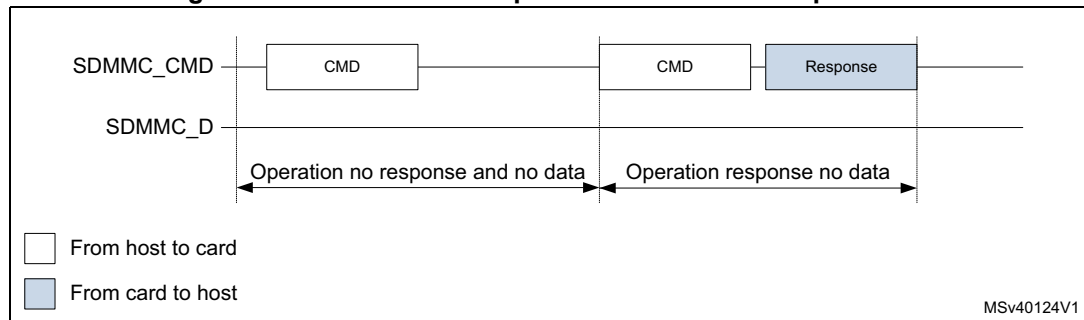

The basic transaction on the SD/SDIO/eMMC bus is the command/response transaction. These types of bus transaction transfer their information directly within the command or response structure. In addition, some operations have a data token.

Data transfers are done in the following ways:

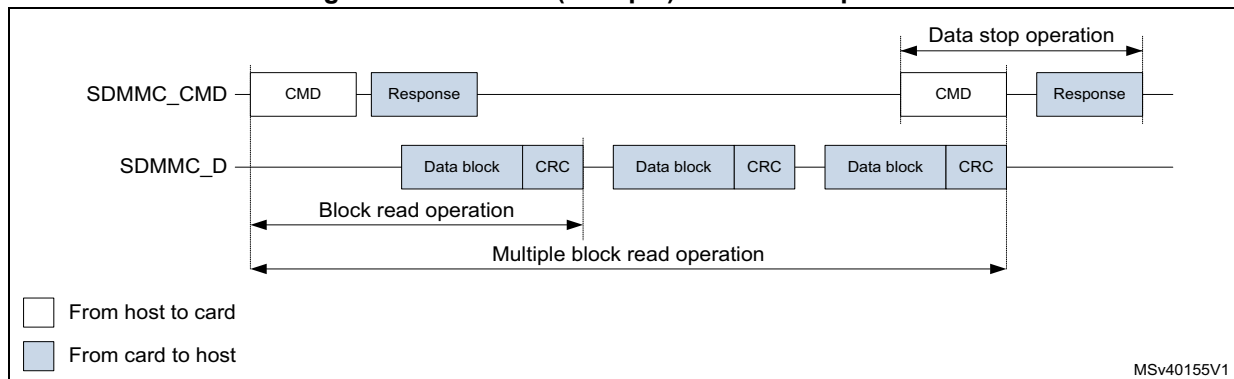

- Block mode: data block(s) with block size  $2^N$  bytes with N in the range 0-14.
- SDIO multibyte mode: single data block with block size range 1-512 bytes
- eMMC Stream mode: continuous data stream

Data transfers to/from eMMC cards are done in data blocks or streams.

**Figure 669. SDMMC “no response” and “no data” operations**

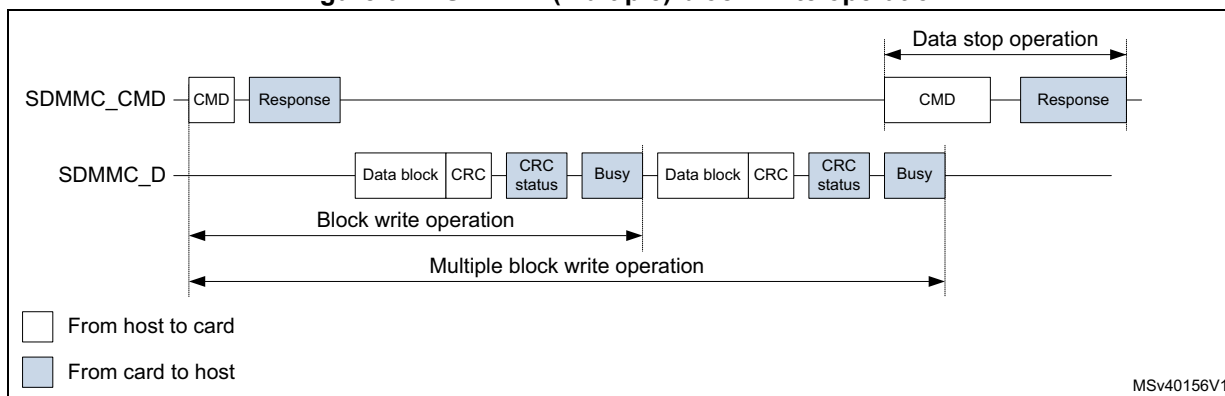

**Figure 670. SDMMC (multiple) block read operation**

**Note:** The Stop Transmission command is not required at the end of a eMMC multiple block read with predefined block count.

Figure 671. SDMMC (multiple) block write operation

Note: The Stop Transmission command is not required at the end of an eMMC multiple block write with predefined block count.

Note: The SDMMC does not send any data as long as the Busy signal is asserted (SDMMC\_D0 pulled low).

Figure 672. SDMMC (sequential) stream read operation

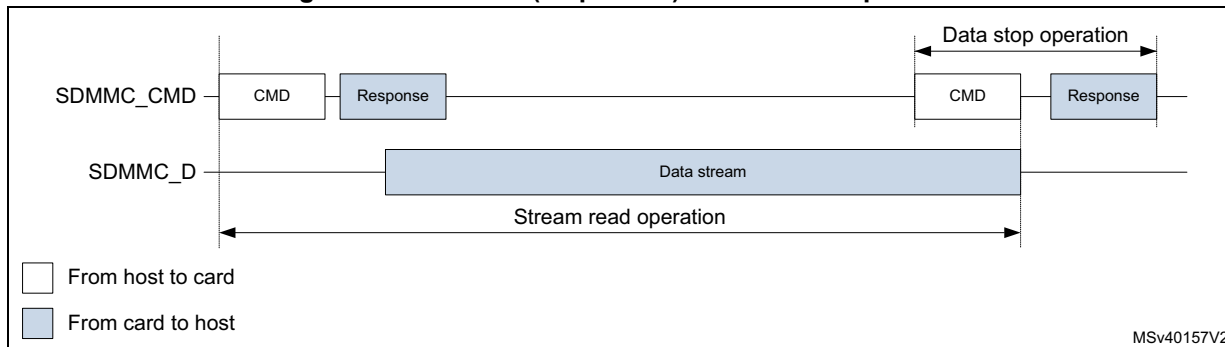

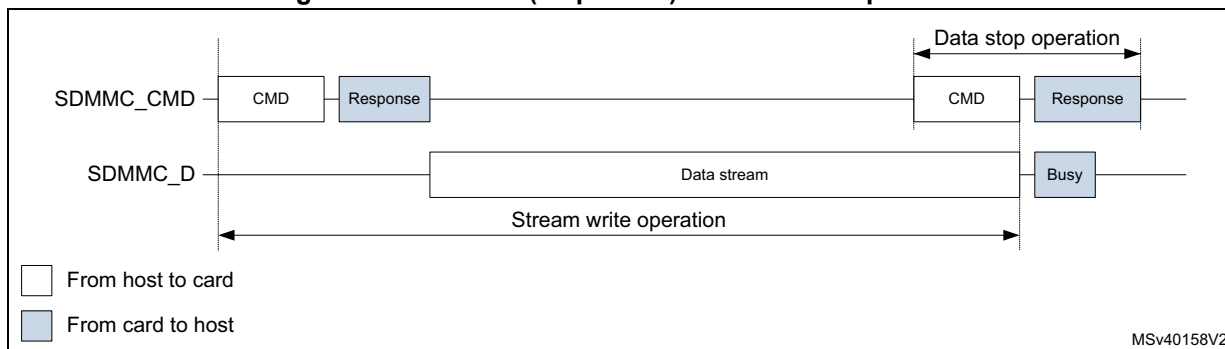

Figure 673. SDMMC (sequential) stream write operation

Stream data transfer operates only in a 1-bit wide bit bus configuration on SDMMC\_D0 in single data rate modes (DS, HS, and SDR).

## 60.4 SDMMC operation modes

**Table 441. SDMMC operation modes SD & SDIO**

SDIO Bus Speed modes <sup>(1)(2)</sup>	Max Bus Speed <sup>(3)</sup> [Mbyte/s]	Max Clock frequency [MHz] <sup>(4)</sup>	Signal Voltage [V]
DS (Default Speed)	12.5	25	3.3
HS (High Speed)	25	50	3.3
SDR12	12.5	25	1.8
SDR25	25	50	1.8
DDR50	50	50	1.8
SDR50	50	100	1.8
SDR104	104	208	1.8

1. SDR single data rate signaling.
2. DDR double data rate signaling. (data is sampled on both SDMMC\_CK clock edges).
3. SDIO bus speed with 4bit bus width.
4. Maximum frequency depending on maximum allowed IO speed.

SDR104 mode requires variable delay support using sampling point tuning. The use of variable delay is optional for SDR50 mode.

**Table 442. SDMMC operation modes eMMC**

eMMC bus speed modes <sup>(1)(2)</sup>	Max bus speed <sup>(3)</sup> [Mbyte/s]	Max clock frequency [MHz] <sup>(4)</sup>	Signal voltage [V] <sup>(5)</sup>
Legacy compatible	26	26	3/1.8/1.2V
High speed SDR	52	52	3/1.8/1.2V
High speed DDR	104	52	3/1.8/1.2V
High speed HS200	200	200	1.8/1.2V

1. SDR single data rate signaling.
2. DDR double data rate signaling. (data is sampled on both SDMMC\_CK clock edges).
3. eMMC bus speed with 8bit bus width.
4. Maximum frequency depending on maximum allowed IO speed.
5. Supported signal voltage level depend on I/O port characteristics, refer to device datasheet.

HS200 mode requires variable delay support using sampling point tuning.

## 60.5 SDMMC functional description

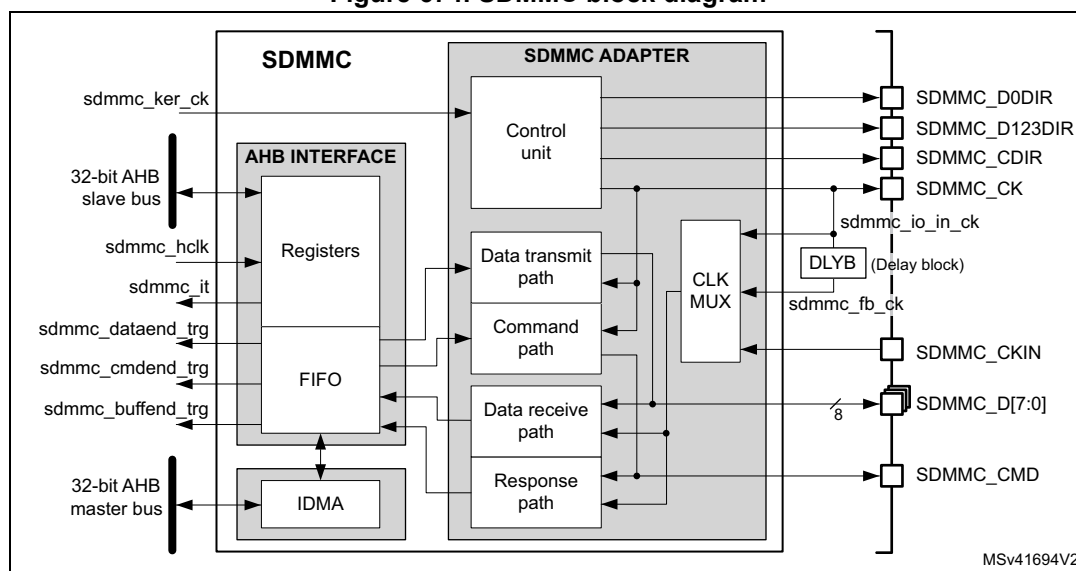

The SDMMC consists of four parts:

- The AHB slave interface accesses the SDMMC adapter registers, and generates interrupt signals and IDMA control signals.
- The SDMMC adapter block provides all functions specific to the eMMC/SD/SD I/O card such as the clock generation unit, command and data transfer.
- The internal DMA (IDMA) block with its AHB master interface.
- A delay block (DLYB) taking care of the receive data sample clock alignment. The delay block is NOT part of the SDMMC. A delay block is mandatory when supporting SDR104 or HS200.

### 60.5.1 SDMMC block diagram

Figure 674 shows the SDMMC block diagram.

Figure 674. SDMMC block diagram

### 60.5.2 SDMMC pins and internal signals

Table 443 lists the SDMMC internal input/output signals, Table 444 the SDMMC pins (alternate functions).

Table 443. SDMMC internal input/output signals

Signal name	Signal type	Description
sdmmc_ker_ck	Digital input	SDMMC kernel clock
sdmmc_hclk	Digital input	AHB clock
sdmmc_it	Digital output	SDMMC global interrupt
sdmmc_dataend_trg	Digital output	SDMMC data end trigger for MDMA
sdmmc_cmdend_trg	Digital output	SDMMC command end trigger for MDMA

Table 443. SDMMC internal input/output signals (continued)

Signal name	Signal type	Description
sdmmc_buffend_trg	Digital output	SDMMC internal DMA buffer end trigger for MDMA
sdmmc_io_in_ck	Digital input	SD/SDIO/eMMC card feedback clock. This signal is internally connected to the SDMMC_CK pin (for DS and HS modes).
sdmmc_fb_ck	Digital input	SD/SDIO/eMMC card tuned feedback clock after DLYB delay block (for SDR50, DDR50, SDR104, HS200)

Table 444. SDMMC pins

Signal name	Signal type	Description
SDMMC_CK	Digital output	Clock to SD/SDIO/eMMC card
SDMMC_CKIN	Digital input	Clock feedback from an external driver for SD/SDIO/eMMC card. (for SDR12, SDR25, SDR50, DDR50)
SDMMC_CMD	Digital input/output	SD/SDIO/eMMC card bidirectional command/response signal.
SDMMC_CDIR	Digital output	SD/SDIO/eMMC card I/O direction indication for the SDMMC_CMD signal.
SDMMC_D[7:0]	Digital input/output	SD/SDIO/eMMC card bidirectional data lines.
SDMMC_D0DIR	Digital output	SD/SDIO/eMMC card I/O direction indication for the SDMMC_D0 data line.
SDMMC_D123DIR	Digital output	SD/SDIO/eMMC card I/O direction indication for the data lines SDMMC_D[3:1].

### 60.5.3 General description

The **SDMMC\_D[7:0]** lines have different operating modes:

- By default, SDMMC\_D0 line is used for data transfer. After initialization, the host can change the databus width.
- For an eMMC, 1-bit (SDMMC\_D0), 4-bit (SDMMC\_D[3:0]) or 8-bit (SDMMC\_D[7:0]) data bus widths can be used.
- For an SD or an SDIO card, 1-bit (SDMMC\_D0) or 4-bit (SDMMC\_D[3:0]) can be used. All data lines operate in push-pull mode.

To allow the connection of an external driver (a voltage switch transceiver), the direction of data flow on the data lines is indicated with I/O direction signals. The **SDMMC\_D0DIR** signal indicates the I/O direction for the SDMMC\_D0 data line, the **SDMMC\_D123DIR** for the SDMMC\_D[3:1] data lines.

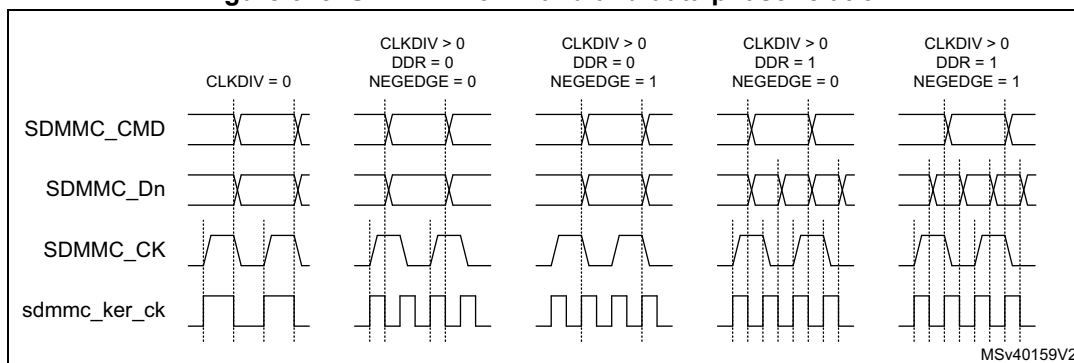

**SDMMC\_CMD** only operates in push-pull mode:

To allow the connection of an external driver (a voltage switch transceiver), the direction of data flow on the SDMMC\_CMD line is indicated with the I/O direction signal **SDMMC\_CDIR**.

**SDMMC\_CK** clock to the card originates from **sdmmc\_ker\_ck**:

- When the **sdmmc\_ker\_ck** clock has 50 % duty cycle, it can be used even in bypass mode (CLKDIV = 0).
- When the **sdmmc\_ker\_ck** duty cycle is not 50 %, the CLKDIV must be used to divide it by 2 or more (CLKDIV > 0).
- The phase relation between the SDMMC\_CMD / SDMMC\_D[7:0] outputs and the SDMMC\_CK can be selected through the NEGEDGE bit. The phase relation depends on the CLKDIV, NEGEDGE, and DDR settings. See [Figure 675](#).

**Figure 675. SDMMC Command and data phase relation**

**Table 445. SDMMC Command and data phase selection**

CLKDIV	DDR	NEGEDGE	SDMMC_CK	Command out	Data out
0	x	x	= sdmmc_ker_ck	generated on sdmmc_ker_ck falling edge	
>0	0	0	generated on sdmmc_ker_ck rising edge	generated on sdmmc_ker_ck falling edge succeeding the SDMMC_CK rising edge.	
		1		generated on the same sdmmc_ker_ck rising edge that generates the SDMMC_CK falling edge.	
	1	0		generated on sdmmc_ker_ck falling edge succeeding the SDMMC_CK rising edge.	generated on sdmmc_ker_ck falling edge succeeding a SDMMC_CK edge.
		1		generated on the same sdmmc_ker_ck rising edge that generates the SDMMC_CK falling edge.	

By default, the **sdmmc\_io\_in\_ck** feedback clock input is selected for sampling incoming data in the SDMMC receive path. It is derived from the SDMMC\_CK pin.

For tuning the phase of the sampling clock to accommodate the receive data timing, the DLYB delay block available on the device can be connected between **sdmmc\_io\_in\_ck** signal (DLYB input dlyb\_in\_ck) and **sdmmc\_fb\_ck** clock input of SDMMC (DLYB output dlyb\_out\_ck). Selecting the **sdmmc\_fb\_ck** clock input in the receive path then enables using the phase-tuned sampling clock for the incoming data. This is required for SDMMC to support the SDR104 and HS200 operating mode and optional for SDR50 and DDR50 modes.

When using an external driver (a voltage switch transceiver), the SDMMC\_CKIN feedback clock input can be selected to sample the receive data.

For an SD/SDIO/eMMC card, the clock frequency can vary between 0 and 208 MHz (limited by maximum I/O speed).

Depending on the selected bus mode (SDR or DDR), one bit or two bits are transferred on SDMMC\_D[7:0] lines with each clock cycle. The SDMMC\_CMD line transfers only one bit per clock cycle.

#### 60.5.4 SDMMC adapter

The SDMMC adapter (see [Figure 674: SDMMC block diagram](#)) is a multimedia/secure digital memory card bus master that provides an interface to a MultiMediaCard stack or to a secure digital memory card. It consists of the following subunits:

- Control unit
- Data transmit path
- Command path
- Data receive path
- Response path
- Receive data path clock multiplexer
- Delay block (DLYB), external to the SDMMC
- Adapter register block
- Data FIFO
- Internal DMA (IDMA)

*Note:* The adapter registers and FIFO use the AHB clock domain (`sdmmc_hclk`). The control unit, command path and data transmit path use the SDMMC adapter clock domain (`sdmmc_ker_ck`). The response path and data receive path use the SDMMC adapter feedback clock domain from the `sdmmc_io_in_ck`, or `SDMMC_CKIN`, or from the `sdmmc_fb_ck` generated by DLYB.

The DLYB delay block on the device can be used in conjunction with the SDMMC adapter, to tune the phase of the sampling clock for incoming data in SDMMC receive mode. It is required for the SDMMC to support the SDR104 and HS200 operating mode and optional for SDR50 and DDR50 modes.

##### Adapter register block

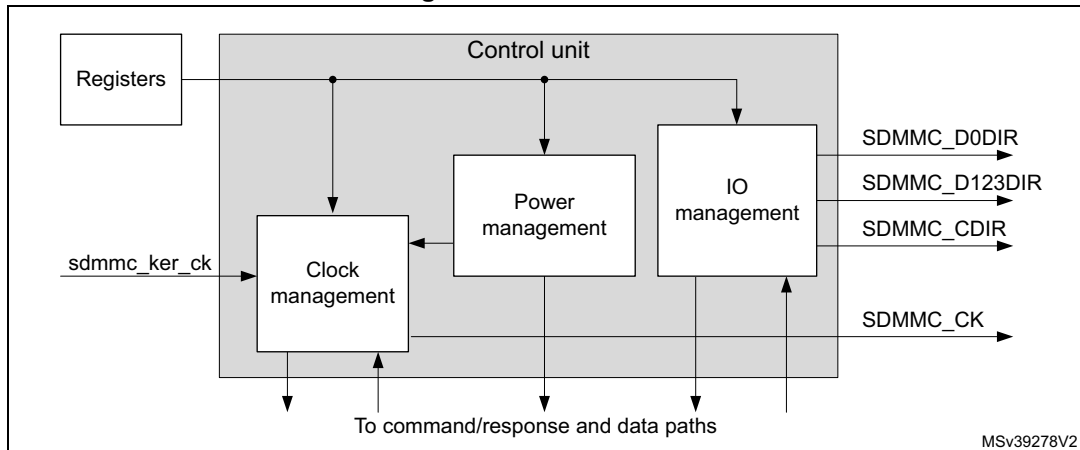

The adapter register block contains all system control registers, the SDMMC command and response registers and the data FIFO.

This block also generates the signals from the corresponding bit location in the SDMMC Clear register that clear the static flags in the SDMMC adapter.

##### Control unit

The control unit illustrated in [Figure 676](#), contains the power management functions, the SDMMC\_CK clock management with divider, and the I/O direction management.

Figure 676. Control unit

The power management subunit disables the card bus output signals during the power-off and power-up phases.

There are three power phases:

- power-off
- power-up
- power-on

The clock management subunit uses the `sdmmc_ker_ck` to generate the `SDMMC_CK` and provides the division control. It also takes care of stopping the `SDMMC_CK` for i.e. flow control.

The clock outputs are inactive:

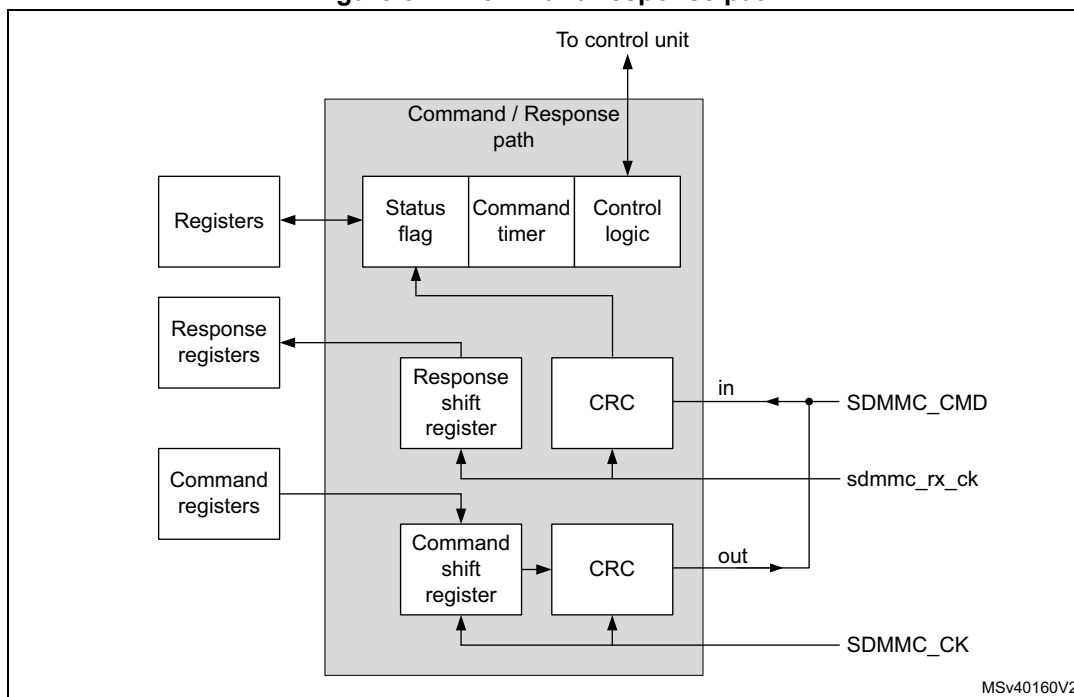

- after reset
- during the power-off or power-up phases
- if the power saving mode (register bit `PWRSV`) is enabled and the card bus is in the Idle state for eight clock periods. The clock is stopped eight cycles after both the command/response CPSM and data path DPSM subunits have entered the Idle phase. The clock is restarted when the command/response CPSM or data path DPSM is activated (enabled).

The I/O management subunit takes care of the `SDMMC_Dn` and `SDMMC_CMD` I/O direction signals, which controls the external voltage transceiver.

### Command/response path

The command/response path subunit transfers commands and responses on the `SDMMC_CMD` line. The command path is clocked on the `SDMMC_CK` and sends commands to the card. The response path is clocked on the `sdmmc_rx_ck` and receives responses from the card.

Figure 677. Command/response path

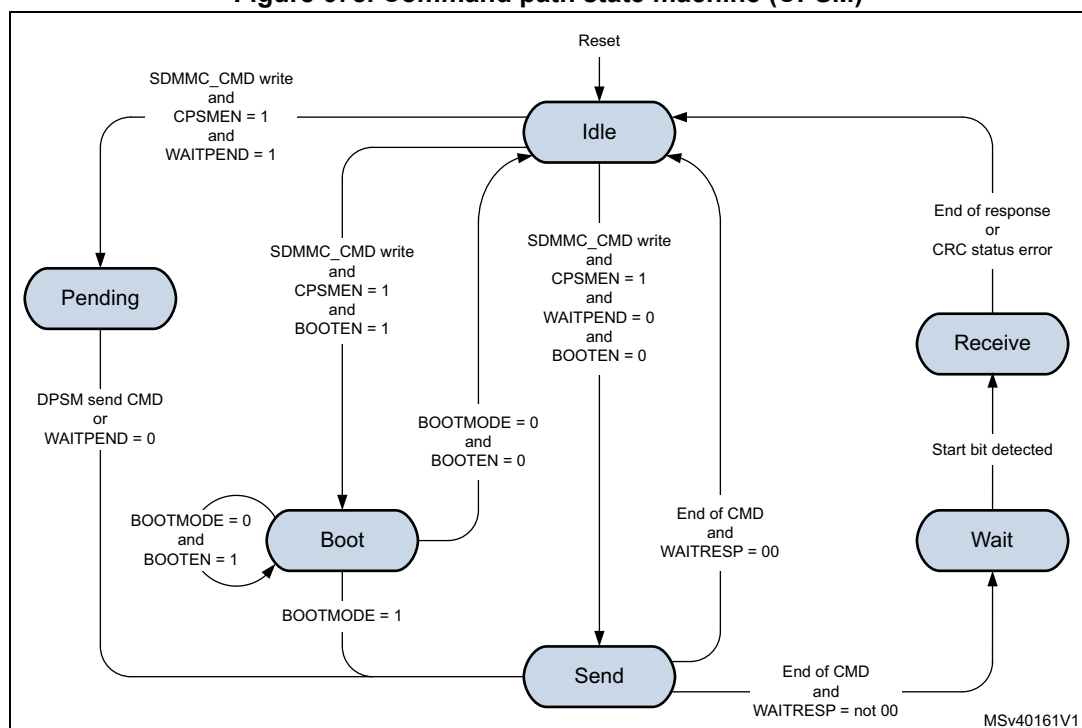

Command/response path state machine (CPSM)

- When the command register is written to and the enable bit is set, command transfer starts. When the command has been sent the CRC is appended and the command path state machine (CPSM) sets the status flags and:
  - if a response is not required enters the Idle state.
  - If a response is required, it waits for the response.
- When the response is received,
  - for a response with CRC, the received CRC code and the internally generated code are compared, and the appropriate status flag is set according the result.
  - for a response without CRC, no CRC is checked, and the appropriate status flag is not set.

When ever the CPSM is active, i.e. not in the Idle state, the CPSMACT bit is set.

Figure 678. Command path state machine (CPSM)

- Idle:** The command path is inactive. When the command control register is written and the enable bit (CPSMEN) is set, the CPSM activates the SDMMC\_CK clock (when stopped due to power save PWRSAPV bit) and moves
  - to the Send state when WAITPEND = 0 & BOOTEN = 0.
  - to the Pending state when WAITPEND = 1.
  - to the Boot state when BOOTEN = 1.
- Send:** The command is sent and the CRC is appended.
  - When CMDTRANS bit is set or when BOOTEN bit is set and BOOTMODE is alternative boot, and the DTDIR = receive, the CPSM DataEnable signal is issued to the DPSM at the end of the command.
  - When the CMDTRANS bit is set and the CMDSUSPEND bit is 0 the interrupt period is terminated at the end of the command.
  - When CMDSTOP bit is set the CPSM Abort signal is issued to the DPSM at the end of the command.
  - If no response is expected (WAITRESP = 00) the CPSM moves to the Idle state and the CMDSENT flag is set. When BOOTMODE = 1 & BOOTEN = 0 the CMDSENT flag is delayed 56 cycles after the command end bit, otherwise the

- CMDSENT flag is generated immediately after the command end bit.  
The RESPCMDR and RESPxR registers are not modified.
- If a command response is expected (WAITRESP = not 00) the CPSM moves to the Wait state and start the response timeout.
  - **Wait:** The command path waits for a response.
    - When WAITINT bit is 0 the command timer starts running and the CPSM waits for a start bit.
      - a) If a start bit is detected before the timeout the CPSM moves to the Receive state.
      - b) If the timeout is reached before the CPSM detect a response start bit, the timeout flag (CTIMEOUT) is set and the CPSM moves to the Idle state.  
The RESPCMDR and RESPxR registers are not modified.
    - When WAITINT bit is 1, the timer is disabled and the CPSM waits for an interrupt request (response start bit) from one of the cards.
      - a) When a start bit is detected the CPSM moves to the Receive state.
      - b) When writing WAITINT to 0 (interrupt mode abort), the host sends a response by its self and on detecting the start bit the CPSM move to the Receive state.
  - **Receive:** The command response is received. Depending the response mode bits WAITRESP in the command control register, the response can be either short or long, with CRC or without CRC. The received CRC code when present is verified against the internally generated CRC code.
    - When the CMDSUSPEND bit is set and the SDIO Response bit BS = 0 (response bit [39]), the interrupt period is started after the response.  
When the CMDSUSPEND bit is cleared, or the CMDSUSPEND bit is 1 and the SDIO Response bit BS = 1 (response bit [39]), there is no interrupt period started.
    - When the CMDTRANS bit is set and the CMDSUSPEND bit is set and the SDIO Response bit DF= 1 (response bit [32]) the interrupt period is terminated after the response.
    - When the CRC status passes or no CRC is present the CMDREND flag is set, the CPSM moves to the Idle state.  
The RESPCMDR and RESPxR registers are updated with received response.
      - When BOOTMODE = 1 & BOOTEN = 0 the CMDREND flag is delayed 56 cycles after the response end bit, otherwise the CMDREND flag is generated immediately after the response end bit.
      - When CMDTRANS bit is set and the DTDIR = transmit, the CPSM DataEnable signal is issued to the DPSM at the end of the command response.
    - When the CRC status fails the CCRCFAIL flag is set and the CPSM moves to the Idle state.  
The RESPCMDR and RESPxR registers are updated with received response.
  - **Pending:** According the pending WAITPEND bit in the command register, the CPSM enters the pending state.
    - When DATALENGTH =< 5 bytes the CPSM moves to the Sent state and generates the DataEnable signal to start the data transfer aligned with the CMD12 Stop Transmission command.
    - When DATALENGTH > 5 bytes, the CPSM DataEnable signal is issued to the DPSM to start the data transfer. The CPSM waits for a send CMD signal from the

- DPSM before moving to the Send state. This enables i.e. the CMD12 Stop Transmission command to be sent aligned with the data.
- When writing WAITPEND to 0, the CPSM moves to the Send state.
  - **Boot:** If the BOOTEN bit is set in the command register, the CPSM enters the Boot state, and when:
    - BOOTMODE = 0 the SDMMC\_CMD line is driven low and when CMDTRANS bit is set and the DTDIR = receive, the CPSM DataEnable signal is issued to the DPSM. This enables normal boot operation. This state is left at the end of the boot procedure by clearing the register bit BOOTEN, which cause the SDMMC\_CMD line to be driven high and the CPSM Abort signal is issued to the DPSM, before moving to the Idle state. The CMDSENT flag is generated 56 cycles after SDMMC\_CMD line is high.
    - BOOTMODE = 1, move to the Send state. This enables sending of the CMD0 (boot). Clearing BOOTEN has no effect.

*Note:* The CPSM remains in the Idle state for at least eight SDMMC\_CK periods to meet the  $N_{CC}$  and  $N_{RC}$  timing constraints.  $N_{CC}$  is the minimum delay between two host commands, and  $N_{RC}$  is the minimum delay between the host command and the card response.

*Note:* The response timeout has a fixed value of 64 SDMMC\_CK clock periods.

A command is a token that starts an operation. Commands are sent from the host to either a single card (addressed command) or all connected cards (broadcast command are available for eMMC V3.31 or previous). Commands are transferred serially on the SDMMC\_CMD line. All commands have a fixed length of 48 bits. The general format for a command token for SD-Memory cards, SDIO cards, and eMMC cards is shown in [Table 446](#).

The command token data is taken from 2 registers, one containing a 32-bits argument and the other containing the 6-bits command index (six bits sent to a card).

**Table 446. Command token format**

Bit position	Width	Value	Description
47	1	0	Start bit
46	1	1	Transmission bit
[45:40]	6	x	Command index
[39:8]	32	x	Argument
[7:1]	7	x	CRC7
0	1	1	End bit

Next to the command data there are command type (WAITRESP) bits controlling the command path state machine (CPSM). These bits also determine whether the command requires a response, and whether the response is short (48 bit) or long (136 bits) long, and if a CRC is present or not.

A response is a token that is sent from an addressed card or synchronously from all connected cards to the host as an answer to a previous received command. All responses are sent via the command line SDMMC\_CMD. The response transmission always starts with the left bit of the bit string corresponding to the response code word. The code length depends on the response type. Response tokens R1, R2, R3, R4, R5, and R6 have various

coding schemes, depending on their content. The general formats for the response tokens for SD-Memory cards, SDIO cards, and eMMC cards are shown in [Table 447](#), [Table 448](#) and [Table 449](#).

A response always starts with a start bit (always 0), followed by the bit indicating the direction of transmission (card = 0). A value denoted by x in the tables below indicates a variable entry. Most responses, except some, are protected by a CRC. Every command code word is terminated by the end bit (always 1).

The response token data is stored in 5 registers, four containing the 32-bits card status, OCR register, argument or 127-bits CID or CSD register including internal CRC, and one register containing the 6-bits command index.

**Table 447. Short response with CRC token format**

Bit position	Width	Value	Description
47	1	0	Start bit
46	1	0	Transmission bit
[45:40]	6	x	Command index (or reserved 111111)
[39:8]	32	x	Argument
[7:1]	7	x	CRC7
0	1	1	End bit

**Table 448. Short response without CRC token format**

Bit position	Width	Value	Description
47	1	0	Start bit
46	1	0	Transmission bit
[45:40]	6	x	Command index (or reserved 111111)
[39:8]	32	x	Argument
[7:1]	7	1111111	(reserved 1111111)
0	1	1	End bit

**Table 449. Long response with CRC token format**

Bit position	Width	Value	Description
135	1	0	Start bit
134	1	0	Transmission bit
[133:128]	6	111111	Reserved
[127:1]	127:8	x	CID or CSD slices
	7:1	x	CRC7 (included in CID or CSD)
0	1	1	End bit

The command/response path operates in a half-duplex mode, so that either commands can be sent or responses can be received. If the CPSM is not in the Send state, the

SDMMC\_CMD output is in the Hi-Z state. Data sent on SDMMC\_CMD are synchronous with the SDMMC\_CK according to the NEGEDGE register bit see [Figure 675](#).

The command and short response with CRC, the CRC generator calculates the CRC checksum for all 40 bits before the CRC code. This includes the start bit, transmission bit, command index, and command argument (or card status).

For the long response the CRC checksum is calculated only over the 120 bits of R2 CID or CSD. Note that the start bit, transmission bit and the six reserved bits are not used in the CRC calculation.

The CRC checksum is a 7-bit value:

$$\text{CRC}[6:0] = \text{remainder} [(M(x) * x^7) / G(x)]$$

$$G(x) = x^7 + x^3 + 1$$

$$M(x) = (\text{first bit}) * x^n + (\text{second bit}) * x^{n-1} + \dots + (\text{last bit before CRC}) * x^0$$

Where n = 39 or 119.

The CPSM can send a number of specific commands to handle various operating modes when CPSMEN is set, see [Table 450](#).

**Table 450. Specific Commands overview**

VSWITCH	BOOTEN	BOOTMOD	CMDTRAN	WAITPEND	CMDSTOP	WAITINT	Description
1	x	x	x	x	x	x	Start Voltage Switch Sequence
0	1	x	x	x	x	x	Start normal boot
0	1	1	x	x	x	x	Start alternative boot
0	0	1	x	x	x	x	Stop alternative boot.
0	0	0	1	x	x	x	Send command with associated data transfer.
0	0	0	0	1	1	x	eMMC stream data transfer, command (STOP_TRANSMISSION) pending until end of data transfer.
0	0	0	0	1	0	x	eMMC stream data transfer, command different from (STOP_TRANSMISSION) pending until end of data transfer.
0	0	0	0	0	1	x	Send command (STOP_TRANSMISSION), stopping any ongoing data transmission.
0	0	0	0	0	0	1	Enter eMMC wait interrupt (Wait-IRQ) mode.
0	0	0	0	0	0	0	Any other none specific command

The command/response path implements the status flags and associated clear bits shown in [Table 451](#):

**Table 451. Command path status flags**

Flag	Description
CMDSENT	Set at the end of the command without response. (CPSM moves from Send to Idle)
CMDREND	Set at the end of the command response when the CRC is OK. (CPSM moves from Receive to Idle)
CCRCFAIL	Set at the end of the command response when the CRC is FAIL. (CPSM moves from Receive to Idle)
CTIMEOUT	Set after the command when no response start bit received before the timeout. (CPSM moves from Wait to Idle)
CKSTOP	Set after the voltage switch (VSWITCHEN = 1) command response when the CRC is OK and the SDMMC_CK is stopped. (no impact on CPSM)
VSWEND	Set after the voltage switch (VSWITCH = 1) timeout of 5 ms + 1 ms. (no impact on CPSM)
CPSMACT	Command transfer in progress. (CPSM not in Idle state)

The command path error handling is shown in [Table 452](#):

**Table 452. Command path error handling**

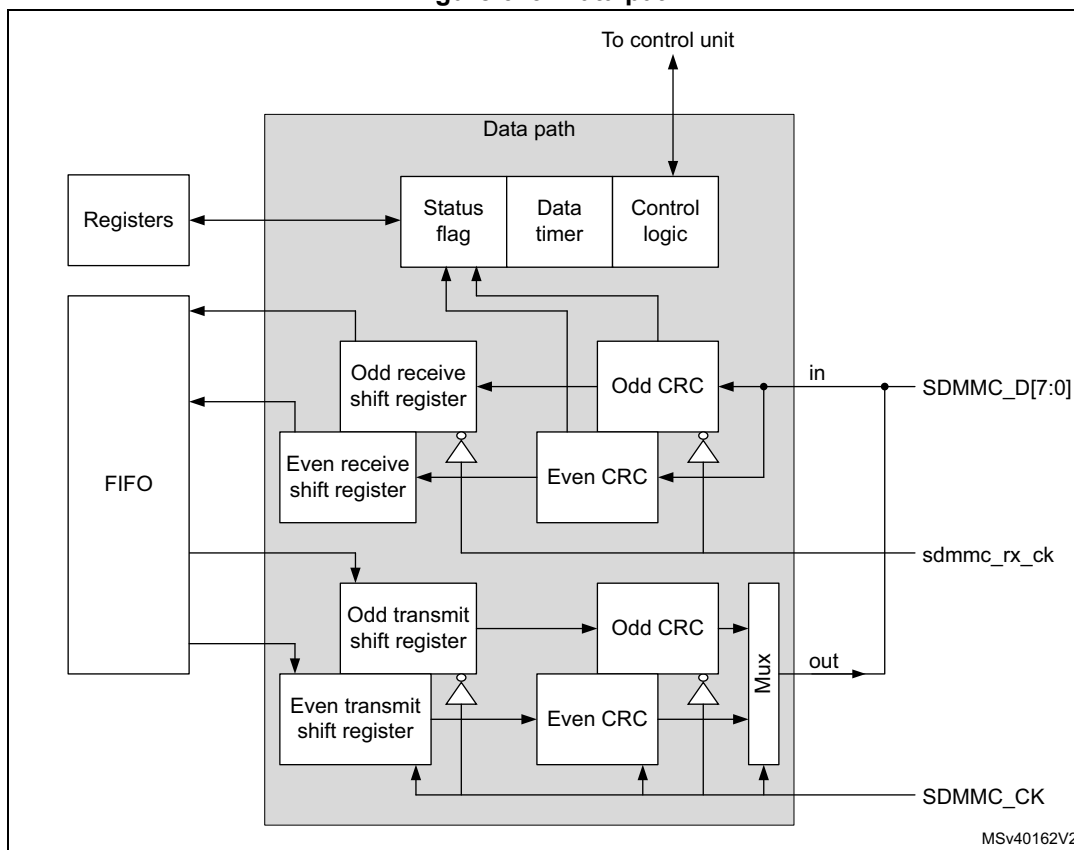

Error	CPSM state	Cause	Card action	Host action	CPSM action
Timeout	Wait	No start bit in time	Unknown	Reset or cycle power card <sup>(1)</sup>	Move to Idle
CRC status	Receive	Negative status	Command ignored	Resend command <sup>(1)</sup>	Move to Idle
		Transmission error	Command accepted	Resend command <sup>(1)</sup>	

1. When CMDTRANS is set, also a stop\_transmission command must be send to move the DPSM to Idle.

### Data path

The data path subunit transfers data on the SDMMC\_D[7:0] lines to and from cards. The data transmit path is clocked on the SDMMC\_CK and sends data to the card. The data receive path is clocked on the sdmmc\_rx\_ck and receives data from the card. [Figure 679](#) shows the data path block diagram.

Figure 679. Data path

The card data bus width can be programmed in the clock control register bits WIDBUS. The supported data bus width modes are:

- If the wide bus mode is not enabled, only one bit is transferred over SDMMC\_D0.
- If the 4-bit wide bus mode is enabled, data is transferred at four bits over SDMMC\_D[3:0].
- If the 8-bit wide bus mode is enabled, data is transferred at eight bits over SDMMC\_D[7:0].

Next to the data bus width the data sampling mode can be programmed in the clock control register bit DDR. The supported data sampling modes are:

- Single data rate signaling (SDR), data is clocked on the rising edge of the clock.
- Double data rate signaling (DDR), data is clocked on the both edges of the clock. DDR mode is only supported in wide bus mode (4-bit wide and 8-bit wide).

*Note: The data sampling mode only applies to the SDMMC\_D[7:0] lines. (not applicable to the SDMMC\_CMD line.)*

In DDR mode, data is sampled on both edges of the SDMMC\_CK according the following rules, see also [Figure 680](#) and [Figure 681](#):

- On the rising edge of the clock odd bytes are sampled.
- On the falling edge of the clock even bytes are sampled.
- Data payload size is always a multiple of 2 Bytes.
- Two CRC16 are computed per data line
  - Odd bits CRC16 clocked on the falling edge of the clock.
  - Even bits CRC16 clocked on the rising edge of the clock.
- Start, end bits and idle conditions are full cycle.
- CRC status / boot acknowledgment and busy signaling are full cycle and are only sampled on the rising edge of the clock.

In DDR mode the SDMMC\_CK clock division must be  $\geq 2$ .

**Figure 680. DDR mode data packet clocking**

**Figure 681. DDR mode CRC status / boot acknowledgment clocking**

**Data path state machine (DPSM)**

Depending on the transfer direction (send or receive), the data path state machine (DPSM) moves to the Wait\_S or Wait\_R state when it is enabled:

- Send: the DPSM moves to the Wait\_S state. If there is data in the transmit FIFO, the DPSM moves to the Send state, and the data path subunit starts sending data to a card.
- Receive: the DPSM moves to the Wait\_R state and waits for a start bit. When it receives a start bit, the DPSM moves to the Receive state, and the data path subunit starts receiving data from a card.

For boot operation with acknowledgment the DPSM moves to the Wait\_Ack state and waits for the boot acknowledgment before moving to the Wait\_R state.

The DPSM operates at SDMMC\_CK. The DPSM has the following states, as shown in Figure 682. When ever the DPSM is active, i.e. not in the Idle state, the DPSSMACK bit is set.

Figure 682. Data path state machine (DPSM)

- Idle state:** the data path is inactive, and the SDMMC\_D[7:0] outputs are according the PWRCTRL setting. The DPSM is activated either by sending a command with CMDTRANS bit set or by setting the DTEN bit, or by detecting Busy on SDMMC\_D0 (that is, after a command with R1b response).

When not busy, the DPSM activates the SDMMC\_CK clock (when stopped due to power save PWRSAV bit), loads the data counter with a new (DATALENGTH) value and:

- When the data direction bit (DTDIR) indicates send, moves to the Wait\_S.
- When the data direction bit (DTDIR) indicates receive, moves to the
  - Wait\_R when BOOTACKEN register bit is clear.
  - Wait\_Ack when BOOTACKEN register bit is set and start the acknowledgment timeout.

When busy the DPSM keeps the SDMMC\_CK clock active and move to the Busy state.

Note: *DTEN must not be used to start data transfer with SD, SDIO and eMMC cards.*

- **Wait\_Ack** state: the data path waits for the boot acknowledgment token.
  - The DPSM moves to the Wait\_R state if it receives an error free acknowledgment before a timeout.
  - When a pattern different from the acknowledgment is received an acknowledgment status error is generated, and the ack fail status flag (ACKFAIL) is set. The DPSM stays in Wait\_Ack.
  - If it reaches a timeout (ACKTIME) before it detects a start bit, it sets the timeout status flag (ACKTIMEOUT). The DPSM stays in Wait\_Ack.
  - When the CPSM Abort signal is set it moves to the Idle state and sets the DABORT flag.
- **Wait\_R** state: the data path, if the data counter is not zero and data is not hold, waits for a start bit on SDMMC\_D[n:0]. If the data counter is zero or data is hold, wait for the FIFO to be empty.
  - In block mode, if a start bit is received before a timeout the DPSM moves to the Receive state and loads the data block counter with DBLOCKSIZE.
  - In SDIO multibyte mode, if a start bit is received before a timeout the DPSM moves to the Receive state and loads the data block counter with DATALENGTH.
  - In stream mode, if a start bit is received before a timeout the DPSM moves to the Receive state and loads the data counter with DATALENGTH.
  - if the data counter (DATACOUNT) equals zero (end of data) the DPSM moves to the Idle state when the receive FIFO is empty and the DATAEND flag is set.
  - If it reaches a timeout (DATETIME) before it detects a start bit, it sets the timeout status flag (DTIMEOUT) and the DPSM stays in the Wait\_R state.
  - If the CPSM Abort signal is set:
    - If DATACOUNT > 0, the DPSM moves to the Idle state when the FIFO is empty and when IDMAEN = 0 reset with FIFORST, and sets the DABORT flag.
    - If DATACOUNT is zero normal operation is continued, there is no DABORT flag since the transfer has completed normally.
  - if the DTHOLD bit is set:
    - When DATACOUNT > 0, the DPSM moves to the Idle state when the receive FIFO is empty and when IDMAEN = 0 reset with FIFORST, and issues the DHOLD flag. When holding the timeout is disabled. When an CPSM Abort signal is received during holding, the transfer is aborted.

- When DATACOUNT = 0, the transfer is completed normally and there is no DHOLD flag.
- When DPSM has been started with DTEN, after an error (DTIMEOUT) the DPSM moves to the Idle state when the FIFO is empty and when IDMAEN = 0 reset with FIFORST.
- **R\_W** state: the data path Read Wait the bus.
  - The DPSM moves to the Wait\_R state when the Read Wait stop bit (RWSTOP) is set, and start the receive timeout.
  - If the CPSM Abort signal is set, wait for the FIFO to be empty and when IDMAEN = 0 reset with FIFORST, then moves to the Idle state and sets the DABORT flag.
- **Receive** state: the data path receives serial data from a card. Pack the data in bytes and written it to the data FIFO. Depending on the transfer mode selected in the data control register (DTMODE), the data transfer mode can be either block or stream:
  - In block mode, when the data block size (DBLOCKSIZE) number of data bytes are received, the DPSM waits until it receives the CRC code.
  - In SDIO multibyte mode, when the data block size (DATALENGTH) number of data bytes are received, the DPSM waits until it receives the CRC code.
  - a) If the received CRC code matches the internally generated CRC code, the DPSM moves to the
    - R\_W state when RWSTART = 1 and DATACOUNT > zero, the DBCKEND flag is set.
    - Wait\_R state otherwise.
  - b) If the received CRC code fails the internally generated CRC code any further data reception is prevented.
    - When not all data has been received (DATACOUNT > 0), the CRC fail status flag (DCRCFAIL) is set and the DPSM stays in the Receive state.
    - When all data has been received (DATACOUNT = 0), wait for the FIFO to be empty after which the CRC fail status flag (DCRCFAIL) is set and the DPSM moves to the Idle state.
  - In stream mode, the DPSM receives data while the data counter DATACOUNT > 0. When the counter is zero, the remaining data in the shift register is written to the data FIFO, and the DPSM moves to the Wait\_R state.
  - When a FIFO overrun error occurs, the DPSM sets the FIFO overrun error flag (RXOVERR) and any further data reception is prevented. The DPSM stays in the Receive state.
  - When an CPSM Abort signal is received:
    - If the CPSM Abort signal is received before the 2 last bits of the data with DATACOUNT = 0, the transfer is aborted. The remaining data in the shift register is written to the data FIFO, wait for the FIFO to be empty and when IDMAEN = 0 reset with FIFORST, then the DPSM moves to the Idle state and the DABORT flag is set.
    - If the CPSM Abort signal is received during or after the 2 last bits of the transfer with DATACOUNT=0, the transfer is completed normally. The DPSM stays in the Receive state no DABORT flag is generated.
  - When DPSM has been started with DTEN, after an error (DCRCFAIL when DATACOUNT > 0, or RXOVERR) the DPSM moves to the Idle state when the FIFO is empty and when IDMAEN = 0 reset with FIFORST.

- **Wait\_S** state: the data path waits for data to be available from the FIFO.
  - If the data counter `DATACOUNT > 0`, waits until the data FIFO empty flag (`TXFIFOE`) is de-asserted and `DTHOLD` is not set, and moves to the Send state.
  - If the data counter (`DATACOUNT`) = 0 the DPSM moves to the Idle state.
    - When `DTHOLD` is disabled, the `DATAEND` flag is set.
    - When `DTHOLD` is enabled, the `DHOLD` flag is set.
  - When `DTHOLD` is set and the `DATACOUNT > 0`
    - When `IDMA` is enabled, the `DBCKEND` flag is set and subsequently the FIFO is flushed, furthermore the DPSM moves to the Idle state and the `DHOLD` flag is set.
    - When `IDMA` is disabled the `DBCKEND` flag is set. Wait for the FIFO to be reset by software with `FIFORST`, then DPSM moves to the Idle state and issues the `DHOLD` flag.
  - When `DTHOLD` is set and `DATACOUNT = 0` the transfer is completed normally.
  - When receiving the CPSM Abort signal
    - If the CPSM Abort signal is received before the 2 last bits of the data with `DATACOUNT = 0`, the transfer is aborted, wait for the FIFO to be empty and when `IDMAEN = 0` reset with `FIFORST`, then the DPSM moves to the Idle state and sets the `DABORT` flag.
    - If the CPSM Abort signal is received during or after the 2 last bits of the transfer with `DATACOUNT=0`, normal operation is continued, there is no `DABORT` flag since the transfer has completed normally.

*Note:* The DPSM remains in the `Wait_S` state for at least two clock periods to meet the  $N_{WR}$  timing requirements, where  $N_{WR}$  is the number of clock cycles between the reception of the card response and the start of the data transfer from the host.

- **Send** state: the DPSM starts sending data to a card. Depending on the transfer mode bit in the data control register, the data transfer mode can be either block, SDIO multibyte or stream:
  - In block mode, when the data block size (`DBLOCKSIZE`) number of data bytes are send, the DPSM sends an internally generated CRC code and end bit, and moves to the Busy state and start the transmit timeout.
  - In SDIO multibyte mode, when the data block size (`DATALENGTH`) number of data bytes are send, the DPSM sends an internally generated CRC code and end bit, and moves to the Busy state and start the transmit timeout.
  - In stream mode, the DPSM sends data to a card while the data counter `DATACOUNT > 0`. When the data counter reaches zero moves to the Busy state and start the transmit timeout.  
Before sending the last stream Byte according to `DATACOUNT`, the DPSM issues a trigger on the send `CMD` signal. This signal is used by the CPSM to sent any pending command. (i.e. `CMD12` Stop Transmission command)
  - If a FIFO underrun error occurs, the DPSM sets the FIFO underrun error flag (`TXUNDERR`). The DPSM stays in the Send state.
  - When receiving the CPSM Abort signal
    - If the CPSM Abort signal is received before the 2 last bits of the transfer with `DATACOUNT=0`, the transfer is aborted. The DPSM sends a last data bit followed by an end bit. The FIFO is disabled/flushed, and the DPSM moves to the Busy state to wait for not busy before setting the `DABORT` flag.
    - If the CPSM Abort signal is received during or after the 2 last bits of the transfer

with DATACOUNT=0, the transfer is completed normally, there is no DABORT flag.

- **Busy state:** the DPSM waits for the CRC status token when expected, and wait for a not busy signal:
  - If a CRC status token is expected and indicate “non-erroneous transmission” or when there is no CRC expected:
    - it moves to the Wait\_S state when SDMMC\_D0 is not low (the card is not busy).
    - When the card is busy SDMMC\_D0 is low it remains in the Busy state.
  - If a CRC status token is expected and indicates “erroneous transmission”.
    - When not all data has been send (DATACOUNT > 0). The DPSM waits for not busy after which the CRC fail status flag (DCRCFAIL) is set. The FIFO is disabled/flushed and the DPSM stays in the Busy state.
    - When all data has been send (DATACOUNT = 0). The DPSM waits for not busy after which the CRC fail status flag (DCRCFAIL) is set and the DPSM moves to the Idle state.
  - If a CRC status (Ncrc) timeout occurs while the DPSM is in the Busy state, it sets the data timeout flag (DTIMEOUT) and stays in the Busy state.
  - If a busy timeout occurs while the DPSM is in the Busy state, it sets the data timeout flag (DTIMEOUT) and stays in the Busy state.
  - When receiving the CPSM Abort signal in the Busy state:
    - If the CPSM Abort signal is received before the 2 last bits of the CRC response with DATACOUNT > 0, the data transfer is aborted. The DPSM waits for not busy and the FIFO to be disabled/flushed before moving to the Idle state and the DABORT flag is set.
    - If the CPSM Abort signal is received during or after the 2 last bits of the CRC response when DATACOUNT=0 or when no CRC is expected and DATACOUNT = 0 and there has been no DTIMEOUT error, the DPSM stays in the Busy state no DABORT flag is generated, since the transfer may completed normally.
    - If the CPSM Abort signal is received when a DTIMEOUT error has occurred the DPSM waits for not busy and the FIFO to be disabled/flushed before moving to the Idle state and the DABORT flag is set.
  - When entering the Busy state due to an abort in the Send state, the DPSM waits for not busy before moving to the Idle state and the DABORT flag is set.
  - When DPSM has been started with DTEN, after an error (DCRCFAIL when DATACOUNT > 0, or DTIMEOUT) the DPSM moves to the Idle state when the FIFO is reset.
  - When the DPSM has been started due to Busy on SDMMC\_D0, waits for not busy after which the Busy end status flag (BUSYD0END) is set and the DPSM moves to the Idle state.

The data timer (DATATIME) is enabled when the DPSM is in the Wait\_R or Busy state 2 cycles after the data block end bit, or data read command end bit, or R1b response, and generates the data timeout error (DTIMEOUT):

- When transmitting data, the timeout occurs
  - when a CRC status is expected and no start bit is received withing 8 SDMMC\_CK cycles, the DTIMEOUT flag is set.
  - when the Busy state takes longer than the programmed timeout period., the DTIMEOUT flag is set.
- When receiving data, the timeout occurs
  - when there is still data to be received DATACOUNT > 0 and no start bit is received before the programmed timeout period, the DTIMEOUT flag is set.
- After a R1b response, the timeout occurs
  - when the Busy state takes longer than the programmed timeout period., the DTIMEOUT flag is set.

When DATATIME = 0,

- In receive the start bit must be present 2 cycles after the data block end bit or data read command end bit.
- In transmit busy is timed out 2 cycles after the CRC token end bit or stream data end bit.
- After a R1b response busy is timed out 2 cycles after the response end bit.

Data can be transferred from the card to the host (transmit, send) or vice versa (receive). Data are transferred via the SDMMC\_Dn data lines, they are stored in a FIFO.

**Table 453. Data token format**

Description	Start bit	Data <sup>(1)</sup>	CRC16	End bit	DTMODE
Block data	0	(DBLOCKSIZE, DATALENGTH)	yes	1	00
SDIO multibyte	0	(DATALENGTH)	yes	1	01
eMMC stream	0	(DATALENGTH)	no	1	10

1. The total amount of data to transfer is given by DATALENGTH. Where for Block data the amount of data in each block is given by DBLOCKSIZE.

The data token format is selected with register bits DTMODE according.

The data path implements the status flags and associated clear bits shown in [Table 454](#):

**Table 454. Data path status flags and clear bits**

Flag		Description
DATAEND	TX	Set at the end of the complete data transfer when the CRC is OK and busy has finished and both DTHOLD = 0 and DATACOUNT = 0. (DPSM moves from Wait_S to Idle)
	RX	Set at the end of the complete data transfer when the CRC is OK and all data has been read. (DATACOUNT = 0 and FIFO is empty). (DPSM moves from Wait_R to Idle)
	Boot	

Table 454. Data path status flags and clear bits (continued)

Flag		Description
DCRCFAIL	TX	Set at the end of the CRC when FAIL and busy has finished. (DPSM stay in Busy when there is still data to send and wait for CPSM Abort) (DPSM moves from Busy to Idle when all data has been sent) or DPSM has been started with DTEN
	RX	Set at the end of the CRC when FAIL and FIFO is empty. (DPSM stays in Receive when there is still data to be received and wait for CPSM Abort) (DPSM moves from Receive to Idle when all data has been received or DPSM has been started with DTEN)
	Boot	
ACKFAIL	Boot	Set at the end of the boot acknowledgment when fail. (DPSM stays in Wait_Ack and wait for CPSM Abort)
DTIMEOUT	CMD R1b	Set after the command response no end of busy received before the timeout. (DPSM stays in Busy and wait for CPSM Abort)
	TX	Set when no CRC token start bit received within Ncrc, or no end of busy received before the timeout. (DPSM stays in Busy and wait for CPSM Abort) (When DPSM has been started with DTEN move to Idle) Note: The DCRCFAIL flag may also be set when CRC failed before the busy timeout.
	RX	Set when no start bit received before the timeout. (DPSM stays in Wait_R and wait for CPSM Abort) (When DPSM has been started with DTEN move to Idle)
ACKTIMEOUT	Boot	Set when no start bit received before the timeout. (DPSM stays in Wait_Ack and wait for CPSM Abort)
DBCKEND	TX	When DTHOLD = 1 and IDMAEN = 0: Set at the end of data block transfer when the CRC is OK and busy has finished, when data transfer is not complete (DATACOUNT > 0). (DPSM moves from Busy to Wait_S)
	RX	When RWSTART = 1: Set at the end of data block transfer when the CRC is OK, when data transfer is not complete (DATACOUNT > 0). (DPSM moves from Receive to R_W)
	Boot	
DHOLD	TX	When DTHOLD = 1: Set at the end of data block transfer when the CRC is OK and busy has finished. (DPSM moves from Wait_S to Idle)
	RX	When DTHOLD = 1: Set at the end of data block transfer when the CRC is OK and all data has been read (FIFO is empty), when data transfer is not complete (DATACOUNT > 0). (DPSM moves from Wait_R to Idle)
DABORT	CMD R1b	When CPSM Abort event has been sent by the CPSM and busy has finished. (DPSM moves from Busy to Idle)
	TX	
	RX	When CPSM Abort event has been sent by the CPSM before the 2 last bits of the transfer. (DPSM moves from any state to Idle)
	Boot	
BUSYD0END	CMD R1b	Set after the command response when end of busy before the timeout. (DPSM moves from Busy to Idle)
DPSMACT		Data transfer in progress. (DPSM not in Idle state)

The data path error handling is shown in [Table 455](#):

**Table 455. Data path error handling**

Error	DPSM state	Cause	Card action	Host action	DPSM action
Timeout	Wait_Ack	No Ack in time	unknown	Card cycle power	Stay in Wait_Ack (reset the SDMMC with the RCC.SDMMCxRST register bit)
	Wait_R	No start bit in time	unknown	Stop data reception Send stop transmission command	On CPSM Abort move to Idle
			unknown	Stop boot procedure	
	Busy	Busy too long (due to data transfer)	unknown	Stop data reception Send stop transmission command	
Busy too long (due to R1b)		unknown	Send reset command		
CRC	Receive	transmission error	Send further data	Stop data reception Send stop transmission command	On CPSM Abort move to Idle
CRC status	Busy	Negative status	Ignore further data	Stop data transmission Send stop transmission command	On CPSM Abort move to Idle
		transmission error	wait for further data		
Ack status	Wait_Ack	transmission error	Send boot data	Stop boot procedure	On CPSM Abort move to Idle
Overrun	Receive	FIFO full	Send further data	Stop data reception Send stop transmission command	On CPSM Abort move to Idle
Underrun	Send	FIFO empty	Receive further data	Stop data transmission Send stop transmission command	On CPSM Abort move to Idle

**Data FIFO**

The data FIFO (first-in-first-out) subunit contains the transmit and receive data buffer. A single FIFO is used for either transmit or receive as selected by the DTDIR bit. The FIFO contain a 32-bit wide, 16-word deep data buffer and control logic. Because the data FIFO operates in the AHB clock domain (sdmmc\_hclk), all signals from the subunits in the SDMMC clock domain (SDMMC\_CK/sdmmc\_rx\_ck) are resynchronized.

The FIFO can be in one of the following states:

- The transmit FIFO refers to the transmit logic and data buffer when sending data out to the card. (DTDIR = 0)
- The receive FIFO refers to the receive logic and data buffer when receiving data in from the card. (DTDIR = 1)

The end of a correctly completed SDMMC data transfer from the FIFO is indicated by the DATAEND flags driven by the data path subunit. Any incorrect (aborted) SDMMC data transfer from the FIFO is indicated by one of the error flags (DCRCFAIL, DTIMEOUT, DABORT) driven by the data path subunit, or one of the FIFO error flags (TXUNDERR, RXOVERR) driven by the FIFO control.

The data FIFO can be accessed in the following ways, see [Table 456](#).

**Table 456. Data FIFO access**

Data FIFO access	IDMAEN
From firmware via AHB slave interface	0
From IDMA via AHB master interface	1

Transmit FIFO:

Data can be written to the transmit FIFO when the DPSM has been activated (DPSMACT = 1).

When IDMAEN = 1 the FIFO is fully handled by the IDMA.

When IDMAEN = 0 the FIFO is controlled by firmware via the AHB slave interface. The transmit FIFO is accessible via sequential addresses. The transmit FIFO contains a data output register that holds the data word pointed to by the read pointer. When the data path subunit has loaded its shift register, it increments the read pointer and drives new data out. The transmit FIFO is handled in the following way:

1. Write the data length into DATALENGTH and the block length in DBLOCKSIZE.
  - For block data transfer (DTMODE = 0), DATALENGTH must be an integer multiple of DBLOCKSIZE.
2. Set the SDMMC in transmit mode (DTDIR = 0).
  - Configures the FIFO in transmit mode.
3. Enable the data transfer
  - either by sending a command from the CPSM with the CMDTRANS bit set
  - or by setting DTEN bit
4. When (DPSMACT = 1) write data to the FIFO.
  - The DPSM stays in the Wait\_S state until FIFO is full (TXFIFO = 1), or the number indicated by DATALENGTH.

- The SDMMC keeps sending data as long as FIFO is not empty, hardware flow control during data transfer is used to prevent FIFO underrun.

5. Write data to the FIFO.
  - When the FIFO is handled by software, wait until the FIFO is half empty (TXFIFOHE flag), write data to the FIFO until FIFO is full (TXFIFO = 1), or last data has been written.
  - When the FIFO is handled by the IDMA, the IDMA transfers the FIFO data.
6. When last data has been written wait for end of data (DATAEND flag)
  - SDMMC has completely sent all data and the DPSM is disabled (DPSMACT = 0).

In case of a data transfer error or transfer hold when IDMAEN = 0, firmware must stop writing to the FIFO and flush and reset the FIFO with the FIFORST register bit.

The transmit FIFO status flags are listed in [Table 457](#).

**Table 457. Transmit FIFO status flags**

Flag	Description
TXFIFO	Set to high when all transmit FIFO words contain valid data.
TXFIFOE	Set to high when the transmit FIFO does not contain valid data.
TXFIFOHE	Set to high when half or more transmit FIFO words are empty.
TXUNDERR	Set to high when an underrun error occurs. This flag is cleared by writing to the SDMMC Clear register.

Receive FIFO:

Data can be read from the receive FIFO when the DPSM is activated (DPSMACT = 1).

When IDMAEN = 1 the FIFO is fully handled by the IDMA.

When IDMAEN = 0 the FIFO is controlled by firmware via the AHB slave interface. When the data path subunit receives a word of data, it drives the data on the write databus. The write pointer is incremented after the write operation completes. On the read side, the contents of the FIFO word pointed to by the current value of the read pointer is driven onto the read databus. The receive FIFO is accessible via sequential addresses.

The receive FIFO is handled in the following way:

1. Write the data length into DATALENGTH and the block length in DBLOCKSIZE.
  - For block data transfer (DTMODE = 0), DATALENGTH must be an integer multiple of DBLOCKSIZE.
2. Set the SDMMC in receive mode (DTDIR = 1).
  - Configures the FIFO in receive mode.
3. Enable the DPSM transfer
  - either by sending a command from the CPSM with the CMDTRANS bit set
  - or by setting DTEN bit.
4. When (DPSMACT = 1) the FIFO is ready to receive data.
  - The DPSM writes the received data to the FIFO.
    - The SDMMC keeps receiving data as long as FIFO is not full, hardware flow control during the data transfer is used to prevent FIFO overrun.
5. Read data from the FIFO.
  - When the FIFO is handled by software, wait until the FIFO is half full (RXFIFOHF flag), read data from the FIFO until FIFO is empty (RXFIFOE = 1).
    - When last data has been received, read data from the FIFO until FIFO is empty (DATAEND = 1).
  - When the FIFO is handled by the IDMA, the IDMA transfers the FIFO data.
6. SDMMC has completely received all data and the DPSM is disabled (DPSMACT = 0).

In case of a data transfer hold when IDMAEN = 0, the firmware must read the remaining data until the FIFO is empty and reset the FIFO with the FIFORST register bit. This causes the DPSM to go to the Idle state (DPSMACT = 0).

In case of a data transfer error when IDMAEN = 0, the firmware must stop reading the FIFO and flush and reset the FIFO with the FIFORST register bit. This causes the DPSM to go to the Idle state (DPSMACT = 0).

The receive FIFO status flags are listed in [Table 458](#).

**Table 458. Receive FIFO status flags**

Flag	Description
RXFIFOV	Set to high when all receive FIFO words contain valid data
RXFIFOE	Set to high when the receive FIFO does not contain valid data.
RXFIFOHF	Set to high when half or more receive FIFO words contain valid data.
RXOVERR	Set to high when an overrun error occurs. This flag is cleared by writing to the SDMMC Clear register.

### CLKMUX unit

The CLKMUX selects the source for clock `sdmmc_rx_ck` to be used with the received data and command response. The receive data clock source can be selected by the clock control register bit `SELCLKRX`, between:

- `sdmmc_io_in_ck` bus master main feedback clock.
- `SDMMC_CKIN` external bus feedback clock.
- `sdmmc_fb_ck` bus tuned feedback clock.

The `sdmmc_io_in_ck` is selected when there is no external driver, with DS and HS.

The SDMMC\_CKIN is selected when there is an external driver with SDR12, SDR25, SDR50 and DDR50.

The sdmmc\_fb\_ck clock input must be selected when the DLYB block on the device is used with SDR104, HS200 and optionally with SDR50 and DDR50 modes.

Figure 683. CLKMUX unit

The sdmmc\_rx\_ck source must be changed when the CPSM and DPSM are in the Idle state.

### 60.5.5 SDMMC AHB slave interface

The AHB slave interface generates the interrupt requests, and accesses the SDMMC adapter registers and the data FIFO. It consists of a data path, register decoder, and interrupt logic.

#### SDMMC FIFO

The FIFO access is restricted to word access only:

- In transmit FIFO mode
  - Data are written to the FIFO in words (32-bits) until all data according DATALENGTH has been transferred. When the DATALENGTH is not an integer multiple of 4, the last remaining data (1, 2 or 3 bytes) are written with a word transfer.
- In receive FIFO mode
  - Data are read from the FIFO in words (32-bits) until all data according DATALENGTH has been transferred. When the DATALENGTH is not an integer multiple of 4, the last remaining data (1, 2 or 3 bytes) are read with a word transfer padded with 0 value bytes.

When accessing the FIFO with half word or byte accesses an AHB bus fault is generated.

#### SDMMC interrupts

The interrupt logic generates an interrupt request signal that is asserted when at least one of the unmasked status flags is active. A mask register is provided to allow selection of the conditions that generate an interrupt. A status flag generates the interrupt request if a corresponding mask flag is set. Some status flags require an implicit clear in the clear register.

### 60.5.6 SDMMC AHB master interface

The AHB master interface is used to transfer the data between a memory and the FIFO using the SDMMC IDMA.

## SDMMC IDMA

Direct memory access (DMA) is used to provide high-speed transfer between the SDMMC FIFO and the memory. The AHB master optimizes the bandwidth of the system bus. The SDMMC internal DMA (IDMA) provides one channel to be used either for transmit or receive.

The IDMA is enabled by the IDMAEN bit and supports burst transfers of 8 beats.

- In transmit burst transfer mode:
  - Data are fetched in burst from memory whenever the FIFO is empty for the number of burst transfers, until all data according DATALENGTH has been transferred. When the DATALENGTH is not an integer multiple of the burst size the remaining, smaller than burst size data is transferred using single transfer mode. When the DATALENGTH is not an integer multiple of 4, the last remaining data (1, 2 or 3 bytes) are fetched with a word transfer.
- In receive burst transfer mode:
  - Data are stored in burst in to memory whenever the FIFO contains the number of burst transfers, until all data according DATALENGTH has been transferred. When the DATALENGTH is not an integer multiple of the burst transfer the remaining, smaller than burst size data, is transferred using single transfer mode. When the DATALENGTH is not an integer multiple of 4, the last remaining data (1, 2 or 3 bytes) are stored with halfword and or byte transfers.

In addition the IDMA provides the following channel configurations selected by bit IDMABMODE:

- single buffered channel
- double buffered channel

### Single buffered channel

In single buffer configuration the data at the memory side is accessed in a linear matter starting from the base address IDMABASE0. When the IDMA has finished transferring all data the and the DPSM has completed the transfer the DATAEND flag is set.

### Double buffered channel

In double buffer configuration the data at the memory side is subsequently accessed from 2 buffers, one located from base address IDMABASE0 and a second located from base address IDMABASE1. This allows firmware to process one memory buffer while the IDMA is accessing the other memory buffer. The size of the memory buffers is defined by IDMABSIZE. The buffer size must be an integer multiple of the burst size. It is possible to update the base address of the buffers on-the-fly when the channel is enabled, the following rule apply:

- When IDMABACT bit is '0' the IDMA hardware uses the IDMABASE0 to access memory. When attempting to write to this register by Firmware the write is discarded, IDMABASE0 data is not changed. Firmware is authorized to write IDMABASE1.
- When IDMABACT bit is '1' the IDMA hardware uses the IDMABASE1 to access memory. When attempting to write to this register by Firmware the write is discarded, IDMABASE1 data is not changed. Firmware is authorized to write IDMABASE0.

When the IDMA has finished transferring the data of one buffer the buffer transfer complete flag (IDMABTC) is set and the IDMABACT bit toggles where after the IDMA continues

transferring data from the other buffer. When the IDMA has finished transferring all data and the DPSM has completed the transfer the DATAEND flag is set.

The IDMABASEn address must be word aligned.

### IDMA transfer error management

An IDMA transfer error can occur:

- When reading or writing a reserved address space.

On a IDMA transfer error subsequent IDMA transfers are disabled and an IDMATE flag is set. Depending when the IDMA transfer error occurs, it normally causes the generation of a TXUNDERR or RXOVERR error.

The behavior of the IDMATE flag depend on when the IDMA transfer error occurs during the SDMMC transfer:

- An IDMA transfer error is detected before any SDMMC transfer error (TXUNDERR, RXOVERR, DCRCFAIL, or DTIMEOUT):
  - The IDMATE flag is set at the same time as the SDMMC transfer error flag.
  - The TXUNDERR, RXOVERR, DCRCFAIL, or DTIMEOUT interrupt is generated.
- An IDMA transfer error is detected during a STOP\_TRANSMISSION command:
  - The IDMATE flag is set at the same time as the DABORT flag.
  - The DABORT interrupt is generated.
- An IDMA transfer error is detected at the end of the SDMMC transfer (DHOLD, or DATAEND).
  - The IDMATE flag is set at the end of the SDMMC transfer.
  - A SDMMC transfer end interrupt is generated and a DHOLD or DATAEND flag is set.

The IDMATE is generated on an other SDMMC transfer interrupt (TXUNDERR, RXOVERR, DCRCFAIL, DTIMEOUT, DABORT, DHOLD, or DATAEND).

## 60.5.7 MDMA request generation

The internal trigger lines from the SDMMC allow passing direct request to MDMA controller to enable successive transfers from/to different internal RAM addresses without CPU use.

When a data transfer from/to the card completes successfully, the DATAEND flag of the status register is set. The event is signaled to an MDMA request input through the `sdmmc_dataend_trg` output. It can trigger the clearance of the DATAEND and CMDREND flags and, eventually, a new transfer start, through MDMA direct access to the SDMMC control and configuration registers, thus without CPU intervention.

When a command response is received successfully, the CMDREND flag of the status register is set. When a busy state following an R1b response ends, the BUSYD0 flag of the status register falls down and the BUSYD0END flag rises. The `sdmmc_cmdend_trg` output connected to the MDMA is set when the sequence command response associated with an eventual busy signal ends. In this way, the MDMA can manage STOP\_TRANSMISSION command (needed to support open mode transfers) by clearing CMDREND and BUSYD0END status flags.

When using LINUX operating system, data to be transferred through SDMMC bus are contained in separate 1- to 4-Kbyte blocks of the device internal memory at non-consecutive addresses. The double buffer mode allows changing the address targeted by the IDMA in

the internal memory. Each time a buffer transfer is completed, the IDMABTC flag of the status register is set. By signaling this event to MDMA through the sdmmc\_buffend\_trg output connected to an MDMA request input, the new buffer address base can alternatively fill the IDMABASE0 / IDMABASE1 fields without CPU intervention.

The actions to program in the MDMA according to the SDMMC requests are provided in the following table:

**Table 459. SDMMC connections to MDMA**

Trigger signal	Event signaled	Event occurrence condition	MDMA transfer configuration	MDMA action
sdmmc_dataend_trg	End of successful data transfer	DATAEND = 1	single	Set DATAENDC
sdmmc_cmdend_trg	End of command sequence	CMDSENT = 1, or (CMDREND = 1 and BUSYD0 = 0)	single	Set CMDSENTC Set CMDRENDC Set BUSYD0ENDC
sdmmc_buffend_trg	End of buffer reached	IDMABTC = 1	link list	Set IDMABTCC Update IDMABASE0/1

### 60.5.8 AHB and SDMMC\_CK clock relation

The AHB must at least have 3x more bandwidth than the SDMMC bus bandwidth i.e. for SDR50 4-bit mode (50 Mbyte/s) the minimum sdmmc\_hclk frequency is 37.5 MHz (150 Mbyte/s).

**Table 460. AHB and SDMMC\_CK clock frequency relation**

SDMMC bus mode	SDMMC bus width	Maximum SDMMC_CK [MHz]	Minimum AHB clock [MHz]
eMMC DS	8	26	19.5
eMMC HS	8	52	39
eMMC DDR52	8	52	78
eMMC HS200	8	200	150
SD DS / SDR12	4	25	9.4
SD HS / SDR25	4	50	18.8
SD DDR50	4	50	37.5
SD SDR50	4	100	37.5
SD SDR104	4	208	78

## 60.6 Card functional description

### 60.6.1 SD I/O mode

The following features are SDMMC specific operations:

- SDIO interrupts
- SDIO suspend/resume operation (write and read suspend)
- SDIO Read Wait operation by stopping the clock
- SDIO Read Wait operation by SDMMC\_D2 signaling

**Table 461. SDIO special operation control**

Operation mode	SDIOEN	RWMOD	RWSTOP	RWSTART	DTDIR
Interrupt detection	1	X	X	X	X
Suspend/Resume operation	X	X	X	X	X
Read Wait SDMMC_CK clock stop (START)	X	1	0	1	1
Read Wait SDMMC_CK clock stop (STOP)	X	1	1	1	1
Read Wait SDMMC_D2 signaling (START)	X	0	0	1	1
Read Wait SDMMC_D2 signaling (STOP)	X	0	1	1	1

#### SD I/O interrupts

To allow the SD I/O card to interrupt the host, an interrupt function is available on pin 8 (shared with SDMMC\_D1 in 4-bit mode) on the SD interface. The use of the interrupt is optional for each card or function within a card. The SD I/O interrupt is level-sensitive, which means that the interrupt line must be held active (low) until it is either recognized and acted upon by the host or deasserted due to the end of the interrupt period. After the host has serviced the interrupt, the interrupt status bit is cleared via an I/O write to the appropriate bit in the SD I/O card internal registers. The interrupt output of all SD I/O cards is active low and the application must provide external pull-up resistors on all data lines (SDMMC\_D[3:0]).

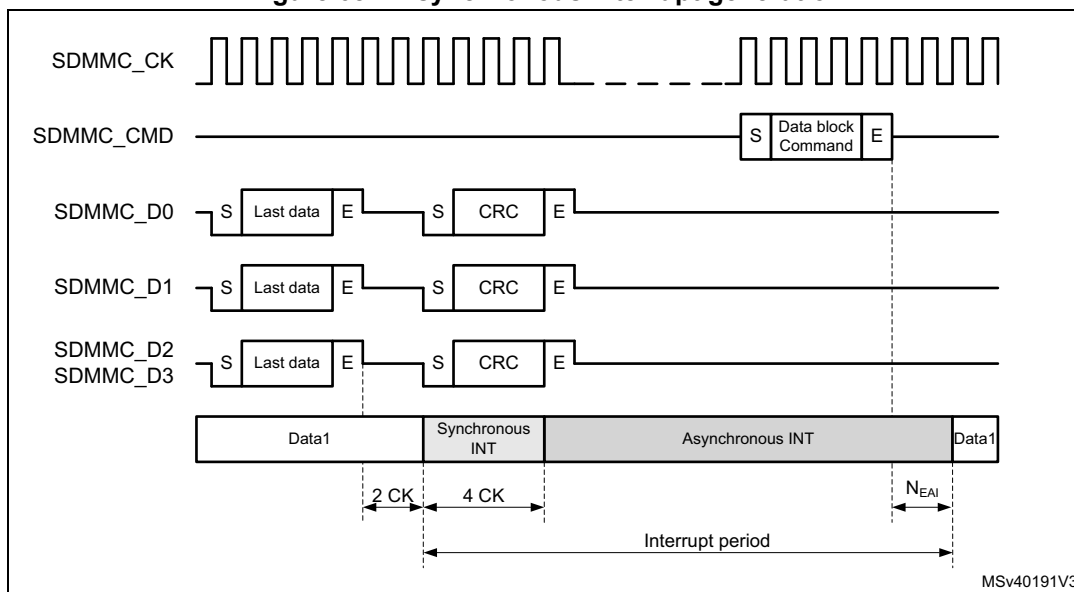

In SD 1-bit mode pin 8 is dedicated to the interrupt function (IRQ), and there are no timing constraints on interrupts.

In SD 4-bit mode the host samples the level of pin 8 (SDMMC\_D1/IRQ) into the interrupt detector only during the interrupt period. At all other times, the host interrupt ignores this value. The interrupt period begins when interrupts are enabled at the card and SDIOEN bit is set see register settings in [Table 461](#).

In 4-bit mode the card can generate a synchronous or asynchronous interrupt as indicated by the card CCCR register SAI and EAI bits.

- Synchronous interrupt, require the SDMMC\_CK to be active.
- Asynchronous interrupt, can be generated when the SDMMC\_CK is stopped, 4 cycles after the start of the card interrupt period following the last data block.

Figure 684. Asynchronous interrupt generation

The timing of the interrupt period is depended on the bus speed mode:

In DS, HS, SDR12, and SDR25 mode, selected by register bit BUSPEED, the interrupt period is synchronous to the SD clock.

- The interrupt period ends at the next clock from the end bit of a command that transfers data block(s) (Command sent with the CMDTRANS bit is set), or when the DTEN bit is set.
- The interrupt period resumes 2 SDMMC\_CK after the completion of the data block.
- At the data block gap the interrupt period is limited to 2 SDMMC\_CK cycles.

Note: DTEN must not be used to start data transfer with SD and eMMC cards.

Figure 685. Synchronous interrupt period data read

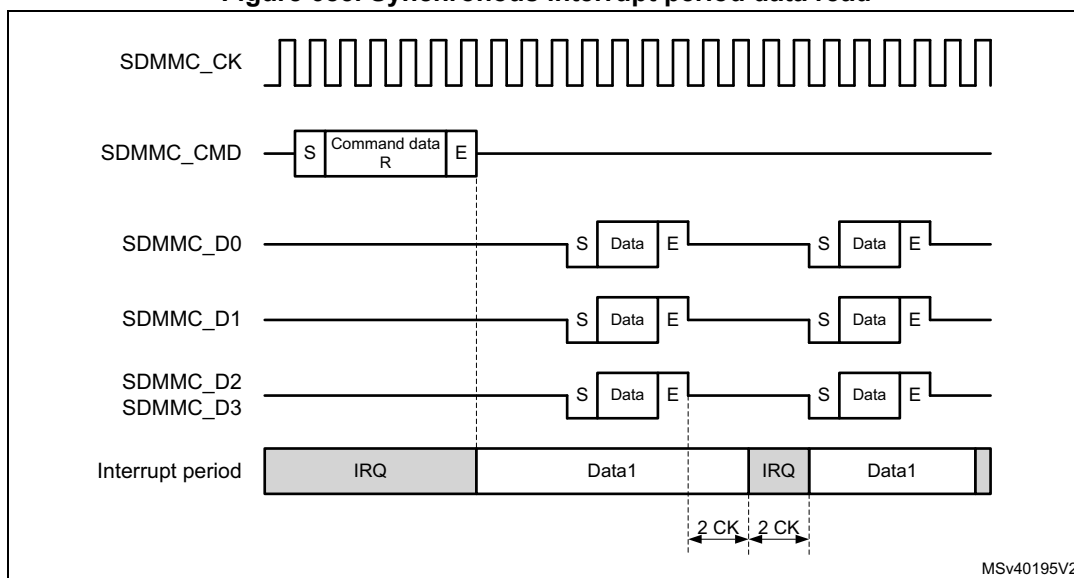

Figure 686. Synchronous interrupt period data write

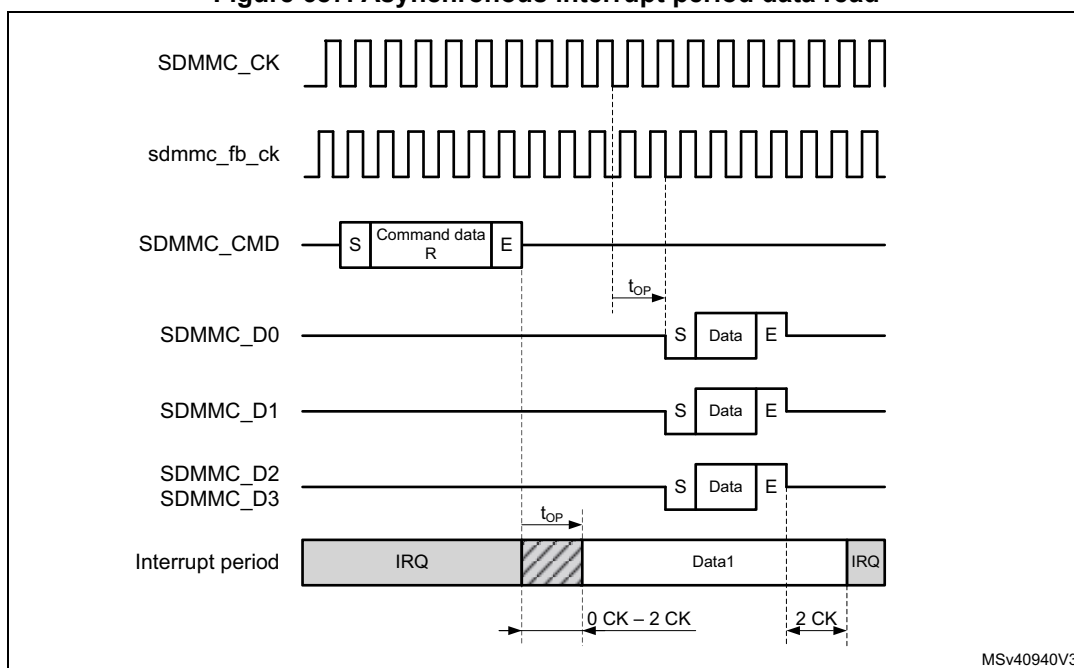

MSv40196V2

In SDR50, SDR104, and DDR50, selected by register bit BUSSPEED, due to propagation delay from the card to host, the interrupt period is asynchronous.

- The card interrupt period ends after 0 to 2 SDMMC\_CK cycles after the end bit of a command that transfers data block(s) (Command sent with the CMDTRANS bit is set), or when the DTEN bit is set. At the host the interrupt period ends after the end bit of a command that transfers data block(s). A card interrupt issued in the 1 to 2 cycles after the command end bit are not detected by the host during this interrupt period.
- The card interrupt period resumes 2 to 4 SDMMC\_CK after the completion of the last data block. The host resumes the interrupt period always 2 cycles after the last data block.
- There is NO interrupt period at the data block gap.

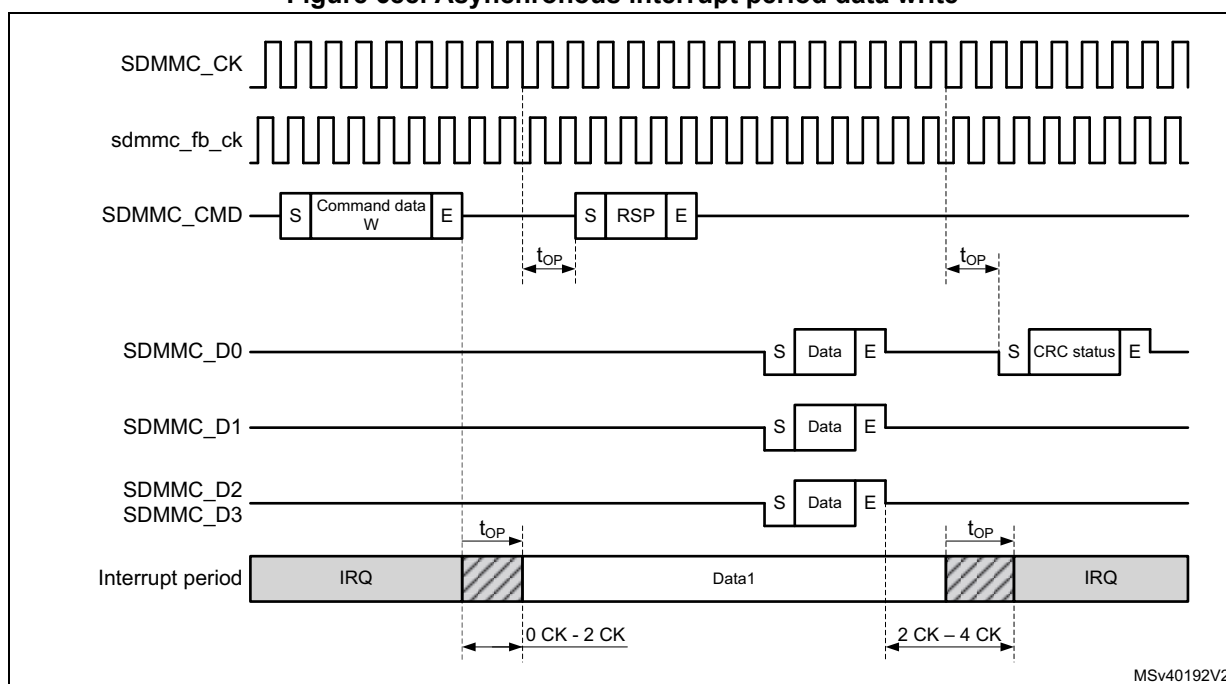

Note: DTEN must not be used to start data transfer with SD and eMMC cards.

Figure 687. Asynchronous interrupt period data read

MSv40940V3

Figure 688. Asynchronous interrupt period data write

MSv40192V2

When transferring Open-ended multiple block data and using DTMODE “block data transfer ending with STOP\_TRANSMISSION command”, the SDMMC masks the interrupt period after the last data block until the end of the CMD12 STOP\_TRANSMISSION command.

The interrupt period is applicable for both memory and I/O operations.

In 4-bit mode interrupts can be differentiated from other signaling according [Table 462](#).

**Table 462. 4-bit mode Start, interrupt, and CRC-status Signaling detection**

SDMMC data line	Start	Interrupt	CRC-status
SDMMC_D0	0	1 or CRC-status	0
SDMMC_D1	0	0	X
SDMMC_D2	0	1 or Read Wait	X
SDMMC_D3	0	1	X

### SD I/O suspend and resume

This function is NOT supported in SDIO version 4.00 or later.

Within a multifunction SD I/O or a card with both I/O and memory functions, there are multiple devices (I/O and memory) that share access to the eMMC/SD bus. To share access to the host among multiple devices, SD I/O and combo cards optionally implement the concept of suspend/resume. When a card supports suspend/resume, the host can temporarily halt (suspend) a data transfer operation to one function or memory to free the bus for a higher-priority transfer to a different function or memory. After this higher-priority transfer is complete, the original transfer is restarted (resume) where it left off.

To perform the suspend/resume operation on the bus, the host performs the following steps:

1. Determines the function currently using the SDMMC\_D[3:0] line(s)
2. Requests the lower-priority or slower transaction to suspend
3. Waits for the transaction suspension to complete
4. Begins the higher-priority transaction
5. Waits for the completion of the higher priority transaction
6. Restores the suspended transaction

The card receiving a suspend command responds with its current bus status. Only when the bus has been suspended by the card the bus status indicates suspension completed.

There are different suspend cases conditions:

- Suspend request accepted prior to the start of data transfer.
- Suspend request not accepted, (due to data being transferred at the same time), the host keeps checking the request until it is accepted. (data transfer has suspended)
- Suspend request during write busy.
- Suspend request with write multiple.
- Suspend request during Read Wait.

For the host to know if the bus has been released it must check the status of the suspend request, suspension completed.

When the bus status of the suspend request response indicates suspension completed, the card has released the bus. At this time the state of the suspended operation must be saved where after an other operation can start.

The suspend command must be sent with the CMDSPEND bit set. This makes possible to start the interrupt period after the suspend command response when the bus is suspended (response bit BS = 0).

The hardware does not save the number of remaining data to be transferred when resuming the suspended operation. It is up to firmware to determine the data that has been transferred and resume with the correct remaining number of data bytes.

While receiving data from the card, the SDMMC can suspend the read operation after the read data block end (DPSM in Wait\_R). After receiving the suspend acknowledgment response from the card the following steps must be taken by firmware:

1. The normal receive process must be stopped by setting DTHOLD bit.
  - a) The remaining number of data bytes in the FIFO must be read until the receive FIFO is empty (RXFIFOE flag is set), and when IDMAEN = 0 the FIFO must be reset with FIFORST.
2. The confirmation that all data has been read from the FIFO, and that the suspend is completed is indicated by the DHOLD flag.
  - a) The remaining number of data bytes (multiple of data blocks) still to be read when resuming the operation must be determined from the remaining number of bytes indicated by the DATACOUNT.

*Note: When a DTIMEOUT flag occurs during the suspend procedure, this must be ignored.*

To resume receiving data from the card, the following steps must be taken by firmware:

1. The remaining number of data bytes (multiple of data blocks) must be programmed in DATALENGTH.
2. The DPSM must be configured to receive data in the DTDIR bit.
3. The resume command must be sent from the CPSM, with the CMDTRANS bit set and the CMDSUSPEND bit set, which ends the interrupt period when data transfer is resumed (response bit DF = 1) and enabled the DPSM, after which the card resumes sending data.

While sending data to the card, the SDMMC can suspend the write operation after the write data block CRC status end (DPSM in Busy). Before sending the suspend command to the card the following steps must be taken by firmware:

1. Enable DHOLD flag (and DBCKEND flag when IDMAEN = 0)
2. The DPSM must be prevented from start sending a new data block by setting DTHOLD.
3. When IDMAEN = 0: When receiving the DBCKEND flag the data transfer is stopped. Firmware can stop filling the FIFO, after which the FIFO must be reset with FIFORST. Any bytes still in the FIFO need to be rewritten when resuming the operation.
4. When receiving the DHOLD flag the data transfer is stopped. The remaining number of data bytes still to be written when resuming must be determined from the remaining number of bytes indicated by the DATACOUNT.
5. To suspend the card the suspend command must be sent by the CPSM with the CMDSUSPEND bit set. This makes possible to start the interrupt period after the suspend command response when the bus is suspended (response bit BS = 0).

To resume sending data to the card, the following steps must be taken by firmware:

1. The remaining number of data bytes must be programmed in DATALENGTH.
2. The DPSM must be configured for transmission with DTDIR set and enabled by having the CPSM send the resume command with the CMDTRANS bit set and the CMDSUSPEND bit set. This ends the interrupt period and start the data transfer. The

DPSM either goes to the Wait\_S state when SDMMC\_D0 does not signal busy, or goes to the Busy state when busy is signaled.

3. When IDMAEN = 1: The IDMA needs to be reprogrammed for the remaining bytes to be transferred.
4. When IDMAEN = 0: Firmware must start filling the FIFO with the remaining data.

**SD I/O Read Wait**

There are 2 methods to pause the data transfer during the Block gap:

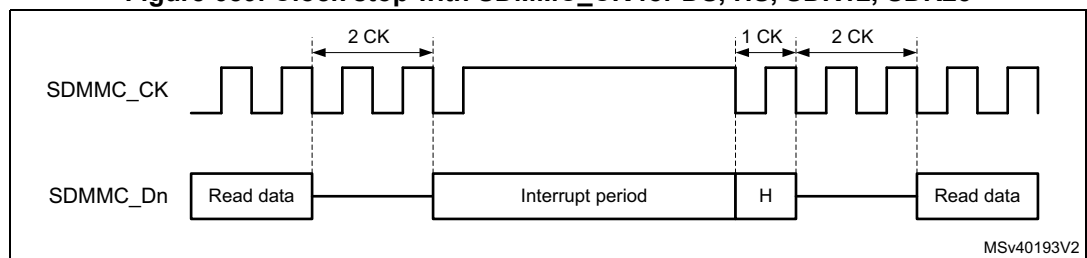

1. Stopping the SDMMC\_CK.
2. Using Read Wait signaling on SDMMC\_D2.

The SDMMC can perform a Read Wait with register settings according [Table 461](#).

Depending the SDMMC operation mode (DS, HS, SDR12, SDR25) or (SDR50, SDR104, DDR) each method has a different characteristic.

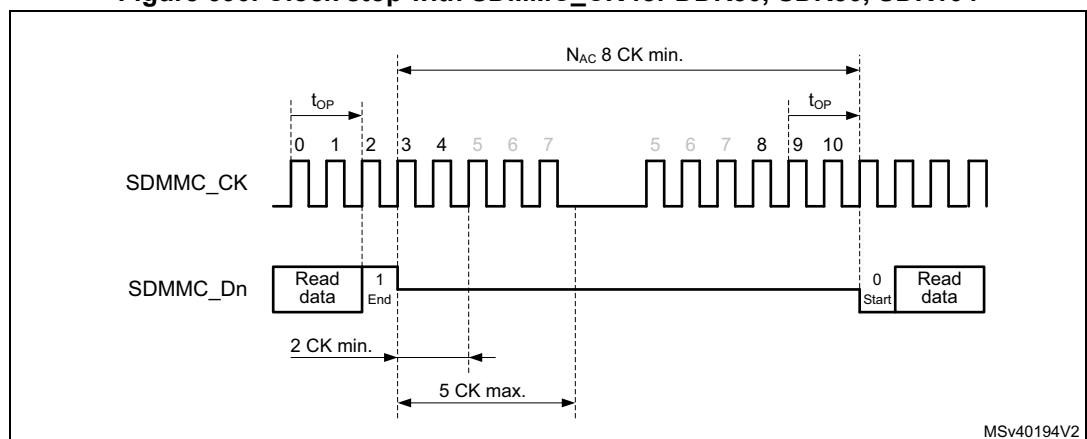

The timing for pause read operation by stopping the SDMMC\_CK for DS, HS, SDR12, and SDR25, the SDMMC\_CK may be stopped 2 SDMMC\_CK cycles after the end bit. When ready the host resumes by restarting clock, see [Figure 689](#).

**Figure 689. Clock stop with SDMMC\_CK for DS, HS, SDR12, SDR25**

The timing for pause read operation by stopping the SDMMC\_CK for SDR50, SDR104, and DDR50, the SDMMC\_CK may be stopped minimum 2 SDMMC\_CK cycles and maximum 5 SDMMC\_CK cycles, after the end bit. When ready the host resumes by restarting clock, see [Figure 690](#). (In DDR50 mode the SDMMC\_CK must only be stopped after the falling edge, when the clock line is low.)

**Figure 690. Clock stop with SDMMC\_CK for DDR50, SDR50, SDR104**

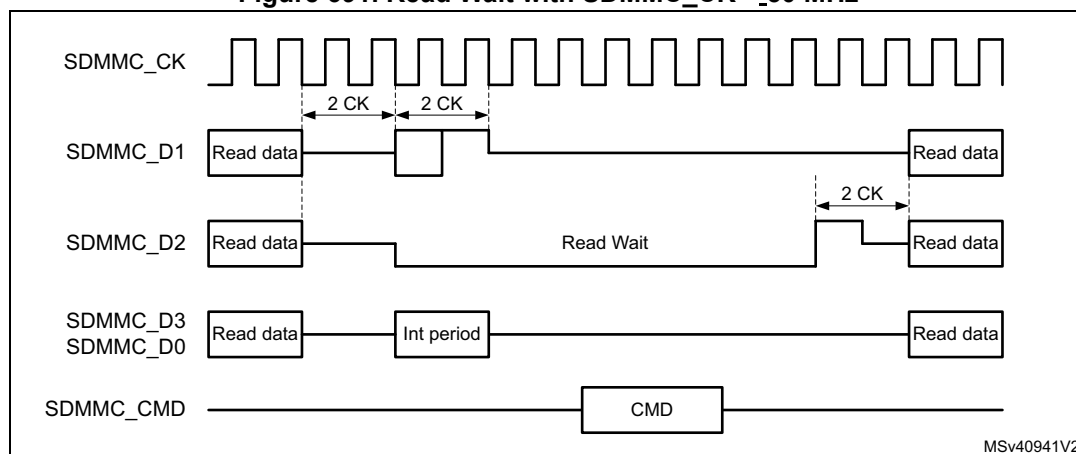

In Read Wait SDMMC\_CLK clock stopping, when RWSTART is set, the DSPM stops the clock after the end bit of the current received data block CRC. The clock start again after writing 1 to the RWSTOP bit, where after the DSPM waits for a start bit from the card.

As SDMMC\_CLK is stopped, no command can be issued to the card. During a Read Wait interval, the SDMMC can still detect SDIO interrupts on SDMMC\_D1.

The optional Read Wait signaling on SDMMC\_D2 (RW) operation is defined only for the SD 1-bit and 4-bit modes. The Read Wait operation enables the host to signal a card that is reading multiple registers (IO\_RW\_EXTENDED, CMD53) to temporarily stall the data transfer while allowing the host to send commands to any function within the SD I/O device. To determine when a card supports the Read Wait protocol, the host must test capability bits in the internal card registers.

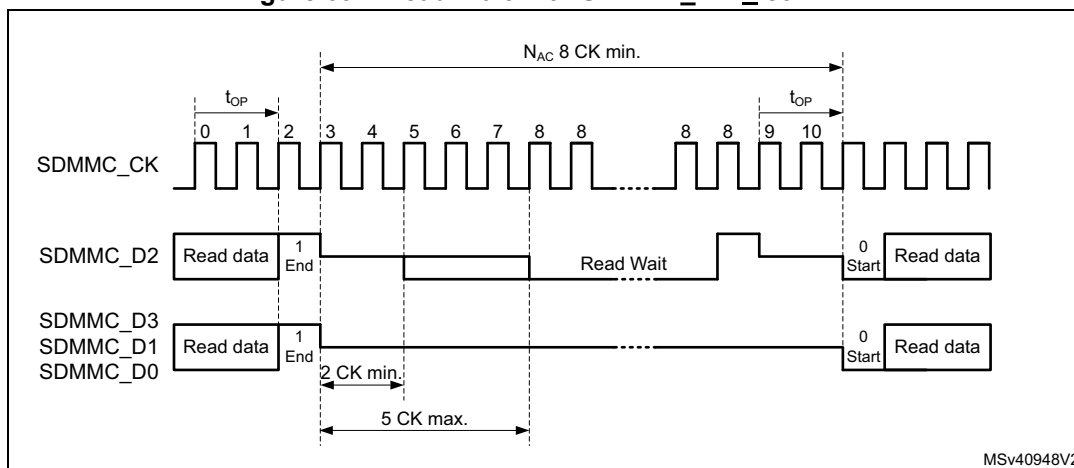

The timing for Read Wait with a SDMMC\_CLK less then 50MHz (DS, HS, SDR12, SDR25) is based on the interrupt period generated by the card on SDMMC\_D1. The host by asserting SDMMC\_D2 low during the interrupt period requests the card to enter Read Wait. To exit Read Wait the host must raise SDMMC\_D2 high during one SDMMC\_CLK cycles before making it Hi-Z, see [Figure 691](#).

**Figure 691. Read Wait with SDMMC\_CLK < 50 MHz**

For SDR50, SDR104 with a SDMMC\_CLK more than 50MHz, and DDR50, the card treats the Read Wait request on SDMMC\_D2 as an asynchronous event. The host by asserting SDMMC\_D2 low after minimum 2 SDMMC\_CLK cycles and maximum 5 SDMMC\_CLK cycles, request the card to enter Read Wait. To exit Read Wait the host must raise SDMMC\_D2 high during one SDMMC\_CLK cycles before making it Hi-Z. The host must raise SDMMC\_D2 on the SDMMC\_CLK clock (see [Figure 692](#)).

Figure 692. Read Wait with SDMMC\_CK ≥ 50 MHz

In Read Wait SDMMC\_D2 signaling, when RWSTART is set, the DPSM drives SDMMC\_D2 after the end bit of the current received data block CRC. The Read Wait signaling on SDMMC\_D2 is removed when writing 1 to the RWSTOP bit. The DPSM remains in R\_W state for two more SDMMC\_CK clock cycles to drive SDMMC\_D2 to 1 for one clock cycle (in accordance with SDIO specification), where after the DPSM waits for a start bit from the card.

During the Read Wait signaling on SDMMC\_D2 commands can be issued to the card. During the Read Wait interval, the SDMMC can detect SDIO interrupts on SDMMC\_D1.

### 60.6.2 CMD12 send timing

CMD12 is used to stop/abort the data transfer, the card data transmission is terminated two clock cycles after the end bit of the Stop Transmission command.

Table 463. CMD12 use cases

Data operation	Stop Transmission command CMD12 Description
SDMMC stream write	The data transfer is stopped/aborted by sending the Stop Transmission command.
SDMMC open ended multiple block write	The data transfer is stopped/aborted by sending the Stop Transmission command. If the card detects an error, the host must abort the operation by sending the Stop Transmission command.
SDMMC block write with predefined block count	The Stop Transmission command is not required at the end of this type of multiple block write. (sending the Stop Transmission command after the card has received the last block is regarded as an illegal command.) If the card detects an error, the host must abort the operation by sending the Stop Transmission command.
SDMMC stream read	The data transfer is stopped/aborted by sending the Stop Transmission command.

Table 463. CMD12 use cases (continued)

Data operation	Stop Transmission command CMD12 Description
SDMMC open ended multiple block read	The data transfer is stopped/aborted by sending the Stop Transmission command. If the card detects an error, the host must abort the operation by sending the Stop Transmission command.
SDMMC block read with predefined block count	The Stop Transmission command is not required at the end of this type of multiple block read. (sending the Stop Transmission command after the card has transmitted the last block is regarded as an illegal command.) Transaction can be aborted by sending the Stop Transmission command. If the card detects an error, the host must abort the operation by sending the Stop Transmission command.

All data write and read commands can be aborted any time by a Stop Transmission command CMD12. The following data abort procedure applies during an ongoing data transfer:

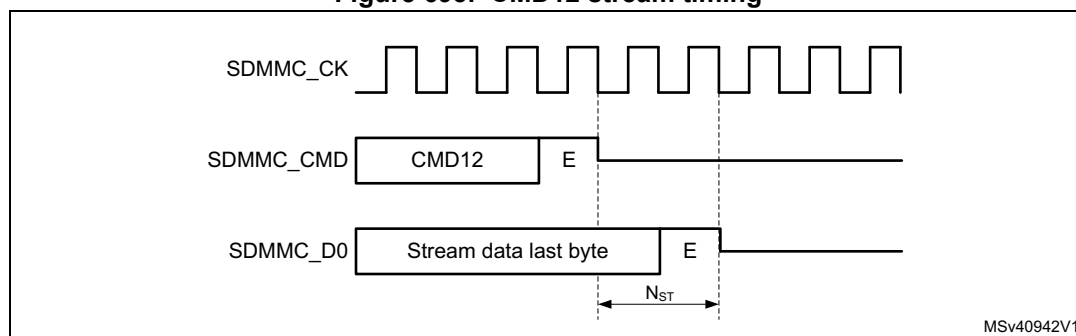

1. Load CMD12 Stop Transmission command in registers and set the CMDSTOP bit.
  - a) This causes the CPSM Abort signal to be generated when the command is sent to the DPSM.
2. Configure the CPSM to send a command immediately (clear WAITPEND bit).
  - a) The card, when sending data, stops data transfer 2 cycles after the Stop Transmission command end bit.  
The card when no data is being sent, does not start sending any new data.
  - b) The host, when sending data, sends one last data bit followed by an end bit after the Stop Transmission command end bit.  
The host when not sending data, does not start sending any new data.
3. When IDMAEN = 0, the FIFO need to be reset with FIFORST.
  - a) When writing data to the card. On the CMDREND flag, firmware must stop writing data to the FIFO. Subsequently the FIFO must be reset with FIFORST, this flushes the FIFO.
  - b) When reading data from the card. On the CMDREND flag, firmware must read the remaining data from the FIFO. Subsequently the FIFO must be reset with FIFORST.
4. When IDMAEN = 1, hardware takes care of the FIFO.
  - a) When writing data to the card. On the CPSM Abort signal, hardware stops the IDMA and subsequently the FIFO is flushed.
  - b) When reading data from the card. On the CPSM Abort signal, hardware instructs the IDMA to transfer the remaining data from the FIFO to RAM.
5. When the FIFO is empty/reset the DABORT flag is generated.

### Stream operation and CMD12

To stop the stream transfer after the last byte to be transferred, the CMD12 end bit timing must be sent aligned with the data stream end of last byte. The following write stream data procedure applies:

1. Initialize the stream data in the DPSM, DTMODE = MCC stream data transfer.
2. Send the WRITE\_DATA\_STREAM command from the CPSM with CMDTRANS = 1.
3. Preload CMD12 in command registers, with the CMDSTOP bit set.
4. Configure the CPSM to send a command only after a wait pending (WAITPEND = 1) end of last data (according DATALENGTH).
5. Enabling the CPSM to send the STOP\_TRANSMISSION command, the stream data end bit and command end bit are aligned.
  - a) When DATALENGTH > 5 bytes, Command CMD12 is waited in the CPSM to be aligned with the data transfer end bit.
  - b) When DATALENGTH < 5 bytes, Command CMD12 is started before and the DPSM remains in the Wait\_S state to align the data transfer end with the CMD12 end bit.
6. The write stream data can be aborted any time by clearing the WAITPEND bit. This causes the Preloaded CMD12 to be sent immediately and stop the write data stream.

Figure 693. CMD12 stream timing

To stop the read stream transfer after the last byte, the CMD12 end bit timing must occur after the last data stream byte. The following read stream data procedure applies:

1. Wait for all data to be received by the DPSM and read from the FIFO (DATAEND flag).
  - a) The DPSM does not receive more data than indicated by DATALENGTH, even if the card is sending more data.
2. Send CMD12 by the CPSM.
  - a) CMD12 stops the card sending data.

*Note:* The SDMMC does not receive any more data from the card when DATACOUNT = 0, even when the card continues sending data.

### Block operation and CMD12

To stop block transfer at the end of the data, the CMD12 end bit must be sent after the last block end bit.

When writing data to the card the CMD12 end bit must be sent after the write data block CRC token end bit. This requires the CMD12 sending to be tied to the data block transmission timing. To stop an Open-ended Multiple block write, the following procedure applies:

1. Before starting the data transfer, set DTMODE to “block data transfer ending with STOP\_TRANSMISSION command”.
2. Wait for all data to be sent by the DPSM and the CRC token to be received, (DATAEND flag).
  - a) The DPSM does not send more data than indicated by DATALENGTH.
3. Send CMD12 by the CPSM.
  - a) CMD12 sets the card to Idle mode.

When reading data from the card the CMD12 end bit must be sent earliest at the same time as the card read data block last data bit. This requires the CMD12 sending to be tied to the data block reception timing. The following stop Open-ended Multiple block read data block procedure applies:

1. Before starting the data transfer, set DTMODE to “block data transfer ending with STOP\_TRANSMISSION command”.
2. Wait for all data to be received by the DPSM and read from the FIFO (DATAEND flag).
  - a) The DPSM does not receive more data than indicated by DATALENGTH, even if the card is sending more data.
3. Send CMD12 with CMDSTOP bit set by the CPSM.
  - a) CMD12 stops the Card sending more data and set the card to Idle mode. Any ongoing block transfer is aborted by the Card.

*Note:* The SDMMC does not receive any more data from the card when *DATACOUNT = 0*, even when the card continues sending data.

### 60.6.3 Sleep (CMD5)

The eMMC card may be switched between a Sleep state and a Standby state by CMD5. In the Sleep state the power consumption of the card is minimized and the Vcc power supply may be switched off.

The CMD5 (SLEEP) is used to initiate the state transition from Standby state to Sleep state. The card indicates Busy, pulling down SDMMC\_D0, during the transition phase. The Sleep state is reached when the card stops pulling down the SDMMC\_DO line.

To set the card into Sleep state the following procedure applies:

1. Enable interrupt on BUSYD0END.
2. Send CMD5 (SLEEP).
3. On BUSYD0END interrupt, card is in Sleep state
4. Vcc power supply can be switched off

The CMD5 (AWAKE) is used to initiate the state transition from Sleep state to Standby state. The card indicates Busy, pulling down SDMMC\_D0, during the transition phase. The Standby state is reached when the card stops pulling down the SDMMC\_DO line.

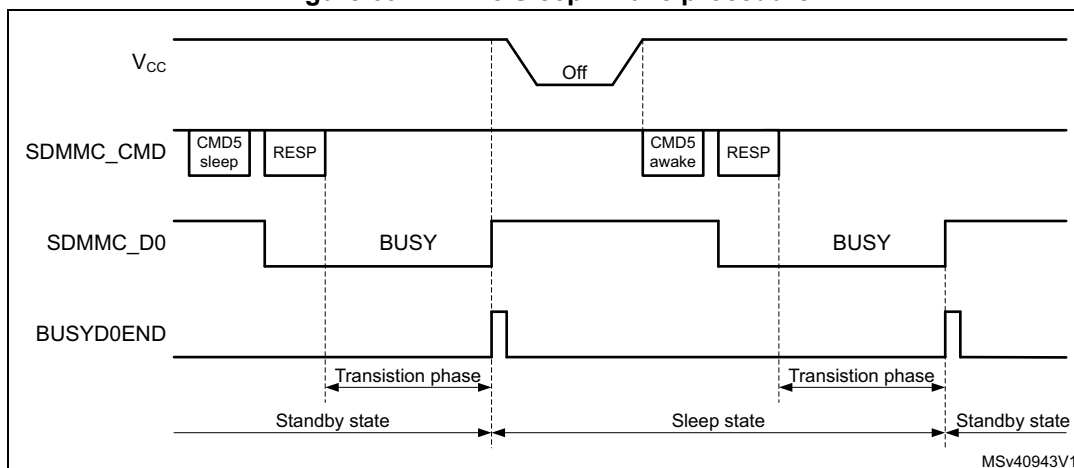

To set the card into Sleep state the following procedure applies:

1. Switch on Vcc power supply and wait unit minimum operating level is reached.
2. Enable interrupt on BUSYD0END.
3. Send CMD5 (AWAKE).
4. On BUSYD0END interrupt card is in Standby state.

The Vcc power supply can be switched off only after the Sleep state has been reached. The Vcc supply must be reinstalled before CMD5 (AWAKE) is sent.

Figure 694. CMD5 Sleep Awake procedure

### 60.6.4 Interrupt mode (Wait-IRQ)

The host and card enter and exit interrupt mode (Wait-IRQ) simultaneously. In interrupt mode there is no data transfer. The only message allowed is an interrupt service request response from the card or the host. For the interrupt mode to work correctly the SDMMC\_CLK frequency must be set in accordance with the achievable SDMMC\_CMD data rate in Open Drain mode, which depend on the capacitive load and pull-up resistor. The CLKDIV must be set >1, and the SETCLKRX must select either the sdmmc\_io\_in\_ck or SDMMC\_CLKin source.

The host must ensure that the card is in Standby state before issuing the CMD40 (GO\_IRQ\_STATE). While waiting for an interrupt response the SDMMC\_CLK clock signal must be kept active.

A card in interrupt mode (IRQ state):

- is waiting for an internal card interrupt event. Once the event occurs, the card starts to send the interrupt service request response. The response is sent in open-drain mode.
- while waiting for the internal card interrupt event, the card also monitors the SDMMC\_CMD line for a start bit. Upon detection of a start bit the card aborts the interrupt mode and switch to Standby state.

The host in interrupt mode (CPSM Wait state waiting for interrupt):

- is waiting for a card interrupt service request response (start bit).
- while waiting for a card interrupt service request response the host may abort the interrupt mode (by clearing the WAITINT register bit), which causes the host to send a interrupt service request response R5 with RCA = 0x0000 in open-drain mode.

When sending the interrupt service request response, the sender bit-wise monitors the SDMMC\_CMD bit stream. The sender whose interrupt service request response bit does not correspond to the bit on the SDMMC\_CMD line stops sending. In the case of multiple senders only one successfully sends its full interrupt service request response. If the host sends simultaneously, it loses sending after the transmission bit.

To handle the interrupt mode, the following procedure applies:

1. Set the SDMMC\_CK frequency in accordance with the achievable SDMMC\_CMD data rate in Open-drain mode, CLKDIV must be set >1, and SETCLKRX must select the sdmmc\_io\_in\_ck.
2. Load CMD40 (GO\_IRQ\_STATE) in the command registers.
3. Enable wait for interrupt by setting WAITINT register bit.
4. Configure the CPSM to send a command immediately.
  - a) This causes the CMD40 to be sent and the CPSM to be halted in the Wait state, waiting for a interrupt service request response.
5. To exit the wait for interrupt state (CPSM Wait state):
  - a) Upon the detection of an interrupt service request response start bit the CPSM moves to the Receive state where the response is received. The complete reception of the response is indicated by the CMDREND or the command CRC error flags.
  - b) To abort the interrupt mode the host clears the WAITINT register bit, which causes the host to send an interrupt service request response by itself. This moves the CPSM to the Receive state. The complete reception of the response is indicated by the CMDREND or the command CRC error flags.

*Note:* On a simultaneous send interrupt service request response start bit collision the host loses the bus access after the transmission bit.

### 60.6.5 Boot operation

In boot operation mode the host can read boot data from the card by either one of the 2 boot operation functions:

1. Normal boot. (keeping CMD line low)
2. Alternative boot (sending CMD0 with argument 0xFFFFFFFF)

The boot data can be read according the following configuration options, depending on card register settings:

- The partition from which boot data is read (EXT\_CSD Byte[179])
- The boot data size (EXT\_CSD Byte[226])
- The bus configuration during boot (EXT\_CSD Byte[177])
- Receiving boot acknowledgment from the card. (EXT\_CSD Byte[179])

If boot acknowledgment is enabled the card send pattern 010 on SDMMC\_D0 within 50ms after boot mode has been requested by either CMD line going low or after CMD0 with argument 0xFFFFFFFF. A boot acknowledgment timeout (ACKTIMEOUT) and acknowledgment status (ACKFAIL) is provided.

#### Normal boot operation

If the SDMMC\_CMD line is held low for at least 74 clock cycles after card power-up or reset, before the first command is issued, the card recognizes that boot mode is being initiated. Within 1 second after the CMD line goes low, the card starts to sent the first boot code data on the SDMMC\_Dn line(s). The host must keep the SDMMC\_CMD line low until after all boot data has been read. The host can terminate boot mode by pulling the SDMMC\_CMD line high.

Figure 695. Normal boot mode operation

To perform the normal boot procedure the following steps needed:

1. Reset the card.
2. if a boot acknowledgment is requested enable the BOOTACKEN and set the ACKTIME and enable the ACKFAIL and ACKTIMEOUT interrupt.
3. enable the data reception by setting the DPSM in receive mode (DTPDIR) and the number of data bytes to be received in DATALENGTH.
4. Enable the DTIMEOUT, DATAEND, and CMDSENT interrupts for end of boot command confirmation.
5. Select the normal boot operation mode in BOOTMODE, and enable boot in BOOTEN. The boot procedure is started by enabling the CPSM with CPSMEN. This causes:
  - the SDMMC\_CMD to be driven low. (BOOTMODE = normal boot).
  - the ACK timeout to start.
  - DPSM to be enabled.
6. The incorrect reception of the boot acknowledgment can be detected with ACKFAIL flag or ACKTIMEOUT flag when enabled.
  - when an incorrect boot acknowledgment is received the ACKFAIL flag occurs.
  - when the boot acknowledgment is not received in time the ACKTIMEOUT flag occurs.
7. when all boot data has been received the DATAEND flag occurs.
  - when data CRC fails the DCRCFAIL flag is also generated.
  - when the data timeout occurs the DTIMEOUT flag is also generated.
8. When last data has been received, read data from the FIFO until FIFO is empty after which end of data DATAEND flag is generated.
  - SDMMC has completely received all data and the DPSM is disabled.
9. The boot procedure is terminated by firmware clearing BOOTEN, which causes the SDMMC\_CMD line to go high. The CMDSENT flag is generated 56 cycles later to indicate that a new command can be sent.
  - a) If the boot procedure is aborted by firmware before all data has been received the CPSM Abort signal stops data reception and disables the DPSM which triggers an DABORT flag when enabled.
10. The CMDSENT flag signals the end of the boot procedure and the card is ready to receive a new command.

**Alternative boot operation**

After card power-up or reset, if the host send CMD0 with the argument 0xFFFFFFFF after 74 clock cycles before CMD0 is issued, the card recognizes that boot mode is being initiated. Within 1 second after the CMD0 with argument 0xFFFFFFFF has been sent, the card starts to send the first boot code data on the SDMMC\_Dn line(s). The master terminates boot operation by sending CMD0 (Reset).

**Figure 696. Alternative boot mode operation**

To perform the alternative boot procedure the following steps needed:

1. Move the SDMMC to power-off state, and reset the card
2. Move the SDMMC to power-on state. This guarantees the 74 SCDMMC\_CK cycles to be clocked before any command.
3. if a boot acknowledgment is requested enable the BOOTACKEN and set the ACKTIME and enable the ACKTIMEOUT flag.
4. enable the data reception by setting the DPSM in receive mode (DTPDIR) and the number of data to be received in DATALENGTH. Enable the DTIMEOUT and DATAEND flags.
5. Select the alternative boot operation mode in BOOTMODE, load the CMD0 with the 0xFFFFFFFF argument in the command registers. Enable CMDSENT flag for end of

- boot command confirmation, and enable boot in BOOTEN. The boot procedure is started by enabling the CPSM with CPSMEN. This causes:
- the loaded command and argument to be sent out. (BOOTMODE = alternative boot).
  - the ACK timeout to start.
  - DPSM to be enabled.
6. When the command has been sent the CMDSENT flag is generated, at which time the BOOTEN bit must be cleared.
  7. the reception of the boot acknowledgment can be detected with ACKFAIL flag when enabled.
    - when the boot acknowledgment is not received in time the ACKTIMEOUT flag occurs.
  8. when all boot data has been received the DATAEND flag occurs.
    - when data CRC fails the DCRCFAIL flag is also generated.
    - when the data timeout occurs the DTIMEOUT flag is also generated.
  9. When last data has been received, read data from the FIFO until FIFO is empty after which end of data DATAEND flag is generated.
    - SDMMC has completely received all data and the DPSM is disabled.
  10. The BOOTEN bit must be cleared, before terminating the boot procedure by sending CMD0 (Reset) with BOOTMODE = alternative boot. This causes the CMDSENT flag to occur 56 cycles after the Command.
    - if the boot procedure is aborted by firmware before all data has been received the CPSM Abort signal stops the data transfer and disable the DPSM which triggers an DABORT flag when enabled.
  11. The CMDSENT flag signals the end of the boot procedure and the card is ready to receive a new command. When the RESET command has been sent successfully, the BOOTMODE control bit has to be cleared to terminate the boot operation.

### 60.6.6 Response R1b handling

When sending commands which have a R1b response the busy signaling is reflected in the BUSYD0 register bit and the release of busy with the BUSYD0END flag. The SDMMC\_D0 line is sampled at the end of the R1b response and signaled in the BUSYD0 register bit. The BUSYD0 register bit is reset to not busy when the SDMMC\_D0 line release busy, at the same time the BUSYD0END flag is generated.

Figure 697. Command response R1b busy signaling

The expected maximum busy time must be set in the DATATIME register before sending the command. When enabled, the DTIMEOUT flag is set when after the R1b response busy stays active longer then the programmed time.

To detect the SDMMC\_D0 busy signaling when sending a Command with R1b response the following procedure applies:

- Enable CMDREND flag
- Send Command through CPSM.
- On the CMDREND flag check the BUSYD0 register bit.
  - If BUSYD0 signals not busy, signal busy release to the Firmware
  - If BUSYD0 signals busy, wait for BUSYD0END flag
- On BUSYD0END flag signal busy released to the firmware.
- On DTIMEOUT flag busy is active longer then programmed time.

## 60.6.7 Reset and card cycle power

### Reset

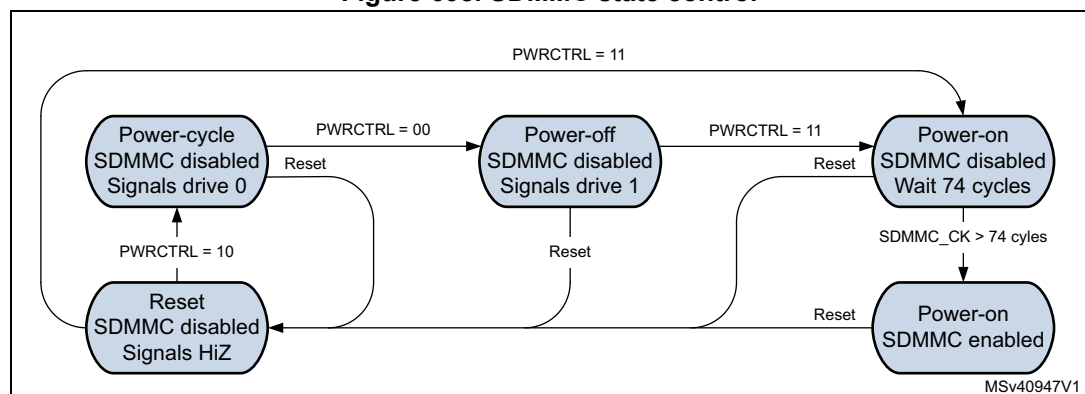

Following reset the SDMMC is in the reset state. In this state the SDMMC is disabled and no command nor data can be transferred. The SDMMC\_D[7:0], and SDMMC\_CMD are in HiZ and the SDMMC\_CK is driven low.

Before moving to the power-on state the SDMMC must be configured.

In the power-on state the SDMMC\_CK clock is running. First 74 SDMMC\_CK cycles are clocked after which the SDMMC is enabled and command and data can be transferred.

The SDMMC states are controlled by Firmware with the PWRCTRL register bits according [Figure 698](#).

**Figure 698. SDMMC state control**

### Card cycle power

To perform a card cycle power the following procedure applies:

1. Reset the SDMMC with the RCC.SDMMCxRST register bit. This resets the SDMMC to the reset state and the CPSM and DPSM to the Idle state.
2. Disable the Vcc power to the card.
3. Set the SDMMC in power-cycle state. This makes that the SDMMC\_D[7:0], SDMMC\_CMD and SDMMC\_CK are driven low, to prevent the card from being supplied through the signal lines.
4. After minimum 1 ms enable the Vcc power to the card.
5. After the power ramp period set the SDMMC to the power-off state for minimum 1 ms. The SDMMC\_D[7:0], SDMMC\_CMD and SDMMC\_CK are set to drive "1".
6. After the 1 ms delay set the SDMMC to power-on state in which the SDMMC\_CK clock is enabled.
7. After 74 SDMMC\_CK cycles the first command can be sent to the card.

Figure 699. Card cycle power / power up diagram

## 60.7 Hardware flow control

The hardware flow control during data transfer functionality is used to avoid FIFO underrun (TX mode) and overrun (RX mode) errors.

The behavior is to stop SDMMC\_CK during data transfer and freeze the SDMMC state machines. The data transfer is stalled when the FIFO is unable to transmit or receive data. The data transfer remains stalled until the transmit FIFO is half full or all data according DATALENGTH has been stored, or until the receive FIFO is half empty. Only state machines clocked by SDMMC\_CK are frozen, the AHB interfaces are still alive. The FIFO can thus be filled or emptied even if flow control is activated.

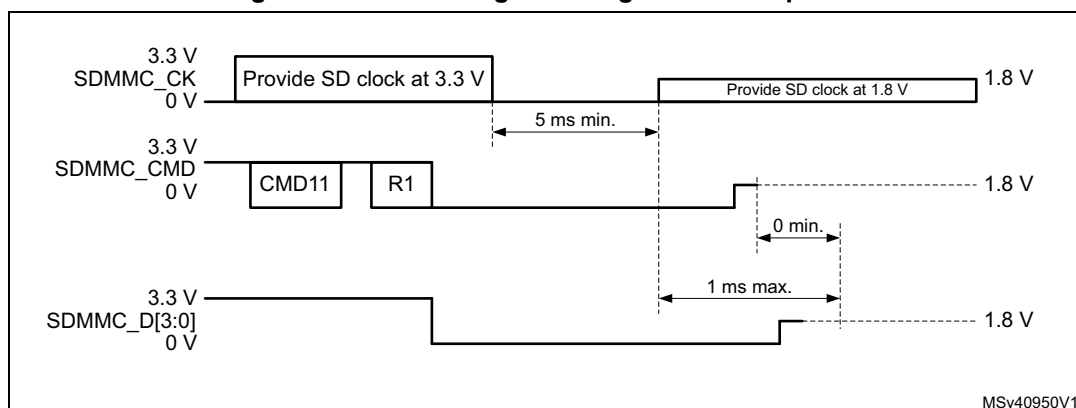

To enable hardware flow control during data transfer, the HWFC\_EN register bit must be set to 1. After reset hardware flow control is disabled.

Hardware flow control must only be used when the SDMMC\_Dn data is cycle-aligned with the SDMMC\_CK. Whenever the `sdmmc_fb_ck` from the DLYB delay block is used, i.e in the case of SDR104 mode with a  $t_{OP}$  and  $Dt_{OP}$  delay  $> 1$  cycle, hardware flow control can not be used.

## 60.8 Ultra-high-speed phase I (UHS-I) voltage switch

UHS-I mode (SDR12, SDR25, SDR50, SDR104, and DDR50) requires the support for 1.8V signaling. After power up the card starts in 3.3V mode. CMD11 invokes the voltage switch sequence to the 1.8V mode. When the voltage sequence is completed successfully the card enters UHS-I mode with default SDR12 and card input and output timings are changed.

Figure 700. CMD11 signal voltage switch sequence

To perform the signal voltage switch sequence the following steps are needed:

1. Before starting the Voltage Switch procedure, the SDMMC\_CK frequency must be set in the range 100 kHz - 400 kHz.
2. The host starts the Voltage Switch procedure by setting the VSWITCHEN bit before sending the CMD11.
3. The card returns an R1 response.
  - if the response CRC is pass, the Voltage Switch procedure continues the host does no longer drive the CMD and SDMMC\_D[3:0] signals until completion of the voltage switch sequence. Some cycles after the response the SDMMC\_CK is stopped and the CKSTOP flag is set.
  - if the response CRC is fail (CCRCFAIL flag) or no response is received before the timeout (CTIMEOUT flag), the Voltage Switch procedure is stopped.
4. The card drives CMD and SDMMC\_D[3:0] to low at the next clock after the R1 response.
5. The host, after having received the R1 response, may monitor the SDMMC\_D0 line using the BUSYD0 register bit. The SDMMC\_D0 line is sampled two SDMMC\_CK clock cycles after the Response. The Firmware may read the BUSYD0 register bit following the CKSTOP flag.
  - When the BUSYD0 is detected low the host firmware switches the Voltage regulator to 1.8V, after which it instructs the SDMMC to start the timing critical

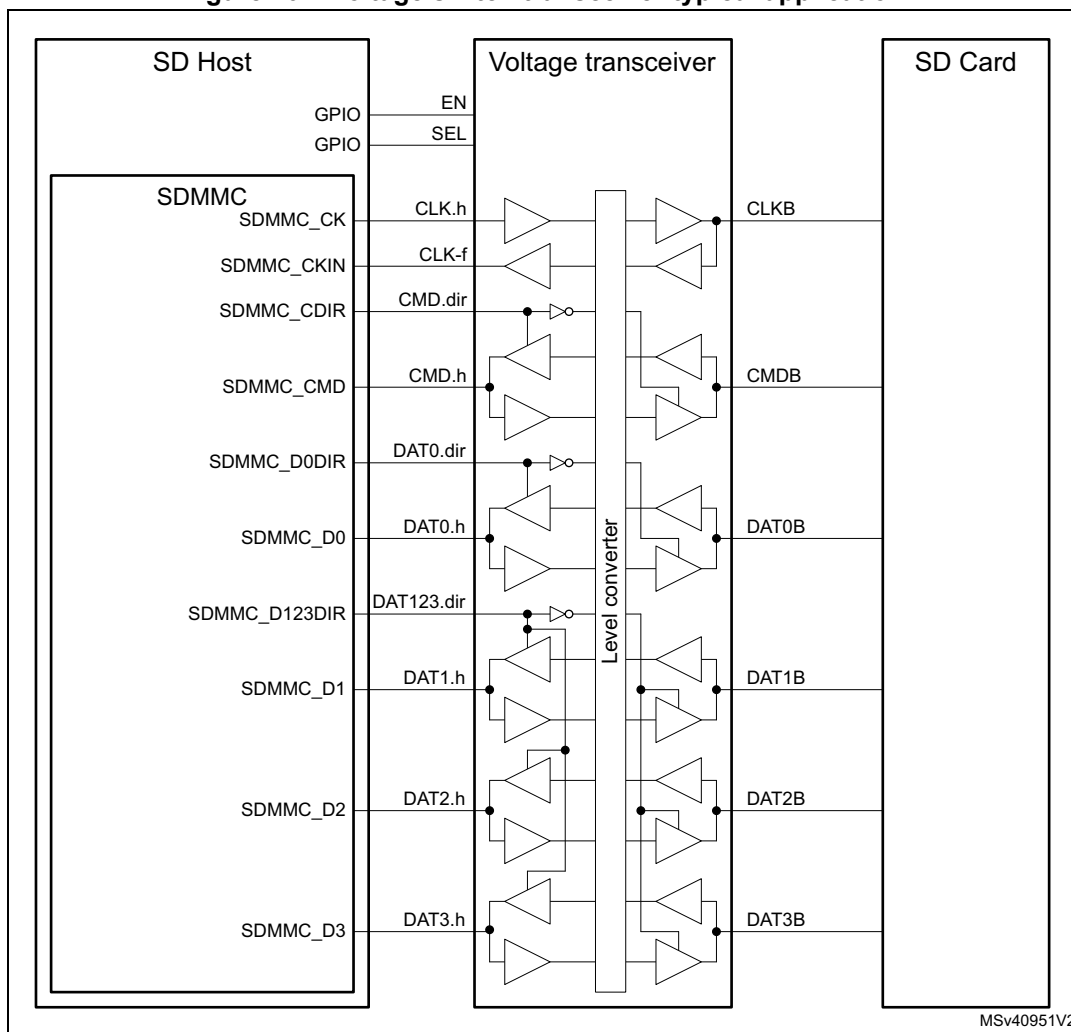

- section of the Voltage Switch sequence by setting register bit VSWITCH. The hardware continues to stop the SDMMC\_CK by holding it low for at least 5 ms.
- When the BUSYD0 is detected high the host aborts the Voltage Switch sequence and cycle power the card.
6. The card after detecting SDMMC\_CK low begins switching signaling voltage to 1.8 V.
  7. The host SDMMC hardware after at least 5 ms restarts the SDMMC\_CK.
  8. The card within 1 ms from detecting SDMMC\_CK transition drives CMD and DAT[3:0] high for at least 1 SDMMC\_CK cycle and then stop driving CMD and DAT[3:0].
  9. The host SDMMC hardware, 1 ms after the SDMMC\_CK has been restarted, the SDMMC\_D0 is sampled into BUSYD0 and the VSWEND flag is set.
  10. The host, on the VSWEND flag, checks SDMMC\_D0 line using the BUSYD0 register bit, to confirm completion of voltage switch sequence:
    - When BUSYD0 is detected high, Voltage Switch has been completed successfully.
    - When BUSYD0 is detected low, Voltage Switch has failed, the host cycles the card power.

The minimum 5 ms time to stop the SDMMC\_CK is derived from the internal un-gated SDMMC\_CK clock, which has a maximum frequency of 25 MHz (SD mode), as set by the clock divider CLKDIV. The >5 ms time is counted by  $2^{12}$  cycles (10.24 ms @ 400 kHz). If a lower SDMMC\_CK frequency is selected by the clock divider CLKDIV the time for the SDMMC\_CK clock to be stopped is longer.

The maximum 1 ms time for the card to drive the SDMMC\_Dn and SDMMC\_CMD lines high is derived from the internal un-gated SDMMC\_CK which has a maximum frequency of 25 MHz (SD mode), as set by the clock divider CLKDIV. The SDMMC checks the lines after >1 ms time which is counted by  $2^9$  cycles (1.28 ms @ 25 MHz). If a lower SDMMC\_CK frequency is selected by the clock divider CLKDIV the time to check the lines is longer.

The signal voltage level is supported through an external voltage translation transceiver like STMicroelectronics ST6G3244ME.

Figure 701. Voltage switch transceiver typical application

MSv40951V2

To interface with an external driver (a voltage switch transceiver), next to the standard signals the SDMMC uses the following signals:

**SDMMC\_CKIN** feedback input clock

**SDMMC\_CDIRE** I/O direction control for the CMD signal.

**SDMMC\_D0DIR** I/O direction control for the SDMMC\_D0 signal.

**SDMMC\_D123DIR** I/O direction control for the SDMMC\_D1, SDMMC\_D2 and SDMMC\_D3 signals.

The voltage transceiver signals **EN** and **SEL** are to be handled through general-purpose I/O.

The polarity of the SDMMC\_CDIRE, SDMMC\_D0DIR and SDMMC\_D123DIR signals can be selected through SDMMC\_POWER.DIRPOL control bit.

## 60.9 SDMMC interrupts

Table 464. SDMMC interrupts

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit from Sleep mode
SDMMC	Command response CRC fail	CCRCFAIL	CCRCFAILIE	CCRCFAILC	Yes
SDMMC	Data block CRC fail	DCRCFAIL	DCRCFAILIE	DCRCFAILC	Yes
SDMMC	Command response timeout	CTIMEOUT	CTIMEOUTIE	CTIMEOUTC	Yes
SDMMC	Data timeout	DTIMEOUT	DTIMEOUTIE	DTIMEOUTC	Yes
SDMMC	Transmit FIFO underrun	TXUNDERR	TXUNDERRIE	TXUNDERRC	Yes
SDMMC	Receive FIFO overrun	RXOVERR	RXOVERRIE	RXOVERRC	Yes
SDMMC	Command response received	CMDREND	CMDRENDIE	CMDRENDC	Yes
SDMMC	Command sent	CMDSENT	CMDSENTIE	CMDSENTC	Yes
SDMMC	Data transfer ended	DATAEND	DATAENDIE	DATAENDC	Yes
SDMMC	Data transfer hold	DHOLD	DHOLDIE	DHOLDC	Yes
SDMMC	Data block sent or received	DBCKEND	DBCKENDIE	DBCKENDC	Yes
SDMMC	Data transfer aborted	DABORT	DABORTIE	DABORTC	Yes
SDMMC	Transmit FIFO half empty	TXFIFOHE	TXFIFOHEIE	n.a.	Yes
SDMMC	Receive FIFO half full	RXFIFOHF	RXFIFOHFIE	n.a.	Yes
SDMMC	Transmit FIFO full	TXFIFO	n.a.	n.a.	Yes
SDMMC	Receive FIFO full	RXFIFO	RXFIFOIE	n.a.	Yes
SDMMC	Transmit FIFO empty	TXFIFOE	TXFIFOEIE	n.a.	Yes
SDMMC	Receive FIFO empty	RXFIFOE	n.a.	n.a.	Yes

Table 464. SDMMC interrupts (continued)

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit from Sleep mode
SDMMC	Command response end of busy	BUSYD0END	BUSYD0ENDIE	BUSYD0ENDC	Yes
SDMMC	SDIO interrupt	SDIOIT	SDIOITIE	SDIOITC	Yes
SDMMC	Boot acknowledgment fail	ACKFAIL	ACKFAILIE	ACKFAILC	Yes
SDMMC	Boot acknowledgment timeout	ACKTIMEOUT	ACKTIMEOUTIE	ACKTIMEOUTC	Yes
SDMMC	Voltage switch timing	VSWEND	VSWENDIE	VSWENDC	Yes
SDMMC	SDMMCK stopped in voltage switch	CKSTOP	CKSTOPIE	CKSTOPC	Yes
SDMMC	IDMA transfer error	IDMATE	IDMATEIE	IDMATEC	Yes
SDMMC	IDMA buffer transfer complete	IDMABTC	IDMABTCIE	IDMABTCC	Yes

## 60.10 SDMMC registers

The device communicates to the system via 32-bit control registers accessible via AHB slave interface.

The peripheral registers have to be accessed by words (32-bit). Byte (8-bit) and halfword (16-bit) accesses trigger an AHB bus error.

### 60.10.1 SDMMC power control register (SDMMC\_POWER)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DIR POL	VSWI TCHEN	VSWI TCH	PWRCTRL[1:0]	
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **DIRPOL**: Data and command direction signals polarity selection

This bit can only be written when the SDMMC is in the power-off state (PWRCTRL = 00).

0: Voltage transceiver IOs driven as output when direction signal is low.

1: Voltage transceiver IOs driven as output when direction signal is high.

Bit 3 **VSWITCHEN**: Voltage switch procedure enable

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).

This bit is used to stop the SDMMC\_CK after the voltage switch command response:

0: SDMMC\_CK clock kept unchanged after successfully received command response.

1: SDMMC\_CK clock stopped after successfully received command response.

Bit 2 **VSWITCH**: Voltage switch sequence start

This bit is used to start the timing critical section of the voltage switch sequence:

0: Voltage switch sequence not started and not active.

1: Voltage switch sequence started or active.

Bits 1:0 **PWRCTRL[1:0]**: SDMMC state control bits

These bits can only be written when the SDMMC is not in the power-on state (PWRCTRL ≠ 11).

These bits are used to define the functional state of the SDMMC signals:

00: After reset, Reset: the SDMMC is disabled and the clock to the Card is stopped, SDMMC\_D[7:0], and SDMMC\_CMD are HiZ and SDMMC\_CK is driven low.

When written 00, power-off: the SDMMC is disabled and the clock to the card is stopped, SDMMC\_D[7:0], SDMMC\_CMD and SDMMC\_CK are driven high.

01: Reserved. (When written 01, PWRCTRL value does not change)

10: Power-cycle, the SDMMC is disabled and the clock to the card is stopped, SDMMC\_D[7:0], SDMMC\_CMD and SDMMC\_CK are driven low.

11: Power-on: the card is clocked, The first 74 SDMMC\_CK cycles the SDMMC is still disabled. After the 74 cycles the SDMMC is enabled and the SDMMC\_D[7:0], SDMMC\_CMD and SDMMC\_CK are controlled according the SDMMC operation.

Any further write is ignored, PWRCTRL value keeps 11.

### 60.10.2 SDMMC clock control register (SDMMC\_CLKCR)

Address offset: 0x004

Reset value: 0x0000 0000

The SDMMC\_CLKCR register controls the SDMMC\_CK output clock, the sdmmc\_rx\_ck receive clock, and the bus width.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SELCLKRX[1:0]		BUS SPEED	DDR	HWFC _EN	NEG EDGE
										r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WID BUS[1:0]		Res.	PWR SAV	Res.	Res.	CLKDIV[9:0]									
r/w	r/w		r/w			r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:20 **SELCLKRX[1:0]**: Receive clock selection

These bits can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

00: sdmmc\_io\_in\_ck selected as receive clock

01: SDMMC\_CKIN feedback clock selected as receive clock

10: sdmmc\_fb\_ck tuned feedback clock selected as receive clock.

11: Reserved (select sdmmc\_io\_in\_ck)

Bit 19 **BUSPEED**: Bus speed for selection of SDMMC operating modes

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

0: DS, HS, SDR12, SDR25, Legacy compatible, High speed SDR, High speed DDR bus speed mode selected

1: SDR50, DDR50, SDR104, HS200 bus speed mode selected.

Bit 18 **DDR**: Data rate signaling selection

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

DDR rate must only be selected with 4-bit or 8-bit wide bus mode. (WIDBUS > 00). DDR = 1 has no effect when WIDBUS = 00 (1-bit wide bus).

DDR rate must only be selected with clock division >1. (CLKDIV > 0)

0: SDR Single data rate signaling

1: DDR double data rate signaling

Bit 17 **HWFC\_EN**: Hardware flow control enable

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

0: Hardware flow control is disabled

1: Hardware flow control is enabled

When Hardware flow control is enabled, the meaning of the TXFIFOE and RXFIFOE flags change, see SDMMC status register definition in [Section 60.10.11](#).

Bit 16 **NEGEDGE**: SDMMC\_CK dephasing selection bit for data and command

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0).

When clock division = 1 (CLKDIV = 0), this bit has no effect. Data and Command change on SDMMC\_CK falling edge.

0: When clock division >1 (CLKDIV > 0) & DDR = 0:

- Command and data changed on the sdmmc\_ker\_ck falling edge succeeding the rising edge of SDMMC\_CK.
- SDMMC\_CK edge occurs on sdmmc\_ker\_ck rising edge.

When clock division >1 (CLKDIV > 0) & DDR = 1:

- Command changed on the sdmmc\_ker\_ck falling edge succeeding the rising edge of SDMMC\_CK.
- Data changed on the sdmmc\_ker\_ck falling edge succeeding a SDMMC\_CK edge.
- SDMMC\_CK edge occurs on sdmmc\_ker\_ck rising edge.

1: When clock division >1 (CLKDIV > 0) & DDR = 0:

- Command and data changed on the same sdmmc\_ker\_ck rising edge generating the SDMMC\_CK falling edge.

When clock division >1 (CLKDIV > 0) & DDR = 1:

- Command changed on the same sdmmc\_ker\_ck rising edge generating the SDMMC\_CK falling edge.
- Data changed on the SDMMC\_CK falling edge succeeding a SDMMC\_CK edge.
- SDMMC\_CK edge occurs on sdmmc\_ker\_ck rising edge.

Bits 15:14 **WIDBUS[1:0]**: Wide bus mode enable bit

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

00: Default 1-bit wide bus mode: SDMMC\_D0 used (Does not support DDR)

01: 4-bit wide bus mode: SDMMC\_D[3:0] used

10: 8-bit wide bus mode: SDMMC\_D[7:0] used

Bit 13 Reserved, must be kept at reset value.

Bit 12 **PWRSABV**: Power saving configuration bit

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

For power saving, the SDMMC\_CK clock output can be disabled when the bus is idle by setting PWRSABV:

0: SDMMC\_CK clock is always enabled

1: SDMMC\_CK is only enabled when the bus is active

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:0 **CLKDIV[9:0]**: Clock divide factor

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0).

This field defines the divide factor between the input clock (sdmmc\_ker\_ck) and the output clock (SDMMC\_CK):  $SDMMC\_CK\ frequency = sdmmc\_ker\_ck / [2 * CLKDIV]$ .

0x000: SDMMC\_CK frequency = sdmmc\_ker\_ck / 1 (Does not support DDR)

0x001: SDMMC\_CK frequency = sdmmc\_ker\_ck / 2

0x002: SDMMC\_CK frequency = sdmmc\_ker\_ck / 4

0x0XX: etc..

0x080: SDMMC\_CK frequency = sdmmc\_ker\_ck / 256

0xXXX: etc..

0x3FF: SDMMC\_CK frequency = sdmmc\_ker\_ck / 2046

- Note:
- 1 While the SD/SDIO card or e•MMC is in identification mode, the SDMMC\_CK frequency must be less than 400 kHz.
  - 2 The clock frequency can be changed to the maximum card bus frequency when relative card addresses are assigned to all cards.
  - 3 At least seven sdmmc\_hclk clock periods are needed between two write accesses to this register. SDMMC\_CK can also be stopped during the Read Wait interval for SD I/O cards: in this case the SDMMC\_CLKCR register does not control SDMMC\_CK.

### 60.10.3 SDMMC argument register (SDMMC\_ARGR)

Address offset: 0x008

Reset value: 0x0000 0000

The SDMMC\_ARGR register contains a 32-bit command argument, which is sent to a card as part of a command message.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CMDARG[31:16]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CMDARG[15:0]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:0 **CMDARG[31:0]**: Command argument

These bits can only be written by firmware when CPSM is disabled (CPSMEN = 0).

Command argument sent to a card as part of a command message. If a command contains an argument, it must be loaded into this register before writing a command to the command register.

### 60.10.4 SDMMC command register (SDMMC\_CMDR)

Address offset: 0x00C

Reset value: 0x0000 0000

The SDMMC\_CMDR register contains the command index and command type bits. The command index is sent to a card as part of a command message. The command type bits control the command path state machine (CPSM).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CMD SUS PEND
															r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BOOT EN	BOOT MODE	DT HOLD	CPSM EN	WAITP END	WAIT INT	WAITRESP[1:0]		CMD STOP	CMD TRANS	CMDINDEX[5:0]					
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:17 Reserved, must be kept at reset value.

- Bit 16 **CMDSPEND**: The CPSM treats the command as a Suspend or Resume command and signals interrupt period start/end  
 This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).  
 CMDSPEND = 1 and CMDTRANS = 0 Suspend command, start interrupt period when response bit BS=0.  
 CMDSPEND = 1 and CMDTRANS = 1 Resume command with data, end interrupt period when response bit DF=1.
- Bit 15 **BOOTEN**: Enable boot mode procedure  
 0: Boot mode procedure disabled  
 1: Boot mode procedure enabled
- Bit 14 **BOOTMODE**: Select the boot mode procedure to be used  
 This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0)  
 0: Normal boot mode procedure selected  
 1: Alternative boot mode procedure selected.
- Bit 13 **DTHOLD**: Hold new data block transmission and reception in the DPSM  
 If this bit is set, the DPSM does not move from the Wait\_S state to the Send state or from the Wait\_R state to the Receive state.
- Bit 12 **CPSMEN**: Command path state machine (CPSM) enable bit  
 This bit is written 1 by firmware, and cleared by hardware when the CPSM enters the Idle state.  
 If this bit is set, the CPSM is enabled.  
 When DTEN = 1, no command is transferred nor boot procedure is started. CPSMEN is cleared to 0.  
 During Read Wait with SDMMC\_CK stopped no command is sent and CPSMEN is kept 0.
- Bit 11 **WAITPEND**: CPSM waits for end of data transfer (CmdPend internal signal) from DPSM  
 This bit when set, the CPSM waits for the end of data transfer trigger before it starts sending a command.  
 WAITPEND is only taken into account when DTMODE = eMMC stream data transfer, WIDBUS = 1-bit wide bus mode, DPSSACT = 1 and DTDIR = from host to card.
- Bit 10 **WAITINT**: CPSM waits for interrupt request  
 If this bit is set, the CPSM disables command timeout and waits for an card interrupt request (Response).  
 If this bit is cleared in the CPSM Wait state, it causes the abort of the interrupt mode.
- Bits 9:8 **WAITRESP[1:0]**: Wait for response bits  
 This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).  
 They are used to configure whether the CPSM is to wait for a response, and if yes, which kind of response.  
 00: No response, expect CMDSENT flag  
 01: Short response, expect CMDREND or CCRCFAIL flag  
 10: Short response, expect CMDREND flag (No CRC)  
 11: Long response, expect CMDREND or CCRCFAIL flag

Bit 7 **CMDSTOP**: The CPSM treats the command as a Stop Transmission command and signals abort to the DPSM

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).  
If this bit is set, the CPSM issues the abort signal to the DPSM when the command is sent.

Bit 6 **CMDTRANS**: The CPSM treats the command as a data transfer command, stops the interrupt period, and signals DataEnable to the DPSM

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).  
If this bit is set, the CPSM issues an end of interrupt period and issues DataEnable signal to the DPSM when the command is sent.

Bits 5:0 **CMDINDEX[5:0]**: Command index

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).  
The command index is sent to the card as part of a command message.

- Note:*
- 1 *At least seven sdmmc\_hclk clock periods are needed between two write accesses to this register.*
  - 2 *MultiMediaCard can send two kinds of response: short responses, 48 bits, or long responses, 136 bits. SD card and SD I/O card can send only short responses, the argument can vary according to the type of response: the software distinguishes the type of response according to the send command.*

### 60.10.5 SDMMC command response register (SDMMC\_RESPCMDR)

Address offset: 0x010

Reset value: 0x0000 0000

The SDMMC\_RESPCMDR register contains the command index field of the last command response received. If the command response transmission does not contain the command index field (long or OCR response), the RESPCMD field is unknown, although it must contain 111111b (the value of the reserved field from the response).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RESPCMD[5:0]					
										r	r	r	r	r	r

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **RESPCMD[5:0]**: Response command index

Read-only bit field. Contains the command index of the last command response received.

### 60.10.6 SDMMC response x register (SDMMC\_RESPxR)

Address offset: 0x010 + 0x004 \* x, (x = 1 to 4)

Reset value: 0x0000 0000

The SDMMC\_RESP1/2/3/4R registers contain the status of a card, which is part of the received response.

Bits 31:0 **CARDSTATUS[31:0]**: Card status according table below

See [Table 465](#).

The card status size is 32 or 128 bits, depending on the response type.

**Table 465. Response type and SDMMC\_RESPxR registers**

Register <sup>(1)</sup>	Short response	Long response
SDMMC_RESP1R	Card status[31:0]	Card status [127:96]
SDMMC_RESP2R	all 0	Card status [95:64]
SDMMC_RESP3R	all 0	Card status [63:32]
SDMMC_RESP4R	all 0	Card status [31:0] <sup>(2)</sup>

1. The most significant bit of the card status is received first.
2. The SDMMC\_RESP4R register LSB is always 0.

### 60.10.7 SDMMC data timer register (SDMMC\_DTIMER)

Address offset: 0x024

Reset value: 0x0000 0000

The SDMMC\_DTIMER register contains the data timeout period, in card bus clock periods.

A counter loads the value from the SDMMC\_DTIMER register, and starts decrementing when the data path state machine (DPSM) enters the Wait\_R or Busy state. If the timer reaches 0 while the DPSM is in either of these states, the timeout status flag is set.

Bits 31:0 **DATATIME[31:0]**: Data and R1b busy timeout period

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0).

Data and R1b busy timeout period expressed in card bus clock periods.

*Note:* A data transfer must be written to the data timer register and the data length register before being written to the data control register.

### 60.10.8 SDMMC data length register (SDMMC\_DLENR)

Address offset: 0x028

Reset value: 0x0000 0000

The SDMMC\_DLENR register contains the number of data bytes to be transferred. The value is loaded into the data counter when data transfer starts.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	DATALENGTH[24:16]								
							rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATALENGTH[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:0 **DATALENGTH[24:0]**: Data length value

This register can only be written by firmware when DPSM is inactive (DPSMACT = 0).

Number of data bytes to be transferred.

When DDR = 1 DATALENGTH is truncated to a multiple of 2. (The last odd byte is not transferred)

When DATALENGTH = 0 no data are transferred, when requested by a CPSMEN and CMDTRANS = 1 also no command is transferred. DTEN and CPSMEN are cleared to 0.

*Note:* For a block data transfer, the value in the data length register must be a multiple of the block size (see SDMMC\_DCTRL). A data transfer must be written to the data timer register and the data length register before being written to the data control register.

For an SDMMC multibyte transfer the value in the data length register must be between 1 and 512.

**60.10.9 SDMMC data control register (SDMMC\_DCTRL)**

Address offset: 0x02C

Reset value: 0x0000 0000

The SDMMC\_DCTRL register control the data path state machine (DPSM).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	FIFO RST	BOOT ACK EN	SDIO EN	RW MOD	RW STOP	RW START	DBLOCKSIZE[3:0]				DTMODE[1:0]		DTDIR	DTEN
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **FIFORST**: FIFO reset, flushes any remaining data

This bit can only be written by firmware when IDMAEN= 0 and DPSM is active (DPSMACT = 1). This bit only takes effect when a transfer error or transfer hold occurs.

0: FIFO not affected.

1: Flush any remaining data and reset the FIFO pointers. This bit is automatically cleared to 0 by hardware when DPSM gets inactive (DPSMACT = 0).

Bit 12 **BOOTACKEN**: Enable the reception of the boot acknowledgment

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).

0: Boot acknowledgment disabled, not expected to be received

1: Boot acknowledgment enabled, expected to be received

Bit 11 **SDIOEN**: SD I/O interrupt enable functions

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).

If this bit is set, the DPSM enables the SD I/O card specific interrupt operation.

Bit 10 **RWMOD**: Read Wait mode

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).

0: Read Wait control using SDMMC\_D2

1: Read Wait control stopping SDMMC\_CK

Bit 9 **RWSTOP**: Read Wait stop

This bit is written by firmware and auto cleared by hardware when the DPSM moves from the R\_W state to the Wait\_R or Idle state.

0: No Read Wait stop.

1: Enable for Read Wait stop when DPSM is in the R\_W state.

Bit 8 **RWSTART**: Read Wait start

If this bit is set, Read Wait operation starts.

**Bits 7:4 DBLOCKSIZE[3:0]:** Data block size

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).

Define the data block length when the block data transfer mode is selected:

0000: Block length =  $2^0 = 1$  byte  
 0001: Block length =  $2^1 = 2$  bytes  
 0010: Block length =  $2^2 = 4$  bytes  
 0011: Block length =  $2^3 = 8$  bytes  
 0100: Block length =  $2^4 = 16$  bytes  
 0101: Block length =  $2^5 = 32$  bytes  
 0110: Block length =  $2^6 = 64$  bytes  
 0111: Block length =  $2^7 = 128$  bytes  
 1000: Block length =  $2^8 = 256$  bytes  
 1001: Block length =  $2^9 = 512$  bytes  
 1010: Block length =  $2^{10} = 1024$  bytes  
 1011: Block length =  $2^{11} = 2048$  bytes  
 1100: Block length =  $2^{12} = 4096$  bytes  
 1101: Block length =  $2^{13} = 8192$  bytes  
 1110: Block length =  $2^{14} = 16384$  bytes  
 1111: Reserved

When DATALENGTH is not a multiple of DBLOCKSIZE, the transferred data is truncated at a multiple of DBLOCKSIZE. (None of the remaining data are transferred.)

When DDR = 1, DBLOCKSIZE = 0000 must not be used. (No data are transferred)

**Bits 3:2 DTMODE[1:0]:** Data transfer mode selection

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).

00: Block data transfer ending on block count.

01: SDIO multibyte data transfer.

10: eMMC Stream data transfer. (WIDBUS must select 1-bit wide bus mode)

11: Block data transfer ending with STOP\_TRANSMISSION command (not to be used with DTEN initiated data transfers).

**Bit 1 DTDIR:** Data transfer direction selection

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).

0: From host to card.

1: From card to host.

**Bit 0 DTEN:** Data transfer enable bit

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0). This bit is cleared by Hardware when data transfer completes.

This bit must only be used to transfer data when no associated data transfer command is used, i.e. must not be used with SD or eMMC cards.

0: Do not start data transfer without CPSM data transfer command.

1: Start data transfer without CPSM data transfer command.

**60.10.10 SDMMC data counter register (SDMMC\_DCNTR)**

Address offset: 0x030

Reset value: 0x0000 0000

The SDMMC\_DCNTR register loads the value from the data length register (see SDMMC\_DLENR) when the DPSM moves from the Idle state to the Wait\_R or Wait\_S state. As data is transferred, the counter decrements the value until it reaches 0. The DPSM then

moves to the Idle state and when there has been no error, and no transmit data transfer hold, the data status end flag (DATAEND) is set.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	DATACOUNT[24:16]								
							r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATACOUNT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:0 **DATACOUNT[24:0]**: Data count value

When read, the number of remaining data bytes to be transferred is returned. Write has no effect.

*Note:* This register must be read only after the data transfer is complete, or hold. When reading after an error event the read data count value may be different from the real number of data bytes transferred.

### 60.10.11 SDMMC status register (SDMMC\_STAR)

Address offset: 0x034

Reset value: 0x0000 0000

The SDMMC\_STAR register is a read-only register. It contains two types of flag:

- Static flags (bits [28, 21, 11:0]): these bits remain asserted until they are cleared by writing to the SDMMC interrupt Clear register (see SDMMC\_ICR)
- Dynamic flags (bits [20:12]): these bits change state depending on the state of the underlying logic (for example, FIFO full and empty flags are asserted and deasserted as data while written to the FIFO)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **IDMABTC**: IDMA buffer transfer complete

The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.

Bit 27 **IDMATE**: IDMA transfer error

The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.

Bit 26 **CKSTOP**: SDMMC\_CK stopped in Voltage switch procedure

The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.

- Bit 25 **VSWEND**: Voltage switch critical timing section completion  
The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.
- Bit 24 **ACKTIMEOUT**: Boot acknowledgment timeout  
The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.
- Bit 23 **ACKFAIL**: Boot acknowledgment received (boot acknowledgment check fail)  
The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.
- Bit 22 **SDIOIT**: SDIO interrupt received  
The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.
- Bit 21 **BUSYD0END**: end of SDMMC\_D0 Busy following a CMD response detected  
This indicates only end of busy following a CMD response. This bit does not signal busy due to data transfer. Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.  
0: card SDMMC\_D0 signal does NOT signal change from busy to not busy.  
1: card SDMMC\_D0 signal changed from busy to NOT busy.
- Bit 20 **BUSYD0**: Inverted value of SDMMC\_D0 line (Busy), sampled at the end of a CMD response and a second time 2 SDMMC\_CK cycles after the CMD response  
This bit is reset to not busy when the SDMMC\_D0 line changes from busy to not busy. This bit does not signal busy due to data transfer. This is a hardware status flag only, it does not generate an interrupt.  
0: card signals not busy on SDMMC\_D0.  
1: card signals busy on SDMMC\_D0.
- Bit 19 **RXFIFOE**: Receive FIFO empty  
This is a hardware status flag only, does not generate an interrupt. This bit is cleared when one FIFO location becomes full.
- Bit 18 **TXFIFOE**: Transmit FIFO empty  
This bit is cleared when one FIFO location becomes full.
- Bit 17 **RXFIFO**: Receive FIFO full  
This bit is cleared when one FIFO location becomes empty.
- Bit 16 **TXFIFO**: Transmit FIFO full  
This is a hardware status flag only, does not generate an interrupt. This bit is cleared when one FIFO location becomes empty.
- Bit 15 **RXFIFOHF**: Receive FIFO half full  
There are at least half the number of words in the FIFO. This bit is cleared when the FIFO becomes half+1 empty.
- Bit 14 **TXFIFOHE**: Transmit FIFO half empty  
At least half the number of words can be written into the FIFO. This bit is cleared when the FIFO becomes half+1 full.
- Bit 13 **CPSMACT**: Command path state machine active, i.e. not in Idle state  
This is a hardware status flag only, does not generate an interrupt.
- Bit 12 **DPSMACT**: Data path state machine active, i.e. not in Idle state  
This is a hardware status flag only, does not generate an interrupt.
- Bit 11 **DABORT**: Data transfer aborted by CMD12  
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.

- Bit 10 **DBCKEND**: Data block sent/received  
DBCKEND is set when:  
- CRC check passed and DPSM moves to the R\_W state  
or  
- IDMAEN = 0 and transmit data transfer hold and DATACOUNT >0 and DPSM moves to Wait\_S.  
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.
- Bit 9 **DHOLD**: Data transfer Hold  
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.
- Bit 8 **DATAEND**: Data transfer ended correctly  
DATAEND is set if data counter DATACOUNT is zero and no errors occur, and no transmit data transfer hold.  
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.
- Bit 7 **CMDSSENT**: Command sent (no response required)  
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.
- Bit 6 **CMDSREND**: Command response received (CRC check passed, or no CRC)  
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.
- Bit 5 **RXOVERR**: Received FIFO overrun error  
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.
- Bit 4 **TXUNDERR**: Transmit FIFO underrun error  
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.
- Bit 3 **DTIMEOUT**: Data timeout  
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.
- Bit 2 **CTIMEOUT**: Command response timeout  
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.  
The Command Timeout period has a fixed value of 64 SDMMC\_CK clock periods.
- Bit 1 **DCRCFAIL**: Data block sent/received (CRC check failed)  
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.
- Bit 0 **CCRCFAIL**: Command response received (CRC check failed)  
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC\_ICR.

*Note:* FIFO interrupt flags must be masked in SDMMC\_MASKR when using IDMA mode.

### 60.10.12 SDMMC interrupt clear register (SDMMC\_ICR)

Address offset: 0x038

Reset value: 0x0000 0000

The SDMMC\_ICR register is a write-only register. Writing a bit with 1 clears the corresponding bit in the SDMMC\_STAR status register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

1: DCRCFAIL cleared
- Bit 0 **CCRCFAILC**: CCRCFAIL flag clear bit  
Set by software to clear the CCRCFAIL flag.  
0: CCRCFAIL not cleared  
1: CCRCFAIL cleared

### 60.10.13 SDMMC mask register (SDMMC\_MASKR)

Address offset: 0x03C

Reset value: 0x0000 0000

The interrupt mask register determines which status flags generate an interrupt request by setting the corresponding bit to 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:29 Reserved, must be kept at reset value.

- Bit 28 **IDMABTCIE**: IDMA buffer transfer complete interrupt enable  
Set and cleared by software to enable/disable the interrupt generated when the IDMA has transferred all data belonging to a memory buffer.  
0: IDMA buffer transfer complete interrupt disabled  
1: IDMA buffer transfer complete interrupt enabled
- Bit 27 Reserved, must be kept at reset value.
- Bit 26 **CKSTOPIE**: Voltage Switch clock stopped interrupt enable  
Set and cleared by software to enable/disable interrupt caused by Voltage Switch clock stopped.  
0: Voltage Switch clock stopped interrupt disabled  
1: Voltage Switch clock stopped interrupt enabled
- Bit 25 **VSWENDIE**: Voltage switch critical timing section completion interrupt enable  
Set and cleared by software to enable/disable the interrupt generated when voltage switch critical timing section completion.  
0: Voltage switch critical timing section completion interrupt disabled  
1: Voltage switch critical timing section completion interrupt enabled

- Bit 24 **ACKTIMEOUTIE**: Acknowledgment timeout interrupt enable  
Set and cleared by software to enable/disable interrupt caused by acknowledgment timeout.  
0: Acknowledgment timeout interrupt disabled  
1: Acknowledgment timeout interrupt enabled
- Bit 23 **ACKFAILIE**: Acknowledgment Fail interrupt enable  
Set and cleared by software to enable/disable interrupt caused by acknowledgment Fail.  
0: Acknowledgment Fail interrupt disabled  
1: Acknowledgment Fail interrupt enabled
- Bit 22 **SDIOITIE**: SDIO mode interrupt received interrupt enable  
Set and cleared by software to enable/disable the interrupt generated when receiving the SDIO mode interrupt.  
0: SDIO Mode interrupt received interrupt disabled  
1: SDIO Mode interrupt received interrupt enabled
- Bit 21 **BUSYD0ENDIE**: BUSYD0END interrupt enable  
Set and cleared by software to enable/disable the interrupt generated when SDMMC\_D0 signal changes from busy to NOT busy following a CMD response.  
0: BUSYD0END interrupt disabled  
1: BUSYD0END interrupt enabled
- Bits 20:19 Reserved, must be kept at reset value.
- Bit 18 **TXFIFOEIE**: Tx FIFO empty interrupt enable  
Set and cleared by software to enable/disable interrupt caused by Tx FIFO empty.  
0: Tx FIFO empty interrupt disabled  
1: Tx FIFO empty interrupt enabled
- Bit 17 **RXFIFOIE**: Rx FIFO full interrupt enable  
Set and cleared by software to enable/disable interrupt caused by Rx FIFO full.  
0: Rx FIFO full interrupt disabled  
1: Rx FIFO full interrupt enabled
- Bit 16 Reserved, must be kept at reset value.
- Bit 15 **RXFIFOHFIE**: Rx FIFO half full interrupt enable  
Set and cleared by software to enable/disable interrupt caused by Rx FIFO half full.  
0: Rx FIFO half full interrupt disabled  
1: Rx FIFO half full interrupt enabled
- Bit 14 **TXFIFOHEIE**: Tx FIFO half empty interrupt enable  
Set and cleared by software to enable/disable interrupt caused by Tx FIFO half empty.  
0: Tx FIFO half empty interrupt disabled  
1: Tx FIFO half empty interrupt enabled
- Bits 13:12 Reserved, must be kept at reset value.
- Bit 11 **DABORTIE**: Data transfer aborted interrupt enable  
Set and cleared by software to enable/disable interrupt caused by a data transfer being aborted.  
0: Data transfer abort interrupt disabled  
1: Data transfer abort interrupt enabled
- Bit 10 **DBCKENDIE**: Data block end interrupt enable  
Set and cleared by software to enable/disable interrupt caused by data block end.  
0: Data block end interrupt disabled  
1: Data block end interrupt enabled

- Bit 9 **DHOLDIE**: Data hold interrupt enable  
Set and cleared by software to enable/disable the interrupt generated when sending new data is hold in the DPSM Wait\_S state.  
0: Data hold interrupt disabled  
1: Data hold interrupt enabled
- Bit 8 **DATAENDIE**: Data end interrupt enable  
Set and cleared by software to enable/disable interrupt caused by data end.  
0: Data end interrupt disabled  
1: Data end interrupt enabled
- Bit 7 **CMDSSENTIE**: Command sent interrupt enable  
Set and cleared by software to enable/disable interrupt caused by sending command.  
0: Command sent interrupt disabled  
1: Command sent interrupt enabled
- Bit 6 **CMDSRENDIE**: Command response received interrupt enable  
Set and cleared by software to enable/disable interrupt caused by receiving command response.  
0: Command response received interrupt disabled  
1: Command Response received interrupt enabled
- Bit 5 **RXOVERRIE**: Rx FIFO overrun error interrupt enable  
Set and cleared by software to enable/disable interrupt caused by Rx FIFO overrun error.  
0: Rx FIFO overrun error interrupt disabled  
1: Rx FIFO overrun error interrupt enabled
- Bit 4 **TXUNDERRIE**: Tx FIFO underrun error interrupt enable  
Set and cleared by software to enable/disable interrupt caused by Tx FIFO underrun error.  
0: Tx FIFO underrun error interrupt disabled  
1: Tx FIFO underrun error interrupt enabled
- Bit 3 **DTIMEOUTIE**: Data timeout interrupt enable  
Set and cleared by software to enable/disable interrupt caused by data timeout.  
0: Data timeout interrupt disabled  
1: Data timeout interrupt enabled
- Bit 2 **CTIMEOUTIE**: Command timeout interrupt enable  
Set and cleared by software to enable/disable interrupt caused by command timeout.  
0: Command timeout interrupt disabled  
1: Command timeout interrupt enabled
- Bit 1 **DCRCFAILIE**: Data CRC fail interrupt enable  
Set and cleared by software to enable/disable interrupt caused by data CRC failure.  
0: Data CRC fail interrupt disabled  
1: Data CRC fail interrupt enabled
- Bit 0 **CCRCFAILIE**: Command CRC fail interrupt enable  
Set and cleared by software to enable/disable interrupt caused by command CRC failure.  
0: Command CRC fail interrupt disabled  
1: Command CRC fail interrupt enabled

### 60.10.14 SDMMC acknowledgment timer register (SDMMC\_ACKTIMER)

Address offset: 0x040

Reset value: 0x0000 0000

The SDMMC\_ACKTIMER register contains the acknowledgment timeout period, in SDMMC\_CK bus clock periods.

A counter loads the value from the SDMMC\_ACKTIMER register, and starts decrementing when the data path state machine (DPSM) enters the Wait\_Ack state. If the timer reaches 0 while the DPSM is in this states, the acknowledgment timeout status flag is set.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	ACKTIME[24:16]								
							rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ACKTIME[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:0 **ACKTIME[24:0]**: Boot acknowledgment timeout period

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).  
 Boot acknowledgment timeout period expressed in card bus clock periods.

*Note:* The data transfer must be written to the acknowledgment timer register before being written to the data control register.

### 60.10.15 SDMMC data FIFO registers x (SDMMC\_FIFORx)

Address offset: 0x080 + 0x004 \* x, (x =0 to 15)

Reset value: 0x0000 0000

The receive and transmit FIFOs can be only read or written as word (32-bit) wide registers. The FIFOs contain 16 entries on sequential addresses. This enables the CPU to use its load and store multiple operands to read from/write to the FIFO. The FIFO register interface takes care of correct data alignment inside the FIFO, the FIFO register address used by the CPU does matter.

When accessing SDMMC\_FIFOR with half word or byte access an AHB bus fault is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FIFODATA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FIFODATA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **FIFODATA[31:0]**: Receive and transmit FIFO data

This register can only be read or written by firmware when the DPSM is active (DPSMACT = 1).

The FIFO data occupies 16 entries of 32-bit words.

### 60.10.16 SDMMC DMA control register (SDMMC\_IDMACTRLR)

Address offset: 0x050

Reset value: 0x0000 0000

The receive and transmit FIFOs can be read or written as 32-bit wide registers. The FIFOs contain 32 entries on 32 sequential addresses. This enables the CPU to use its load and store multiple operands to read from/write to the FIFO.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IDMAB ACT	IDMAB MODE	IDMA EN
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IDMABACT**: Double buffer mode active buffer indication

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0). When IDMA is enabled this bit is toggled by hardware.

0: When IDMA is enabled, uses buffer0 and firmware write access to IDMABASE0 is prohibited.

1: When IDMA is enabled, uses buffer1 and firmware write access to IDMABASE1 is prohibited.

Bit 1 **IDMABMODE**: Buffer mode selection

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).

0: Single buffer mode.

1: Double buffer mode.

Bit 0 **IDMAEN**: IDMA enable

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).

0: IDMA disabled

1: IDMA enabled

### 60.10.17 SDMMC IDMA buffer size register (SDMMC\_IDMABSIZER)

Address offset: 0x054

Reset value: 0x0000 0000

The SDMMC\_IDMABSIZER register contains the buffers size when in double buffer configuration.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	IDMABNDT[7:0]								4	3	2	1	0
Res.	Res.	Res.	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	Res.	Res.	Res.	Res.	Res.

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:5 **IDMABNDT[7:0]**: Number of bytes per buffer

This 8-bit value must be multiplied by 8 to get the size of the buffer in 32-bit words and by 32 to get the size of the buffer in bytes.

Example: IDMABNDT = 0x01: buffer size = 8 words = 32 bytes.

Example: IDMABNDT = 0x80: buffer size = 1024 words = 4 Kbytes

These bits can only be written by firmware when DPSM is inactive (DPSMACT = 0).

Bits 4:0 Reserved, must be kept at reset value.

### 60.10.18 SDMMC IDMA buffer 0 base address register (SDMMC\_IDMABASE0R)

Address offset: 0x058

Reset value: 0x0000 0000

The SDMMC\_IDMABASE0R register contains the memory buffer base address in single buffer configuration and the buffer 0 base address in double buffer configuration.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IDMABASE0[31:16]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDMABASE0[15:0]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r	r

Bits 31:0 **IDMABASE0[31:0]**: Buffer 0 memory base address bits [31:2], must be word aligned (bit [1:0] are always 0 and read only)

This register can be written by firmware when DPSM is inactive (DPSMACT = 0), and can dynamically be written by firmware when DPSM active (DPSMACT = 1) and memory buffer 0 is inactive (IDMABACT = '1').

### 60.10.19 SDMMC IDMA buffer 1 base address register (SDMMC\_IDMABASE1R)

Address offset: 0x05C

Reset value: 0x0000 0000

The SDMMC\_IDMABASE1R register contains the double buffer configuration second buffer memory base address.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IDMABASE1[31:16]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDMABASE1[15:0]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	r	r

Bits 31:0 **IDMABASE1[31:0]**: Buffer 1 memory base address, must be word aligned (bit [1:0] are always 0 and read only)

This register can be written by firmware when DPSM is inactive (DPSMACT = 0), and can dynamically be written by firmware when DPSM active (DPSMACT = 1) and memory buffer 1 is inactive (IDMABACT = '0').

Refer to [Section 2.3 on page 129](#) for the register boundary addresses.

## 61 Controller area network with flexible data rate (FDCAN)

### 61.1 Introduction

The controller area network (CAN) subsystem (see [Figure 702](#)) consists of two CAN modules, a shared message RAM and a clock calibration unit. Refer to the product memory organization for the base address of each of them.

FDCAN modules are compliant with ISO 11898-1: 2015 (CAN protocol specification version 2.0 part A, B) and CAN FD protocol specification version 1.0.

In addition, the first CAN module FDCAN1 supports time triggered CAN (TTCAN), specified in ISO 11898-4, including event synchronized time-triggered communication, global system time, and clock drift compensation. The FDCAN1 contains additional registers, specific to the time triggered feature. The CAN FD option can be used together with event-triggered and time-triggered CAN communication.

A 10 Kbyte message RAM implements filters, receive FIFOs, receive buffers, transmit event FIFOs, transmit buffers (and triggers for TTCAN). This message RAM is shared between the FDCAN modules.

The common clock calibration unit is optional. It can be used to generate a calibrated clock for each FDCAN from the HSI internal RC oscillator and the PLL, by evaluating CAN messages received by the FDCAN1.

The CAN subsystem I/O signals and pins are detailed, respectively, in [Table 467](#) and [Table 468](#).

**Table 467. CAN subsystem I/O signals**

Name	Type	Description
fdcan_ker_ck	Digital input	CAN subsystem kernel clock input
fdcan_pclk		CAN subsystem APB interface clock input
fdcan_cal_it	Digital output	FDCAN calibration interrupt
fdcan1_intr0_it	Digital output	FDCAN1 interrupt0
fdcan1_intr1_it		FDCAN1 interrupt1
fdcan2_intr0_it	Digital output	FDCAN2 interrupt0
fdcan2_intr1_it		FDCAN2 interrupt1
fdcan1_swt[0:3]	Digital input	Stop watch trigger input
fdcan1_evt[0:3]		Event trigger input
fdcan1_ts[0:15]		External timestamp vector
fdcan1_soc	Digital output	Start of cycle pulse
fdcan1_rtp		Register time mark pulse
fdcan1_tmp		Trigger time mark pulse

Table 468. CAN subsystem I/O pins

Name	Type	Description
FDCAN1_RX	Digital input	FDCAN1 receive pin
FDCAN1_TX	Digital output	FDCAN1 transmit pin
FDCAN2_RX	Digital input	FDCAN2 receive pin
FDCAN2_TX	Digital output	FDCAN2 transmit pin

Table 469. CAN triggers

Type	ID	Source	Destination
Internal	SWT0	TIM2_TGO_CKTIM	-
	SWT1	TIM3_TGO_CKTIM	-
	SWT2	-	-

MS51729V1

## 61.2 FDCAN main features

- Conform with CAN protocol version 2.0 part A, B and ISO 11898-1: 2015, -4
- CAN FD with max. 64 data bytes supported
- TTCAN protocol level 1 and level 2 completely in hardware (FDCAN1 only)
- Event synchronized time-triggered communication supported (FDCAN1 only)
- CAN error logging
- AUTOSAR and J1939 support
- Improved acceptance filtering
- Two configurable receive FIFOs
- Separate signaling on reception of high priority messages
- Up to 64 dedicated receive buffers
- Up to 32 dedicated transmit buffers
- Configurable transmit FIFO / queue
- Configurable transmit event FIFO
- FDCAN modules share the same message RAM
- Programmable loop-back test mode
- Maskable module interrupts
- Two clock domains: APB bus interface and CAN core kernel clock
- Power-down support

## 61.3 FDCAN implementation

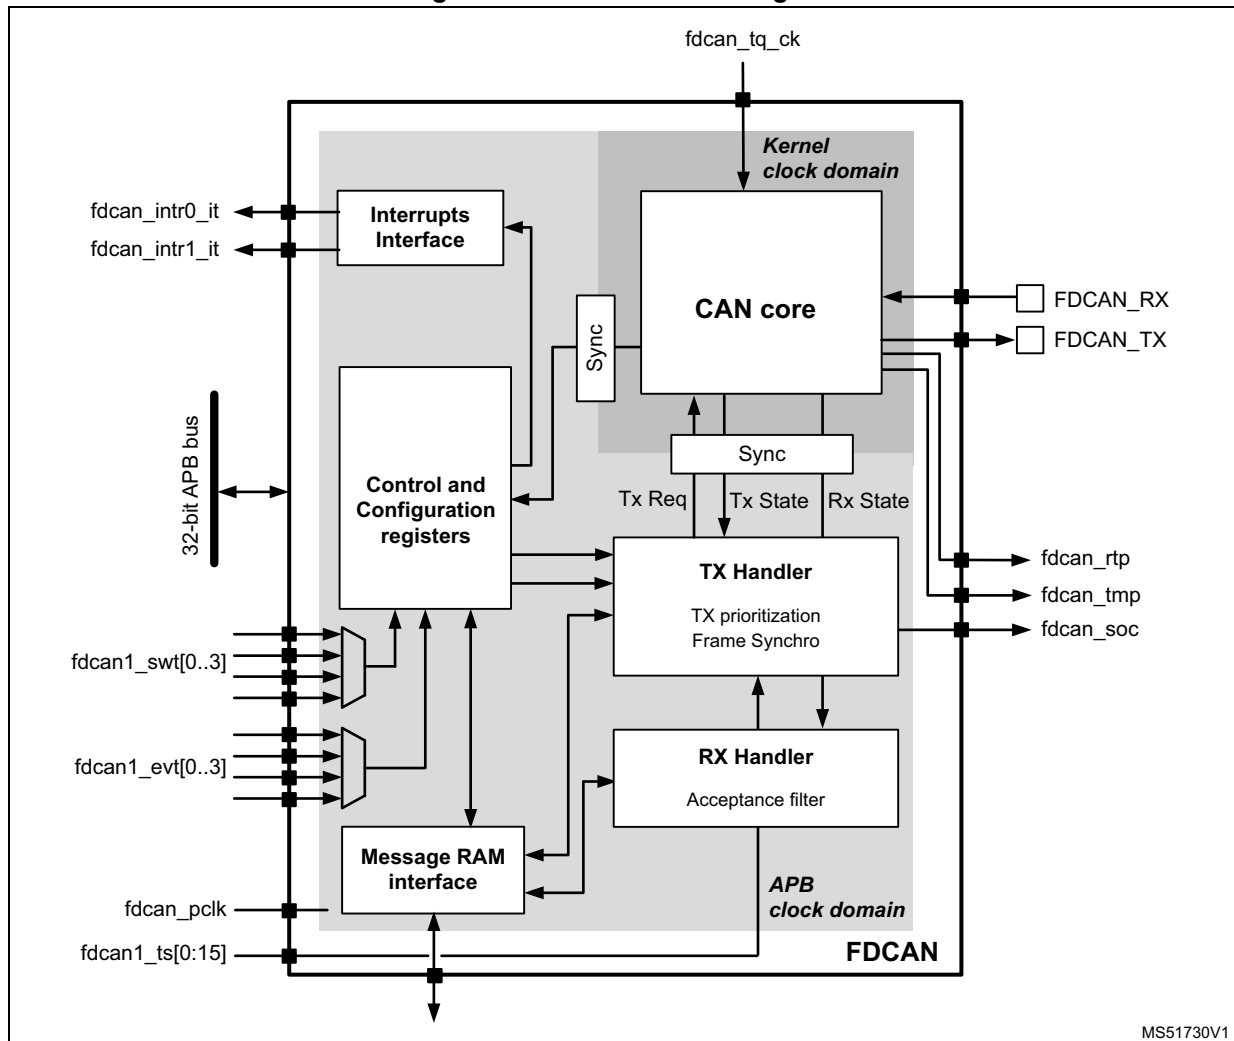

Table 470. Main features

Module	FDCAN1	FDCAN2
TTCAN	X	-

## 61.4 FDCAN functional description

Figure 703. FDCAN block diagram

MS51730V1

### Dual interrupt lines

The FDCAN peripheral provides two interrupt lines **fdcan\_intr0\_it** and **fdcan\_intr1\_it**. By programming **EINT0** and **EINT1** bits in **FDCAN\_ILE** register, the interrupt lines can be enabled or disabled separately.

### CAN core

The CAN core contains the protocol controller and receive/transmit shift registers. It handles all ISO 11898-1: 2015 protocol functions and supports both 11-bit and 29-bit identifiers.

### Sync

The sync block synchronizes signals from the APB clock domain to the CAN kernel clock domain and vice versa.

### Tx handler

Controls the message transfer from the message RAM to the CAN core. A maximum of 32 Tx buffers can be configured for transmission. Tx buffers can be used as dedicated Tx buffers, as Tx FIFO, part of a Tx queue, or as a combination of them. A Tx event FIFO stores Tx timestamps together with the corresponding message ID. Transmit cancellation is also supported.

On FDCAN1, the Tx handler also implements the frame synchronization entity (FSE) which controls time-triggered communication according to ISO11898-4. It synchronizes itself with the reference messages on the CAN bus, controls cycle time and global time, and handles transmissions according to the predefined message schedule, the system matrix. It also handles the time marks of the system matrix that are linked to the messages in the message RAM. Stop watch trigger, event trigger, and time mark interrupt are synchronization interfaces.

### Rx handler

Controls the transfer of received messages from the CAN core to the external message RAM. The Rx handler supports two receive FIFOs, each of configurable size, and up to 64 dedicated Rx buffers for storage of all messages that have passed acceptance filtering. A dedicated Rx buffer, in contrast to a receive FIFO, is used to store only messages with a specific identifier. An Rx timestamp is stored together with each message. Up to 128 filters can be defined for 11-bit IDs and up to 64 filters for 29-bit IDs.

### APB Interface

Connects the FDCAN to the APB bus.

### Message RAM Interface

Connects the FDCAN access to an external 10 Kbytes message RAM through a RAM controller/arbitrator.

## 61.4.1 Operating modes

### Software initialization

Software initialization is started by setting INIT bit in FDCAN\_CCCR register, either by software or by a hardware reset, or by going Bus\_Off. While INIT bit in FDCAN\_CCCR register is set, message transfer from and to the CAN bus is stopped, the status of the CAN bus output FDCAN\_TX is recessive (high). The counters of the error management logic (EML) are unchanged. Setting INIT bit in FDCAN\_CCCR does not change any configuration register. Clearing INIT bit in FDCAN\_CCCR finishes the software initialization. Afterwards the bit stream processor (BSP) synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits (Bus\_Idle) before it can take part in bus activities and start the message transfer.

Access to the FDCAN configuration registers is only enabled when both INIT bit in FDCAN\_CCCR register and CCE bit in FDCAN\_CCCR register are set.

CCE bit in FDCAN\_CCCR register can only be set/cleared while INIT bit in FDCAN\_CCCR is set. CCE bit in FDCAN\_CCCR register is automatically cleared when INIT bit in FDCAN\_CCCR is cleared.

The following registers are reset when CCE bit in FDCAN\_CCCR register is set:

- FDCAN\_HPMS - high priority message status
- FDCAN\_RXF0S - Rx FIFO 0 status
- FDCAN\_RXF1S - Rx FIFO 1 status
- FDCAN\_TXFQS - Tx FIFO/queue status
- FDCAN\_TXBRP - Tx buffer request pending
- FDCAN\_TXBTO - Tx buffer transmission occurred
- FDCAN\_TXBCF - Tx buffer cancellation finished
- FDCAN\_TXEFS - Tx event FIFO status
- FDCAN\_TTOST - TT (time trigger) operation status (FDCAN1 only)
- FDCAN\_TTLGT - TT local and global time, only global time FDCAN\_TTLGT.GT is reset (FDCAN1 only)
- FDCAN\_TTCTC - TT cycle time and count (FDCAN1 only)
- FDCAN\_TTCSM - TT cycle sync mark (FDCAN1 only)

The timeout counter value TOC bit in FDCAN\_TOCV register is preset to the value configured by TOP bit in FDCAN\_TOCC register when CCE bit in FDCAN\_CCCR is set.

In addition the state machines of the Tx handler and Rx handler are held in idle state while CCE bit in FDCAN\_CCCR is set.

The following registers can be written only when CCE bit in FDCAN\_CCCR register is cleared:

- FDCAN\_TXBAR - Tx buffer add request
- FDCAN\_TXBCR - Tx buffer cancellation request

TEST bit in FDCAN\_CCCR and MON bit in FDCAN\_CCCR can only be set by software while both INIT bit and CCE bit in FDCAN\_CCCR register are set. Both bits may be reset at any time. DAR bit in FDCAN\_CCCR can only be set/cleared while both INIT bit in FDCAN\_CCCR and CCE bit in FDCAN\_CCCR are set.

### Normal operation

The FDCAN1 default operating mode after hardware reset is event-driven CAN communication without time triggers (FDCAN\_TTOCF.OM = 00). It is required that both INIT bit and CCE bit in FDCAN\_CCCR register are set before the TT operation mode can be changed.

Once the FDCAN is initialized and INIT bit in FDCAN\_CCCR register is cleared, the FDCAN synchronizes itself to the CAN bus and is ready for communication.

After passing the acceptance filtering, received messages including message ID and DLC are stored into a dedicated Rx buffer or into the Rx FIFO 0 or Rx FIFO 1.

For messages to be transmitted dedicated Tx buffers and/or a Tx FIFO or a Tx queue can be initialized or updated. Automated transmission on reception of remote frames is not supported.

### CAN FD operation

There are two variants in the CAN FD protocol, first the long frame mode (LFM) where the data field of a CAN frame may be longer than eight bytes. The second variant is the fast frame mode (FFM) where control field, data field, and CRC field of a CAN frame are

transmitted with a higher bitrate than the beginning and the end of the frame. Fast frame mode can be used in combination with long frame mode.

The previously reserved bit in CAN frames with 11-bit identifiers and the first previously reserved bit in CAN frames with 29-bit identifiers are now decoded as FDF bit. FDF recessive signifies a CAN FD frame, while FDF dominant signifies a classic CAN frame. In a CAN FD frame, the two bits following FDF, res and BRS, decide whether the bitrate inside this CAN FD frame is switched. A CAN FD bitrate switch is signified by res dominant and BRS recessive. The coding of res recessive is reserved for future expansion of the protocol. If the FDCAN receives a frame with FDF recessive and res recessive, it signals a protocol exception event by setting bit FDCAN\_PSR.PXE. When protocol exception handling is enabled (FDCAN\_CCCR.PXHD = 0), this causes the operation state to change from receiver (FDCAN\_PSR.ACT = 10) to Integrating (FDCAN\_PSR.ACT = 00) at the next sample point. In case protocol exception handling is disabled (FDCAN\_CCCR.PXHD = 1), the FDCAN treats a recessive res bit as a form error and responds with an error frame.

CAN FD operation is enabled by programming FDCAN\_CCCR.FDOE. If FDCAN\_CCCR.FDOE = 1, transmission and reception of CAN FD frames is enabled. Transmission and reception of classic CAN frames is always possible. Whether a CAN FD frame or a classic CAN frame is transmitted can be configured via bit FDF in the respective Tx buffer element. With FDCAN\_CCCR.FDOE = 0, received frames are interpreted as classic CAN frames, which leads to the transmission of an error frame when receiving a CAN FD frame. When CAN FD operation is disabled, no CAN FD frames are transmitted, even if bit FDF of a Tx buffer element is set. FDCAN\_CCCR.FDOE and FDCAN\_CCCR.BRSE can only be changed while FDCAN\_CCCR.INIT and FDCAN\_CCCR.CCE are both set.

With FDCAN\_CCCR.FDOE = 0, the setting of bits FDF and BRS is ignored and frames are transmitted in classic CAN format. With FDCAN\_CCCR.FDOE = 1 and FDCAN\_CCCR.BRSE = 0, only bit FDF of a Tx buffer element is evaluated. With FDCAN\_CCCR.FDOE = 1 and FDCAN\_CCCR.BRSE = 1, transmission of CAN FD frames with bitrate switching is enabled. All Tx buffer elements with bits FDF and BRS set are transmitted in CAN FD format with bitrate switching.

A mode change during CAN operation is only recommended under the following conditions:

- The failure rate in the CAN FD data phase is significant higher than in the CAN FD arbitration phase. In this case disable the CAN FD bitrate switching option for transmissions.
- During system startup all nodes are transmitting classic CAN messages until it is verified that they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD operation.
- Wake-up messages in CAN partial networking have to be transmitted in classic CAN format.
- End-of-line programming in case not all nodes are CAN FD capable. Non CAN FD nodes are held in Silent mode until programming has completed. Then all nodes switch back to classic CAN communication.

In the CAN FD format, the coding of the DLC differs from the standard CAN format. DLC codes 0 to 8 have the same coding as in standard CAN, codes 9 to 15 (that in standard CAN all code a data field of 8 bytes) are coded according to [Table 471](#).

Table 471. DLC coding in FDCAN

DLC	9	10	11	12	13	14	15
Number of data bytes	12	16	20	24	32	48	64

In CAN FD fast frames, the bit timing is switched inside the frame, after the BRS (bitrate Switch) bit, if this bit is recessive. Before the BRS bit, in the CAN FD arbitration phase, the nominal CAN bit timing is used as defined by the bit timing and prescaler register FDCAN\_NBTP. In the following CAN FD data phase, the fast CAN bit timing is used as defined by the fast bit timing and prescaler register FDCAN\_DBTP. The bit timing is switched back from the fast timing at the CRC delimiter or when an error is detected, whichever occurs first.

The maximum configurable bitrate in the CAN FD data phase depends on the FDCAN kernel clock frequency. For example, with a FDCAN kernel clock frequency of 20 MHz and the shortest configurable bit time of four time quanta (t<sub>q</sub>), the bitrate in the data phase is 5 Mbit/s.

In both data frame formats, CAN FD long frames and CAN FD fast frames, the value of the bit ESI (error status indicator) is determined by the transmitter error state at the start of the transmission. If the transmitter is error passive, ESI is transmitted recessive, else it is transmitted dominant. In CAN FD remote frames the ESI bit is always transmitted dominant, independent of the transmitter error state. The data length code of CAN FD remote frames is transmitted as 0.

In case a FDCAN Tx buffer is configured for CAN FD transmission with DLC > 8, the first eight bytes are transmitted as configured in the Tx buffer while the remaining part of the data field is padded with 0xCC. When the FDCAN receives a FDCAN frame with DLC > 8, the first eight bytes of that frame are stored into the matching Rx buffer or Rx FIFO. The remaining bytes are discarded.

### Transceiver delay compensation

During the data phase of a CAN FD transmission only one node is transmitting, all others are receivers. The length of the bus line has no impact. When transmitting via pin FDCAN\_TX the protocol controller receives the transmitted data from its local CAN transceiver via pin FDCAN\_RX. The received data is delayed by the CAN transceiver loop delay. In case this delay is greater than TSEG1 (time segment before sample point), a bit error is detected. Without transceiver delay compensation, the bitrate in the data phase of a CAN FD frame is limited by the transceivers loop delay.

The FDCAN implements a delay compensation mechanism to compensate the CAN transceiver loop delay, thereby enabling transmission with higher bitrates during the CAN FD data phase independent of the delay of a specific CAN transceiver.

To check for bit errors during the data phase of transmitting nodes, the delayed transmit data is compared against the received data at the Secondary Sample Point SSP. If a bit error is detected, the transmitter reacts on this bit error at the next following regular sample point. During arbitration phase the delay compensation is always disabled.

The transmitter delay compensation enables configurations where the data bit time is shorter than the transmitter delay, it is described in detail in the new ISO11898-1. It is enabled by setting bit FDCAN\_DBTP.TDC.

The received bit is compared against the transmitted bit at the SSP. The SSP position is defined as the sum of the measured delay from the FDCAN transmit output pin FDCAN\_TX through the transceiver to the receive input pin FDCAN\_RX plus the transmitter delay compensation offset as configured by FDCAN\_TDCR.TDCO. The transmitter delay compensation offset is used to adjust the position of the SSP inside the received bit (for example half of the bit time in the data phase). The position of the secondary sample point is rounded down to the next integer number of mtq (minimum time quantum, that is one period of fdcan\_tq\_ck clock).

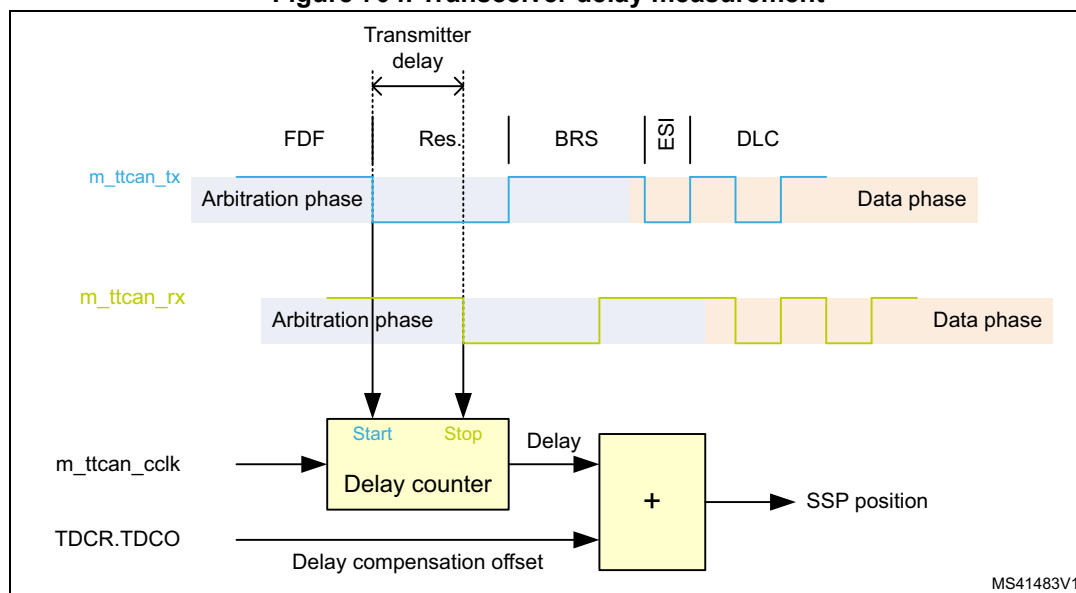

FDCAN\_PSR.TDCV shows the actual transmitter delay compensation value, it is cleared when FDCAN\_CCCR.INIT is set and is updated at each transmission of an FD frame while FDCAN\_DBTP.TDC is set.

The following boundary conditions have to be considered for the transmitter delay compensation implemented in the FDCAN:

- The sum of the measured delay from FDCANx\_TX to FDCANx\_RX and the configured transmitter delay compensation offset FDCAN\_TDCR.TDCO must be less than six bit times in the data phase.
- The sum of the measured delay from FDCANx\_TX to FDCANx\_RX and the configured transmitter delay compensation offset FDCAN\_TDCR.TDCO must be less than or equal to 127 mtq. If this sum exceeds 127 mtq, the maximum value (127 mtq) is used for transmitter delay compensation.
- The data phase ends at the sample point of the CRC delimiter, that stops checking received bits at the SSPs

If transmitter delay compensation is enabled by programming FDCAN\_DBTP.TDC = 1, the measurement is started within each transmitted CAN FD frame at the falling edge of bit FDF to bit res. The measurement is stopped when this edge is seen at the receive input pin FDCAN\_TX of the transmitter. The resolution of this measurement is one mtq.

Figure 704. Transceiver delay measurement

To avoid that a dominant glitch inside the received FDF bit ends the delay compensation measurement before the falling edge of the received res bit (resulting in a too early SSP position) the use of a transmitter delay compensation filter window can be enabled by

programming FDCAN\_TDCR.TDCF. This defines a minimum value for the SSP position. Dominant edges on FDCANx\_RX, that would result in an earlier SSP position are ignored for transmitter delay measurement. The measurement is stopped when the SSP position is at least FDCAN\_TDCR.TDCF and FDCAN\_RX is low.

### Restricted operation mode

In restricted operation mode the node is able to receive data and remote frames and to give acknowledge to valid frames, but it does not send data frames, remote frames, active error frames, or overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The error counters (FDCAN\_ECR.REC, FDCAN\_ECR.TEC) are frozen while error logging (FDCAN\_ECR.CEL) is active. The software can set the FDCAN into restricted operation mode by setting bit FDCAN\_CCCR.ASM. The bit can only be set by software when both FDCAN\_CCCR.CCE and FDCAN\_CCCR.INIT are set to 1. The bit can be cleared by software at any time.

Restricted operation mode is automatically entered when the Tx handler was not able to read data from the message RAM in time. To leave restricted operation mode, the software has to reset FDCAN\_CCCR.ASM.

The restricted operation mode can be used in applications that adapt themselves to different CAN bitrates. In this case the application tests different bitrates and leaves the restricted operation mode after it has received a valid frame.

FDCAN\_CCCR.ASM is also controlled by the clock calibration unit. When the clock calibration process is enabled, the restricted operation mode is entered and the FDCAN\_CCR.ASM bit is set. Once the calibration is completed, FDCAN\_CCR.ASM bit is cleared.

*Note:* The restricted operation mode must not be combined with the loop back mode (internal or external).

### Bus monitoring mode

The FDCAN is set in bus monitoring mode by setting FDCAN\_CCCR.MON bit or when error level S3 (FDCAN\_TTOST.EL = 11) is entered. In bus monitoring mode (For more details refer to ISO11898-1, 10.12 bus monitoring), the FDCAN is able to receive valid data frames and valid remote frames, but cannot start a transmission. In this mode, it sends only recessive bits on the CAN bus, if the FDCAN is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is rerouted internally so that the FDCAN monitors this dominant bit, although the CAN bus may remain in recessive state. In bus monitoring mode register FDCAN\_TXBRP is held in reset state.

The bus monitoring mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. [Figure 705](#) shows the connection of FDCAN\_TX and FDCAN\_RX signals to the FDCAN in bus monitoring mode.

Figure 705. Pin control in bus monitoring mode

### Disabled automatic retransmission (DAR) mode

According to the CAN Specification (see ISO11898-1, 6.3.3 recovery management), the FDCAN provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default automatic retransmission is enabled.

To support time-triggered communication as described in ISO 11898-1: 2015, chapter 9.2, the automatic retransmission may be disabled via FDCAN\_CCCR.DAR.

### Frame transmission in disabled automatic retransmission (DAR) mode

In DAR mode all transmissions are automatically canceled after they started on the CAN bus. A Tx buffer Tx request pending bit FDCAN\_TXBRP.TRPx is reset after successful transmission, when a transmission has not yet been started at the point of cancellation, has been aborted due to lost arbitration, or when an error occurred during frame transmission.

- Successful transmission:
  - Corresponding Tx buffer transmission occurred bit FDCAN\_TXBTO.TOx set
  - Corresponding Tx buffer cancellation finished bit FDCAN\_TXBCF.CFx not set
- Successful transmission in spite of cancellation:
  - Corresponding Tx buffer transmission occurred bit FDCAN\_TXBTO.TOx set
  - Corresponding Tx buffer cancellation finished bit FDCAN\_TXBCF.CFx set
- Arbitration loss or frame transmission disturbed:
  - Corresponding Tx buffer transmission occurred bit FDCAN\_TXBTO.TOx not set
  - Corresponding Tx buffer cancellation finished bit FDCAN\_TXBCF.CFx set

In case of a successful frame transmission, and if storage of Tx events is enabled, a Tx event FIFO element is written with event type ET = 10 (transmission in spite of cancellation).

### Power down (Sleep mode)

The FDCAN can be set into power down mode controlled by clock stop request input via register FDCAN\_CCCR.CSR. As long as the clock stop request is active, bit FDCAN\_CCCR.CSR is read as 1.

When all pending transmission requests have completed, the FDCAN waits until bus idle state is detected. Then the FDCAN sets FDCAN\_CCCR.INIT to 1 to prevent any further CAN transfers. Now the FDCAN acknowledges that it is ready for power down by setting FDCAN\_CCCR.CSA to 1. In this state, before the clocks are switched off, further register accesses can be made. A write access to FDCAN\_CCCR.INIT has no effect. Now the module clock inputs may be switched off.

To leave power down mode, the application has to turn on the module clocks before resetting CC control register flag FDCAN\_CCCR.CSR. The FDCAN acknowledges this by resetting FDCAN\_CCCR.CSA. Afterwards, the application can restart CAN communication by resetting bit FDCAN\_CCCR.INIT.

### Test modes

To enable write access to FDCAN test register (see [Section 61.5.4](#)), bit FDCAN\_CCCR.TEST must be set to 1, thus enabling the configuration of test modes and functions.

Four output functions are available for the CAN transmit pin FDCAN\_TX by programming FDCAN\_TEST.TX. Additionally to its default function – the serial data output – it can drive the CAN Sample Point signal to monitor the FDCAN bit timing and it can drive constant dominant or recessive values. The actual value at pin FDCAN\_RX can be read from FDCAN\_TEST.RX. Both functions can be used to check the CAN bus physical layer.

Due to the synchronization mechanism between CAN kernel clock and APB clock domain, there may be a delay of several APB clock periods between writing to FDCAN\_TEST.TX until the new configuration is visible at FDCAN\_TX output pin. This applies also when reading FDCAN\_RX input pin via FDCAN\_TEST.RX.

*Note: Test modes should be used for production tests or self test only. The software control for FDCAN\_TX pin interferes with all CAN protocol functions. It is not recommended to use test modes for application.*

### External loop back mode

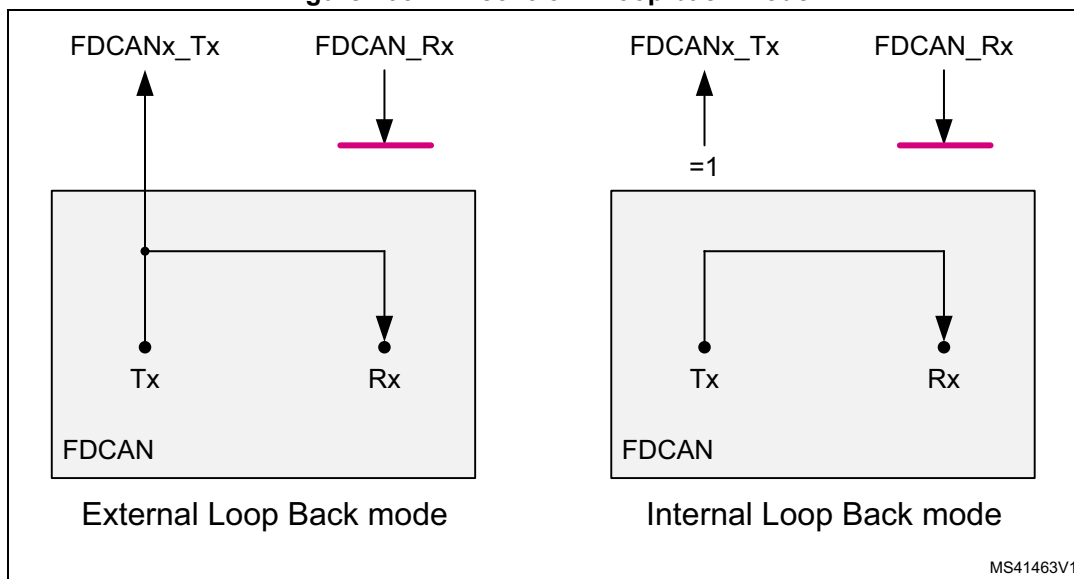

The FDCAN can be set in external loop back mode by programming FDCAN\_TEST.LBCK to 1. In loop back mode, the FDCAN treats its own transmitted messages as received messages and stores them (if they pass acceptance filtering) into Rx FIFOs. [Figure 706](#) (left side) shows the connection of transmit and receive signals FDCAN\_TX and FDCAN\_RX to the FDCAN in external loop back mode.

This mode is provided for hardware self-test. To be independent from external stimulation, the FDCAN ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/remote frame) in loop back mode. In this mode the FDCAN performs an internal feedback from its transmit output to its receive input. The actual value of the FDCAN\_RX input pin is disregarded by the FDCAN. The transmitted messages can be monitored at the FDCAN\_TX transmit pin.

### Internal loop back mode

Internal loop back mode is entered by programming bits FDCAN\_TEST.LBCK and FDCAN\_CCCR.MON to 1. This mode can be used for a “Hot Selftest”, meaning the FDCAN can be tested without affecting a running CAN system connected to the FDCAN\_TX and FDCAN\_RX pins. In this mode, FDCAN\_RX pin is disconnected from the FDCAN and FDCAN\_TX pin is held recessive. [Figure 706](#) (right side) shows the connection of FDCAN\_TX and FDCAN\_RX pins to the FDCAN in case of internal loop back mode.

Figure 706. Pin control in loop back mode

### Application watchdog (FDCAN1 only)

The application watchdog is served by reading register FDCAN\_TTOST. When the application watchdog is not served in time, bit FDCAN\_TTOST.AWE is set, all TTCAN communication is stopped, and the FDCAN1 is set into bus monitoring mode.

The TT application watchdog can be disabled by programming the application watchdog limit FDCAN\_TTOCF.AWL to 0x00. The TT application watchdog should not be disabled in a TTCAN application program

### Timestamp generation

For timestamp generation the FDCAN supplies a 16-bit wraparound counter. A prescaler FDCAN\_TSCC.TCP can be configured to clock the counter in multiples of CAN bit times (1 ... 16). The counter is readable via FDCAN\_TSCV.TCV. A write access to register FDCAN\_TSCV resets the counter to 0. When the timestamp counter wraps around interrupt flag FDCAN\_IR.TSW is set.

On start of frame reception/transmission the counter value is captured and stored into the timestamp section of a Rx buffer/Rx FIFO (RXTS[15:0]) or Tx event FIFO (TXTS[15:0]) element.

By programming bit FDCAN\_TSCC.TSS, a 16-bit timestamp can be used.

### Timeout counter

To signal timeout conditions for Rx FIFO 0, Rx FIFO 1, and the Tx event FIFO the FDCAN supplies a 16-bit timeout counter. It operates as down-counter and uses the same prescaler controlled by FDCAN\_TSCC.TCP as the timestamp counter. The timeout counter is configured via register FDCAN\_TOCC. The actual counter value can be read from FDCAN\_TOCV.TOC. The timeout counter can only be started while FDCAN\_CCCR.INIT = 0. It is stopped when FDCAN\_CCCR.INIT = 1, for example when the FDCAN enters Bus\_Off state.

The operation mode is selected by FDCAN\_TOCC.TOS. When operating in Continuous mode, the counter starts when FDCAN\_CCCR.INIT is reset. A write to FDCAN\_TOCV

presets the counter to the value configured by FDCAN\_TOCC.TOP and continues down-counting.

When the timeout counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by FDCAN\_TOCC.TOP. Down-counting is started when the first FIFO element is stored. Writing to FDCAN\_TOCV has no effect.

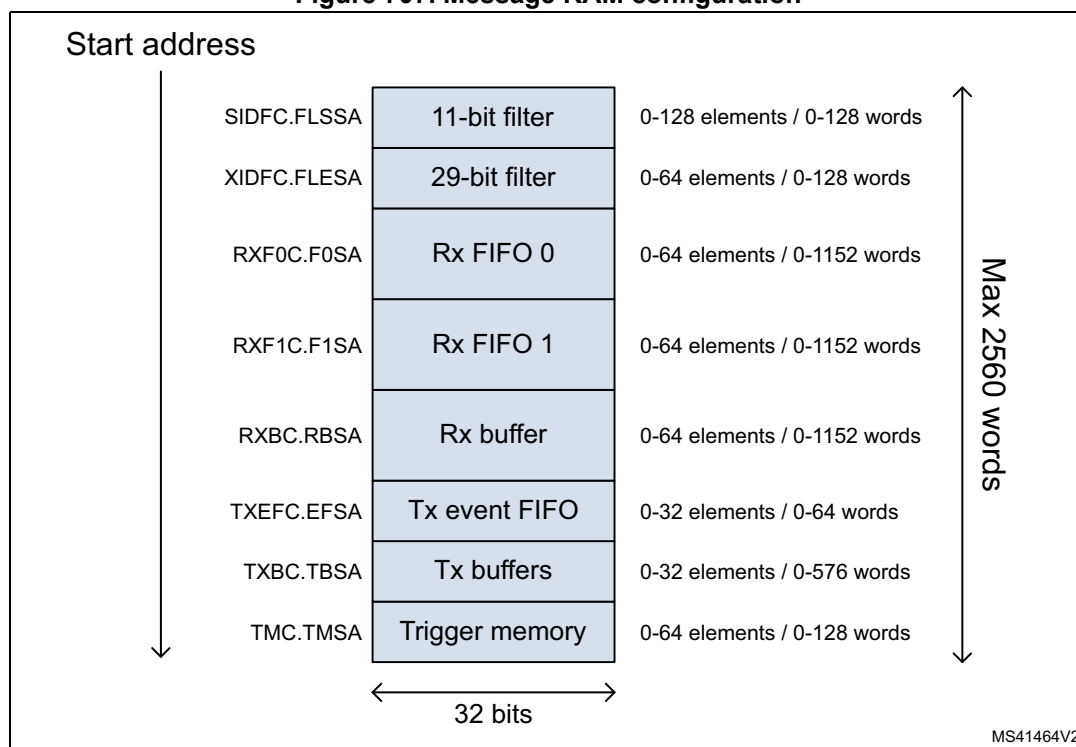

When the counter reaches 0, interrupt flag FDCAN\_IR.TOO is set. In Continuous mode, the counter is immediately restarted at FDCAN\_TOCC.TOP.

*Note: The clock signal for the timeout counter is derived from the CAN core sample point signal. Therefore the point in time where the timeout counter is decremented may vary due to the synchronization/re-synchronization mechanism of the CAN core. If the baudrate switch feature in FDCAN is used, the timeout counter is clocked differently in arbitration and data fields.*

### 61.4.2 Message RAM

The message RAM has a width of 32 bits. The FDCAN module can be configured to allocate up to 2560 words in the message RAM. It is not necessary to configure each of the sections listed in [Figure 707](#), nor is there any restriction with respect to the sequence of the sections.

**Figure 707. Message RAM configuration**

When the FDCAN addresses the message RAM it addresses 32-bit words, not single bytes. The configured start addresses are 32-bit word addresses, i.e. only bits 15 to 2 are evaluated, the two least significant bits are ignored.

*Note:* The FDCAN does not check for erroneous configuration of the message RAM. In particular, the configuration of the start addresses of the different sections and the number of elements of each section must be done carefully to avoid falsification or loss of data.

## Rx handling

The Rx handler controls the acceptance filtering, the transfer of received messages to Rx buffers or to 1 of the two Rx FIFOs, as well as the Rx FIFO put and get Indices.

## Acceptance filter

The FDCAN offers the possibility to configure two sets of acceptance filters, one for standard identifiers and one for extended identifiers. These filters can be assigned to Rx buffer, Rx FIFO 0 or Rx FIFO 1. For acceptance filtering each list of filters is executed from element #0 until the first matching element. Acceptance filtering stops at the first matching element. The following filter elements are not evaluated for this message.

The main features are:

- Each filter element can be configured as
  - range filter (from 0 to 128 elements for the 11-bit filter and from 0 to 64 for the 29-bit filter)
  - filter for one or two dedicated IDs
  - classic bit mask filter
- Each filter element is configurable for acceptance or rejection filtering
- Each filter element can be enabled/disabled individually
- Filters are checked sequentially, execution stops with the first matching filter element

Related configuration registers are:

- Global filter configuration (FDCAN\_GFC)
- Standard ID filter configuration (FDCAN\_SIDFC)
- Extended ID filter configuration (FDCAN\_XIDFC)
- Extended ID AND Mask (FDCAN\_XIDAM)

Depending on the configuration of the filter element (SFEC / EFEC) a match triggers one of the following actions:

- Store received frame in FIFO 0 or FIFO 1
- Store received frame in Rx buffer
- Store received frame in Rx buffer and generate pulse at filter event pin
- Reject received frame
- Set high priority message interrupt flag FDCAN\_IR.HPM
- Set high priority message interrupt flag FDCAN\_IR.HPM and store received frame in FIFO 0 or FIFO 1
- Set high priority message interrupt flag FDCAN\_IR.HPM and store received frame in FIFO 0 or FIFO 1

Acceptance filtering is started after the complete identifier has been received. After acceptance filtering has completed, and if a matching Rx buffer or Rx FIFO has been found, the message handler starts writing the received message data in 32-bit portions to the

matching Rx buffer or Rx FIFO. If the CAN protocol controller has detected an error condition (for example CRC error), this message is discarded with the following impact:

- **Rx buffer**  
New data flag of matching Rx buffer is not set, but Rx buffer (partly) overwritten with received data. For error type see FDCAN\_PSR.LEC and FDCAN\_PSR.DLEC.
- **Rx FIFO**  
Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data. For error type see FDCAN\_PSR.LEC and FDCAN\_PSR.DLEC. In case the matching Rx FIFO is operated in overwrite mode, the boundary conditions described in *Rx FIFO overwrite mode* have to be considered.

*Note:* When an accepted message is written to one of the two Rx FIFOs, or into an Rx buffer, the unmodified received identifier is stored independently of the filter(s) used. The result of the acceptance filter process depends strongly upon the sequence of configured filter elements.

### Range filter

The filter matches for all received frames with message IDs in the range defined by SF1ID / SF2ID and EF1ID / EF2ID.

There are two possibilities when range filtering is used together with extended frames:

- EFT = 00: The message ID of received frames is AND-ed with the extended ID AND Mask (FDCAN\_XIDAM) before the range filter is applied
- EFT = 11: The extended ID AND Mask (FDCAN\_XIDAM) is not used for range filtering

### Filter for dedicated IDs

A filter element can be configured to filter for one or two specific message IDs. To filter for one specific message ID, the filter element must be configured with SF1ID = SF2ID and EF1ID = EF2ID.

### Classic bit mask filter

Classic bit mask filtering is intended to filter groups of message IDs by masking single bits of a received message ID. With classic bit mask filtering SF1ID / EF1ID is used as message ID filter, while SF2ID / EF2ID is used as filter mask.

A 0 bit at the filter mask masks out the corresponding bit position of the configured ID filter, for example the value of the received message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received message ID where the corresponding mask bits are one are relevant for acceptance filtering.

In case all mask bits are one, a match occurs only when the received message ID and the message ID filter are identical. If all mask bits are 0, all message IDs match.

### Standard message ID filtering

Figure 708 shows the flow for standard message ID (11-bit Identifier) filtering. The standard message ID filter element is described in Section 61.4.21.

Figure 708. Standard message ID filter path

Controlled by the global filter configuration (FDCAN\_GFC) and the standard ID filter configuration (FDCAN\_SIDFC) message ID, remote transmission request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

### Extended message ID filtering

Figure 709 shows the flow for extended message ID (29-bit Identifier) filtering. The extended message ID filter element is described in Section 61.4.22.

Figure 709. Extended message ID filter path

MS47285V2

Controlled by the global filter configuration FDCAN\_GFC and the extended ID filter configuration FDCAN\_XIDFC message ID, remote transmission request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

The extended ID AND Mask (FDCAN\_XIDAM) is AND-ed with the received identifier before the filter list is executed.

**Rx FIFOs**

Rx FIFO 0 and Rx FIFO 1 can be configured to hold up to 64 elements each. Configuration of the two Rx FIFOs is done via registers FDCAN\_RXF0C and FDCAN\_RXF1C.

Received messages that passed acceptance filtering are transferred to the Rx FIFO as configured by the matching filter element. For a description of the filter mechanisms available for Rx FIFO 0 and Rx FIFO 1, see [Acceptance filter](#). The Rx buffer and FIFO element is described in [Section 61.4.18](#).

When an Rx FIFO full condition is signaled by FDCAN\_IR.RFnF, no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO get index has been incremented. In case a message is received while the corresponding Rx FIFO is full, this message is discarded and interrupt flag FDCAN\_IR.RFnL is set.

To avoid an Rx FIFO overflow, the Rx FIFO watermark can be used. When the Rx FIFO fill level reaches the Rx FIFO watermark configured by FDCAN\_RXFnC.FnWM, interrupt flag FDCAN\_IR.RFnW is set.

When reading from an Rx FIFO, Rx FIFO get index RXFnS[FnGI] + FIFO element size must be added to the corresponding Rx FIFO start address RXFnC[FnSA].

### Rx FIFO blocking mode

The Rx FIFO blocking mode is configured by RXFnC.FnOM = 0. This is the default operation mode for the Rx FIFOs.

When an Rx FIFO full condition is reached (RXFnS.FnPI = RXFnS.FnGI), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO get index has been incremented. An Rx FIFO full condition is signaled by RXFnS.FnF = 1. In addition interrupt flag FDCAN\_IR.RFnF is set.

In case a message is received while the corresponding Rx FIFO is full, this message is discarded and the message lost condition is signaled by RXFnS.RFnL = 1. In addition interrupt flag FDCAN\_IR.RFnL is set.

### Rx FIFO overwrite mode

The Rx FIFO overwrite mode is configured by RXFnC.FnOM = 1.

When an Rx FIFO full condition (RXFnS.FnPI = RXFnS.FnGI) is signaled by RXFnS.FnF = 1, the next message accepted for the FIFO overwrites the oldest FIFO message. Put and get index are both incremented by one.

When an Rx FIFO is operated in overwrite mode and an Rx FIFO full condition is signaled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is that it can happen that a received message is written to the message RAM (put index) while the CPU is reading from the message RAM (get index). In this case inconsistent data may be read from the respective Rx FIFO element. Adding an offset to the get index when reading from the Rx FIFO avoids this problem. The offset depends on how fast the CPU accesses the Rx FIFO. [Figure 711](#) shows an offset of two with respect to the get index when reading the Rx FIFO. In this case the two messages stored in elements 1 and 2 are lost.

After reading from the Rx FIFO, the number of the last element read must be written to the Rx FIFO acknowledge index RXFnA.FnA. This increments the get index to that element number. In case the put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (RXFnS.FnF = 0).

### Dedicated Rx buffers

The FDCAN supports up to 64 dedicated Rx buffers. The start address of the dedicated Rx buffer section is configured via FDCAN\_RXBC.RBSA.

For each Rx buffer a standard or extended message ID filter element with SFEC / EFEC=111 and SFID2 / EFID2[10:9] = 00 must be configured (see [Section 61.4.21](#) and [Section 61.4.22](#)).

After a received message has been accepted by a filter element, the message is stored into the Rx buffer in the message RAM referenced by the filter element. The format is the same as for an Rx FIFO element. In addition the flag FDCAN\_IR.DRX (message stored in dedicated Rx buffer) in the interrupt register is set.

**Table 472. Example of filter configuration for Rx buffers**

Filter element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID message 1	00	00 0000
1	ID message 2	00	00 0001
2	ID message 3	00	00 0010

After the last word of a matching received message has been written to the message RAM, the respective New data flag in register NDAT1,2 is set. As long as the New data flag is set, the respective Rx buffer is locked against updates from received matching frames. The New data flags have to be reset by the user by writing a 1 to the respective bit position.

While an Rx buffer New data flag is set, a message ID filter element referencing this specific Rx buffer is not matched, causing the acceptance filtering to continue. The following message ID filter elements may cause the received message to be stored into another Rx buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

**Rx buffer handling**

- Reset interrupt flag FDCAN\_IR.DRX
- Read New data registers
- Read messages from message RAM
- Reset New data flags of processed messages

**Filtering for Debug messages**

Filtering for debug messages is done by configuring one standard/extended message ID filter element for each of the three debug messages. To enable a filter element to filter for debug messages SFEC/EFEC must be programmed to 111. In this case fields SFID1 / SFID2 and EFID1 / EFID2 have a different meaning. While SFID2 / EFID2[10:9] controls the debug message handling state machine, SFID2 / EFID2[5:0] controls the location for storage of a received debug message.

When a debug message is stored, neither the respective New data flag nor FDCAN\_IR.DRX are set. The reception of debug messages can be monitored via FDCAN\_RXF1S.DMS.

Table 473. Example of filter configuration for Debug messages

Filter element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID debug message A	01	11 1101
1	ID debug message B	10	11 1110
2	ID debug message C	11	11 1111

### Tx handling

The Tx handler handles transmission requests for the dedicated Tx buffers, the Tx FIFO, and the Tx queue. It controls the transfer of transmit messages to the CAN core, the put and get indices, and the Tx event FIFO. Up to 32 Tx buffers can be set up for message transmission (see [Dedicated Tx buffers](#)). Depending on the configuration of the element size (FDCAN\_RXESC), between two and sixteen 32-bit words ( $R_n = 3 \dots 17$ ) are used for storage of a CAN message data field.

Table 474. Possible configurations for frame transmission

FDCAN_CCCR		Tx buffer element		Frame transmission
BRSE	FDOE	FDL	BRS	
Ignored	0	Ignored	Ignored	Classic CAN
0	1	0	Ignored	Classic CAN
0	1	1	Ignored	FD without bitrate switching
1	1	0	Ignored	Classic CAN
1	1	1	0	FD without bitrate switching
1	1	1	1	FD with bitrate switching

*Note:* AUTOSAR requires at least three Tx queue buffers and support of transmit cancellation.

The Tx handler starts a Tx scan to check for the highest priority pending Tx request (Tx buffer with lowest message ID) when the Tx buffer request pending register FDCAN\_TXBRP is updated, or when a transmission has been started.

### Transmit pause

This feature is intended for use in CAN systems where the CAN message identifiers are (permanently) specified to specific values and cannot easily be changed. These message identifiers may have a higher CAN arbitration priority than other defined messages, while in a specific application their relative arbitration priority should be inverse. This may lead to a case where one ECU sends a burst of CAN messages that cause another ECU CAN messages to be delayed because that other messages have a lower CAN arbitration priority.

If, as an example, CAN ECU-1 has the feature enabled and is requested by its application software to transmit four messages, after the first successful message transmission, it waits for two CAN bit times of bus idle before it is allowed to start the next requested message. If there are other ECUs with pending messages, those messages are started in the idle time, they would not need to arbitrate with the next message of ECU-1. After having received a

message, ECU-1 is allowed to start its next transmission as soon as the received message releases the CAN bus.

The feature is controlled by TXP bit in FDCAN\_CCCR register. If the bit is set, the FDCAN, each time it has successfully transmitted a message, pauses for two CAN bit times before starting the next transmission. This enables other CAN nodes in the network to transmit messages even if their messages have lower prior identifiers. Default is disabled (FDCAN\_CCCR.TXP = 0).

This feature looses up burst transmissions coming from a single node and it protects against "babbling idiot" scenarios where the application program erroneously requests too many transmissions.

### Dedicated Tx buffers

Dedicated Tx buffers are intended for message transmission under complete control of the CPU. Each dedicated Tx buffer is configured with a specific message ID. In case that multiple Tx buffers are configured with the same message ID, the Tx buffer with the lowest buffer number is transmitted first.

If the data section has been updated, a transmission is requested by an add request via FDCAN\_TXBAR.ARn. The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx queue and externally with messages on the CAN bus, and are sent out according to their message ID.

A dedicated Tx buffer allocates four 32-bit words in the message RAM. Therefore the start address of a dedicated Tx buffer in the message RAM is calculated by adding four times the transmit buffer index (0 ... 31) to the Tx buffer start address FDCAN\_TXBC.TBSA.

**Table 475. Tx buffer/FIFO - queue element size**

FDCAN_TXESC.TBDS[2;0]	Data field (bytes)	Element size (RAM words)
000	8	4
001	12	5
010	16	6
011	20	7
100	24	8
101	32	10
110	48	14
111	64	18

### Tx FIFO

Tx FIFO operation is configured by programming FDCAN\_TXBC.TFQM to 0. Messages stored in the Tx FIFO are transmitted starting with the message referenced by the get index FDCAN\_TXFQS.TFGI. After each transmission the get index is incremented cyclically until the Tx FIFO is empty. The Tx FIFO enables transmission of messages with the same message ID from different Tx buffers in the order these messages have been written to the Tx FIFO. The FDCAN calculates the Tx FIFO free level FDCAN\_TXFQS.TFFL as difference between get and put index. It indicates the number of available (free) Tx FIFO elements.

New transmit messages have to be written to the Tx FIFO starting with the Tx buffer referenced by the put index `FDCAN_TXFQS.TFQPI`. An add request increments the put index to the next free Tx FIFO element. When the put index reaches the get index, Tx FIFO full (`FDCAN_TXFQS.TFQF = 1`) is signaled. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the get index has been incremented.

When a single message is added to the Tx FIFO, the transmission is requested by writing a 1 to the `FDCAN_TXBAR` bit related to the Tx buffer referenced by the Tx FIFO put index.

When multiple (n) messages are added to the Tx FIFO, they are written to n consecutive Tx buffers starting with the put index. The transmissions are then requested via `FDCAN_TXBAR`. The put index is then cyclically incremented by n. The number of requested Tx buffers should not exceed the number of free Tx buffers as indicated by the Tx FIFO free level.

When a transmission request for the Tx buffer referenced by the get index is canceled, the get index is incremented to the next Tx buffer with pending transmission request and the Tx FIFO free level is recalculated. When transmission cancellation is applied to any other Tx buffer, the get index and the FIFO free level remain unchanged.

A Tx FIFO element allocates four 32-bit words in the message RAM. Therefore the start address of the next available (free) Tx FIFO buffer is calculated by adding four times the put index `FDCAN_TXFQS.TFQPI` (0 ... 31) to the Tx buffer start address `FDCAN_TXBC.TBSA`.

### **Tx queue**

Tx queue operation is configured by programming `FDCAN_TXBC.TFQM` to 1. Messages stored in the Tx queue are transmitted starting with the message with the lowest message ID (highest priority). In case that multiple queue buffers are configured with the same message ID, the queue buffer with the lowest buffer number is transmitted first.

New messages have to be written to the Tx buffer referenced by the put index `FDCAN_TXFQS.TFQPI`. An add request cyclically increments the put index to the next free Tx buffer. In case that the Tx queue is full (`FDCAN_TXFQS.TFQF = 1`), the put index is not valid and no further message should be written to the Tx queue until at least one of the requested messages has been sent out or a pending transmission request has been canceled.

The application may use register `FDCAN_TXBRP` instead of the put index and may place messages to any Tx buffer without pending transmission request.

A Tx queue buffer allocates four 32-bit words in the message RAM. Therefore the start address of the next available (free) Tx queue buffer is calculated by adding four times the Tx queue put index `FDCAN_TXFQS.TFQPI` (0 ... 31) to the Tx buffer start address `FDCAN_TXBC.TBSA`.

### **Mixed dedicated Tx buffers / Tx FIFO**

In this case the Tx buffers section in the message RAM is subdivided into a set of dedicated Tx buffers and a Tx FIFO. The number of dedicated Tx buffers is configured by `FDCAN_TXBC.NDTB`. The number of Tx buffers assigned to the Tx FIFO is configured by `FDCAN_TXBC.TFQS`. In case, `FDCAN_TXBC.TFQS` is programmed to 0, only dedicated Tx buffers are used.

Figure 710. Example of mixed configuration dedicated Tx buffers / Tx FIFO

Tx prioritization:

- Scan dedicated Tx buffers and oldest pending Tx FIFO buffer (referenced by FDCAN\_TXFS.TFGI)
- Buffer with lowest message ID gets highest priority and is transmitted next

**Mixed dedicated Tx buffers / Tx queue**

In this case the Tx buffers section in the message RAM is subdivided into a set of dedicated Tx buffers and a Tx queue. The number of dedicated Tx buffers is configured by FDCAN\_TXBC.NDTB. The number of Tx queue buffers is configured by FDCAN\_TXBC.TFQS. If FDCAN\_TXBC.TFQS is programmed to 0, only dedicated Tx buffers are used.

Figure 711. Example of mixed configuration dedicated Tx buffers / Tx queue

Tx priority setting:

- Scan all Tx buffers with activated transmission request
- Tx buffer with lowest message ID gets highest priority and is transmitted next

### Transmit cancellation

The FDCAN supports transmit cancellation. To cancel a requested transmission from a dedicated Tx buffer or a Tx queue buffer the user has to write a 1 to the corresponding bit position (= number of Tx buffer) of register FDCAN\_TXBCR. Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signaled by setting the corresponding bit of register FDCAN\_TXBCF to 1.

In case a transmit cancellation is requested while a transmission from a Tx buffer is already ongoing, the corresponding FDCAN\_TXBRP bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding FDCAN\_TXBTO and FDCAN\_TXBCF bits are set. If the transmission was not successful, it is not repeated and only the corresponding FDCAN\_TXBCF bit is set.

*Note: If a pending transmission is canceled immediately before this transmission starts, a short time window follows where no transmission is started even if another message is pending in this node. This may enable another node to transmit a message that may have a priority lower than that of the second message in this node.*

### Tx event handling

To support Tx event handling the FDCAN has implemented a Tx event FIFO. After the FDCAN has transmitted a message on the CAN bus, message ID and timestamp are stored in a Tx event FIFO element. To link a Tx event to a Tx event FIFO element, the message marker from the transmitted Tx buffer is copied into the Tx event FIFO element.

The Tx event FIFO can be configured to a maximum of 32 elements. The Tx event FIFO element is described in [Tx FIFO](#). Depending on the configuration of the element size (FDCAN\_TXESC), between two and sixteen 32-bit words ( $T_n = 3 \dots 17$ ) are used for storage of a CAN message data field.

The purpose of the Tx event FIFO is to decouple handling transmit status information from transmit message handling i.e. a Tx buffer holds only the message to be transmitted, while the transmit status is stored separately in the Tx event FIFO. This has the advantage, especially when operating a dynamically managed transmit queue, that a Tx buffer can be used for a new message immediately after successful transmission. There is no need to save transmit status information from a Tx buffer before overwriting that Tx buffer.

When a Tx event FIFO full condition is signaled by FDCAN\_IR.TEFF, no further elements are written to the Tx event FIFO until at least one element has been read out and the Tx event FIFO get index has been incremented. In case a Tx event occurs while the Tx event FIFO is full, this event is discarded and interrupt flag FDCAN\_IR.TEFL is set.

To avoid a Tx event FIFO overflow, the Tx event FIFO watermark can be used. When the Tx event FIFO fill level reaches the Tx event FIFO watermark configured by FDCAN\_TXEFC.EFWM, interrupt flag FDCAN\_IR.TEFW is set.

When reading from the Tx event FIFO, two times the Tx event FIFO get index FDCAN\_TXEFS.EFGI must be added to the Tx event FIFO start address FDCAN\_TXEFC.EFSA.

### 61.4.3 FIFO acknowledge handling

The get indices of Rx FIFO 0, Rx FIFO 1, and the Tx event FIFO are controlled by writing to the corresponding FIFO acknowledge index, see [FDCAN Rx FIFO 0 acknowledge register](#)

([FDCAN\\_RXF0A](#)), [FDCAN Rx FIFO 1 acknowledge register \(FDCAN\\_RXF1A\)](#), and [FDCAN Tx event FIFO configuration register \(FDCAN\\_TXEFC\)](#). Writing to the FIFO acknowledge index sets the FIFO get index to the FIFO acknowledge index plus one and thereby updates the FIFO fill level. There are two use cases:

- When only a single element has been read from the FIFO (the one being pointed to by the get index), this get index value is written to the FIFO acknowledge index.
- When a sequence of elements has been read from the FIFO, it is sufficient to write the FIFO acknowledge index only once at the end of that read sequence (value: index of the last element read), to update the FIFO get index.

Due to the fact that the CPU has free access to the FDCAN message RAM, special care must be taken when reading FIFO elements in an arbitrary order (get index not considered). This might be useful when reading a high priority message from one of the two Rx FIFOs. In this case the FIFO acknowledge index should not be written because this would set the get index to a wrong position and also alters the FIFO fill level. In this case some of the older FIFO elements would be lost.

*Note:* The application has to ensure that a valid value is written to the FIFO acknowledge index. The FDCAN does not check for erroneous values.

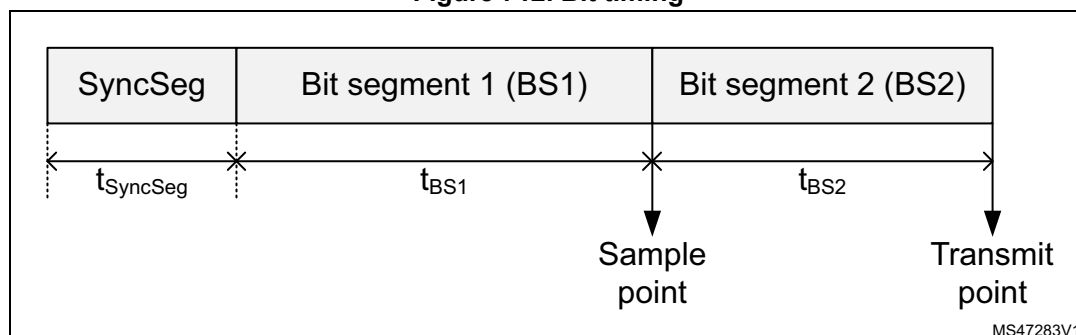

#### 61.4.4 Bit timing

The bit timing logic monitors the serial bus-line and performs sampling and adjustment of the sample point by synchronizing on the start-bit edge and resynchronizing on the following edges.

As shown in [Figure 712](#), its operation may be explained simply by splitting the bit time in three segments, as follows:

- Synchronization segment (SYNC\_SEG): a bit change is expected to occur within this time segment, that has a fixed length of one time quantum ( $1 \times tq$ ).
- Bit segment 1 (BS1): defines the location of the sample point. It includes the PROP\_SEG and PHASE\_SEG1 of the CAN standard, its duration is programmable between 1 and 16 time quanta, but may be automatically lengthened to compensate for positive phase drifts due to differences in the frequency of the various nodes of the network.
- Bit segment 2 (BS2): defines the location of the transmit point. It represents the PHASE\_SEG2 of the CAN standard, its duration is programmable between one and eight time quanta, but may also be automatically shortened to compensate for negative phase drifts.

Figure 712. Bit timing

The baudrate is the inverse of bit time (baudrate = 1 / bit time), which, in turn, is the sum of three components. [Figure 712](#) indicates that bit time =  $t_{\text{SyncSeg}} + t_{\text{BS1}} + t_{\text{BS2}}$ , where:

- for the nominal bit time
  - $t_q = (\text{FDCAN\_NBTP.NBRP}[8:0] + 1) * t_{\text{fdcan\_tq\_ck}}$
  - $t_{\text{SyncSeg}} = 1 t_q$
  - $t_{\text{BS1}} = t_q * (\text{FDCAN\_NBTP.NTSEG1}[7:0] + 1)$
  - $t_{\text{BS2}} = t_q * (\text{FDCAN\_NBTP.NTSEG2}[6:0] + 1)$
- for the data bit time
  - $t_q = (\text{FDCAN\_DBTP.DBRP}[4:0] + 1) * t_{\text{fdcan\_tq\_ck}}$
  - $t_{\text{SyncSeg}} = 1 t_q$
  - $t_{\text{BS1}} = t_q * (\text{FDCAN\_DBTP.DTSEG1}[4:0] + 1)$
  - $t_{\text{BS2}} = t_q * (\text{FDCAN\_DBTP.DTSEG2}[3:0] + 1)$

The (re)synchronization jump width (SJW) defines an upper bound for the amount of lengthening or shortening of the bit segments. It is programmable between one and four time quanta.

A valid edge is defined as the first transition in a bit time from dominant to recessive bus level, provided the controller itself does not send a recessive bit.

If a valid edge is detected in BS1 instead of SYNC\_SEG, BS1 is extended by up to SJW so that the sample point is delayed.

Conversely, if a valid edge is detected in BS2 instead of SYNC\_SEG, BS2 is shortened by up to SJW so that the transmit point is moved earlier.

As a safeguard against programming errors, the configuration of the bit timing register is only possible while the device is in Standby mode. Registers FDCAN\_DBTP and FDCAN\_NBTP (dedicated, respectively, to data and nominal bit timing) are only accessible when FDCAN\_CCCR.CCE and FDCAN\_CCCR.INIT are set.

*Note:* For a detailed description of the CAN bit timing and resynchronization mechanism, refer to the ISO 11898-1 standard.

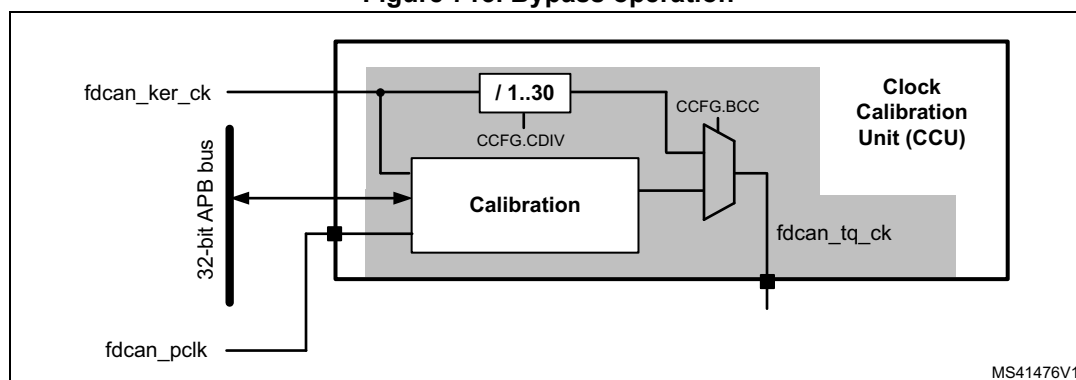

#### 61.4.5 Clock calibration on CAN

After device reset the clock calibration unit (CCU) does not provide a valid clock signal to the FDCAN(s). The CCU must be initialized via FDCAN\_CCFG register. The FDCAN\_CCFG register can be written only when FDCAN1 has both FDCAN\_CCCR.CCE and FDCAN\_CCCR.INIT bits set. In consequence the CCU and the FDCAN1 initialization needs to be completed before any FDCAN module can operate.

Clock calibration is bypassed when FDCAN\_CCFG.BCC = 1 (see [Figure 713](#)).

Figure 713. Bypass operation

### Operating conditions

The clock calibration on CAN unit is designed to operate under the following conditions:

- a CAN kernel clock frequency `fdcan_ker_ck` up of at least 80 MHz
- FDCAN bitrates:
  - Nominal bitrate: up to 1 Mbit/s
  - Data bitrate: between nominal bitrate and 8 Mbit/s

The clock calibration on FDCAN unit generates a calibrated time quanta clock `fdcan_tq_ck` in the range from 0.5 to 25 MHz.

*Note:* The FDCAN requires that the CAN time quanta clock is always below or equal to the APB clock ( $fdcan\_tq\_ck < fdcan\_pclk$ ). This must be considered when the clock calibration on CAN unit is bypassed ( $FDCAN\_CCFG.BCC = 1$ ).

### Calibration accuracy

The calibration accuracy in state `Precision_Calibrated` depends upon the factors listed below.

- Dynamic clock tolerance at the CAN kernel clock input `fdcan_ker_ck`
- Measurement error. For each bit sequence used for calibration measurement, there is a maximum error of one `fdcan_pclk` period. The number of bits used for measurement of the bit time is 32 or 64-bit, depending on configuration of `FDCAN_CCFG.CFL`.
- Tolerable error in calibration mechanism

The distance between two calibration messages must be chosen to fit the clock tolerance requirements of the FDCAN1 module.

*Note:* Dynamic clock tolerance is the clock frequency variation between two calibration messages for example caused by change of temperature or operating voltage.

### Functional description

Calibration of the time quanta clock `fdcan_tq_ck` via CAN messages is performed by adapting a clock divider that generates the CAN protocol time quantum `tq` from the clock `fdcan_ker_ck`.

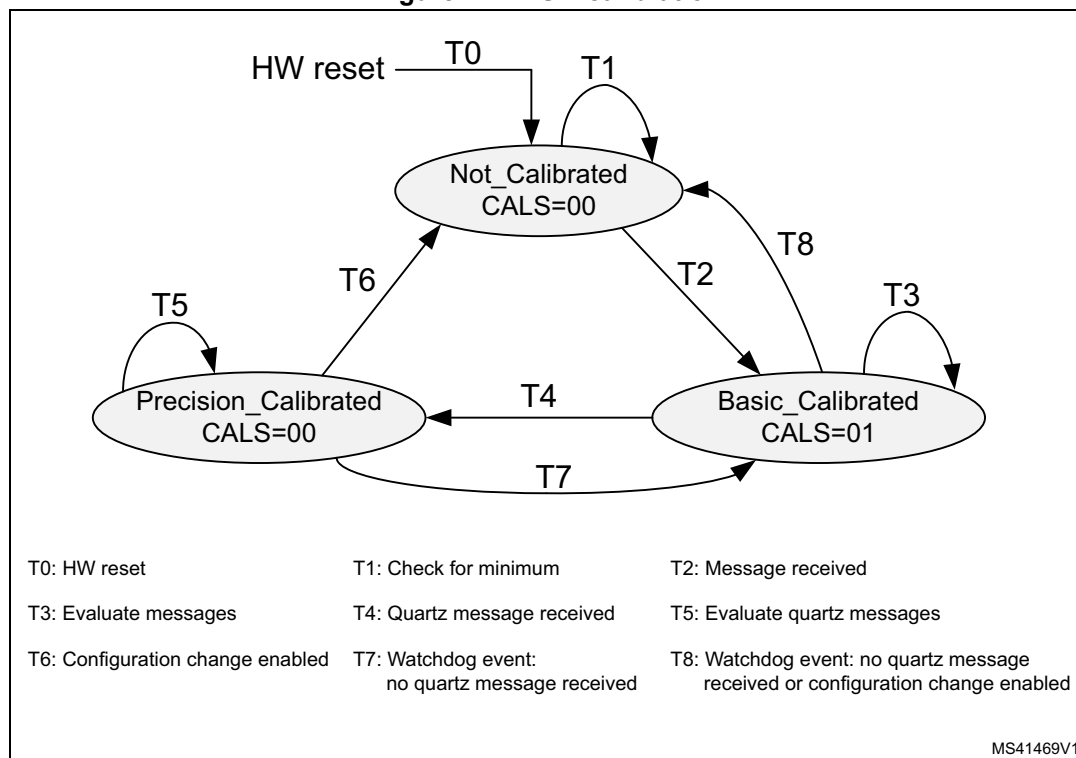

1. First step: basic calibration
 

The minimum distance between two consecutive falling edges from recessive to dominant is measured, this time to be assumed two CAN bit times, counted in PLL clock periods. The clock divider (`FDCAN_CCFG.CDIV`) is updated each time a new

measurement finds a smaller distance between edges. Basic calibration is achieved when the CAN protocol controller detects a valid CAN message.

2. Second step: Precision calibration  
 The calibration state machine measures the length of a longer bit sequence inside a CAN frame by counting the number of `fdcan_ker_ck` periods. The length of this bit sequence can be configured to 32 or 64 bits via `FDCAN_CCFG.CLF`. For a calibration field length of 32/64 bit a calibration message with at least 2/6-byte data field is required. Precision calibration is based on the new clock divider value calculated from the measurement of the longer bit sequence.

Figure 714. FSM calibration

A change in the calibration state sets interrupt flag `FDCAN_CCU_IR.CSC`, if enabled by the interrupt enable `FDCAN_CCU_IE.CSCE`. it remains set until cleared by writing 1 in `FDCAN_CCU_IR.CSC`.

Until precision calibration is achieved, FDCANs operate in a restricted mode (no frame transmission, no error or overload flag transmission, no error counting). In case calibration of the `fdcan_ker_clk` is done by software by evaluating the calibration status from register `FDCAN_CCU_CSTAT`, FDCANs have to be set to restricted operation mode (`FDCAN_CCCR.ASM = 1`) until the calibration on CAN unit is in state `Precision_Calibrated` (see [Application](#)).

Precision calibration may be performed only on valid CAN frames transmitted by a node with a stable, quartz-controlled clock. calibration frames are detected by the FDCAN1 acceptance filtering A filter element and a Rx buffer have to be configured in the FDCAN1 to identify and store calibration messages. After reception of a calibration message the Rx buffer new data flag must be reset to enable signaling of the next calibration message.

In case there is only one CAN transmitter with a quartz clock in the network, this node has to transmit its first message after startup with at least one 1010 binary sequence in the data field or in the identifier. This assures that the non-quartz nodes can enter state `Basic_Calibrated` and then acknowledge the quartz node messages.

Precision calibration must be repeated in predefined maximum intervals supervised by the calibration watchdog.

*Note: When the clock calibration on CAN unit transits from state `Precision_Calibrated` back to `Basic_Calibrated`, the calibration OK signal is deasserted, the FDCAN1 complete ongoing transmissions, and then enter restricted operation (no frame transmission, no error or overload flag transmission, no error counting).*

### Configuration

The clock calibration on CAN unit is configured via register `FDCAN_CCFG`, i.e. when `FDCAN1` has `FDCAN_CCCR.CCE` and `FDCAN_CCCR.INIT` bits set.

For basic calibration the minimum number of oscillator periods between two consecutive falling edges at pin `FDCAN1_RX` is measured. The number of clock periods depends on the clock frequency applied at input `fdcan_ker_ck`. In case the measured number of clock periods is below the minimum configured by `FDCAN_CCFG.OCPM` (as an example, because of a glitch on `FDCAN1_RX`) the value is discarded and measurement continues.

It is recommended to configure `FDCAN_CCFG.OCPM` slightly below two CAN bit times:

$$\text{FDCAN\_CCFG.OCPM} < ((2 \times \text{CAN bit time}) / \text{fdcan\_ker\_ck period}) / 32$$

The length of the bit field used for precision calibration can be configured to 32 or 64 bits via `FDCAN_CCFG.CFL`. The number of bits used for precision calibration has an impact on calibration accuracy and the maximum distance between two calibration messages.

The number of time quanta per bit time configured by `FDCAN_CCFG.TQBT` is used together with the measured number of oscillator clock periods `FDCAN_CCU_CSTAT.OCPC` to define the number of oscillator clocks per bit time.

When the clock calibration is bypassed by configuring `FDCAN_CCFG.BCC = 1`, the internal clock divider must be configured via `FDCAN_CCFG.CDIV` to fulfill the condition `fdcan_tq_ck < fdcan_pclk`.

*Note: When clock calibration on CAN is active (`FDCAN_CCFG.BCC = 0`), the baudrate prescalers of FDCAN modules have to be configured to inactive.*

### Status signaling

The status of the clock calibration on CAN unit can be monitored by reading register `FDCAN_CCU_CSTAT`. When in state `Precision_Calibrated` the oscillator clock period counter `FDCAN_CCU_CSTAT.OCPC` signals the number of oscillator clock periods in the calibration field while `FDCAN_CCU_CSTAT.TQC` signals the number of time quanta in the calibration field.

The calibration state is monitored by `FDCAN_CCU_CSTAT.CALS`. A change in the calibration state sets interrupt flag `FDCAN_CCU_IR.CSC`, if enabled by the interrupt enable `FDCAN_CCU_IE.CSCE` it remains set until cleared by writing 1 in `FDCAN_CCU_IR.CSC`.

A calibration watchdog event also sets interrupt flag `FDCAN_CCU_IR.CWE`, if enabled by `FDCAN_CCU_IE.CWEE` (set to high) it remains active until reset by `FDCAN_CCU_IE.CWE`.

## 61.4.6 Application

### Clock calibration bypassed

The CCU internal clock divider is configured for division by one (FDCAN\_CCFG.CDIV = 0x0000). In this operation mode the input clock `fdcan_ker_ck` is directly routed to the clock output `fdcan_tq_ck`. In this case `fdcan_tq_ck` is independent from the configuration and status of FDCAN1 and FDCAN2 connected to the CCU. CAN FD operation is possible with a `fdcan_ker_ck` above 80 MHz.

### Software calibration

The clock calibration on CAN unit also supports software calibration of `fdcan_ker_ck` by trimming of an on-chip oscillator. For calculation of the trimming values the user has to read the CCU state from FDCAN\_CCU\_CSTAT. The clock from `fdcan_ker_ck` is routed to output `fdcan_tq_ck` (FDCAN\_CCFG.BCC = 1).

The input clock `fdcan_ker_ck` must be at least 80 MHz. The clock divider of CCU must be configured via FDCAN\_CCFG.CDIV to bring `fdcan_tq_ck` to a valid range. All other configuration parameters have to be set via FDCAN\_CCFG. For correct operation of FDCAN1 and FDCAN2, the APB clock `fdcan_pclk` needs to be equal to or higher than the time quanta clock (`fdcan_tq_ck`). CAN FD operation is not possible.

For startup FDCAN modules have to be both configured for restricted operation (FDCAN\_CCCR.ASM = 1) before FDCAN\_CCCR.INIT is reset. The input clock `fdcan_ker_ck` must be adjusted until the clock calibration on CAN unit has reached state `Precision_Calibrated`. Now the software can reset FDCAN\_CCCR.ASM and the CANFD1 and CANFD2 can start normal operation.

During operation the software has to check regularly whether the clock calibration on CAN unit is still in state `Precision_Calibrated`. In case the clock calibration on CAN unit has left state `Precision_Calibrated` due to drift of `fdcan_ker_ck`, FDCAN modules have to be set into restricted operation mode by programming FDCAN\_CCCR.INIT, FDCAN\_CCCR.CCE, and FDCAN\_CCCR.ASM to 1. After `fdcan_ker_ck` has been adjusted successfully (clock calibration on CAN unit is in state `Precision_Calibrated`), FDCAN modules can resume normal operation.

*Note:* *Trimming accuracy must be to sufficient to meet the CAN clock tolerance requirements for the configured bitrate.*

### Clock calibration active

This operation mode is entered by resetting FDCAN\_CCFG.BCC to 0. In this operation mode the `fdcan_ker_ck` is controlled by the CCU.

The generation of CCU output signal `fdcan_tq_ck` depends upon the state of the FDCAN1. Input clock `fdcan_ker_ck` must be above 80 MHz. Configuration of the CCU and FDCAN1 is required. CAN FD operation is not possible.

If FDCAN1 turns to `Bus_Off` or when its INIT bit is set by the user command (FDCAN\_CCCR.INIT = 1), the CCU enters state `Not_Calibrated`. CANFD1 and CANFD2 enter restricted operation mode.

*Note:* *This is the default operation mode after reset in case the reset value of FDCAN\_CCFG.BCC is configured to 0.*

### 61.4.7 TTCAN operations (FDCAN1 only)

#### Reference message

A reference message is a data frame characterized by a specific CAN identifier. It is received and accepted by all nodes except the time master (sender of the reference message).

For level 1 the data length must be at least one; for level 0, 2 the data length must be at least four; otherwise, the message is not accepted as reference message. The reference message may be extended by other data up to the sum of eight CAN data bytes. All bits of the identifier except the three LSBs characterize the message as a reference message. The last three bits specify the priorities of up to eight potential time masters. Reserved bits are transmitted as logical 0 and are ignored by the receivers. The reference message is configured via register FDCAN\_TTRMC.

The time master transmits the reference message. If the reference message is disturbed by an error, it is retransmitted immediately. In case of a retransmission, the transmitted Master\_Ref\_Mark is updated. The reference message is sent periodically, but is allowed to stop the periodic transmission (Next\_is\_Gap bit) and to initiate transmission event-synchronized at the start of the next basic cycle by the current time master or by one of the other potential time masters.

The node transmitting the reference message is the current time master. The time master is allowed to transmit other messages. If the current time master fails, its function is replicated by the potential time master with the highest priority. Nodes that are neither time master nor potential time master are time-receiving nodes.

#### Level 1

Level 1 operation is configured via FDCAN\_TTOCF.OM = 01 and FDCAN\_TTOCF.GEN. external clock synchronization is not available in level 1. The information related to the reference message is stored in the first data byte as shown in [Table 476](#). Cycle\_Count is optional.

**Table 476. First byte of level 1 reference message**

Bits	0	1	2	3	4	5	6	7
First byte	Next_is_Gap	Reserved	Cycle_Count[5:0]					

#### Level 2

Level 2 operation is configured via FDCAN\_TTOCF.OM = 10 and FDCAN\_TTOCF.GEN. The information related to the reference message is stored in the first four data bytes as shown in [Table 477](#). Cycle\_Count and the lower four bits of FDCAN\_NTU\_Res are optional. The TTCAN does not evaluate NTU\_Res[3:0] from received reference messages, it always transmits these bits as 0.

**Table 477. First four bytes of level 2 reference message**

Bits	0	1	2	3	4	5	6	7
First byte	Next_is_Gap	Reserved	Cycle_Count[5;0]					
Second byte	NTU_Res[6:4]			NTU_Res[3:0]			Disc_Bit	
Third byte	Master_Ref_Mark[7:0]							
Fourth byte	Master_Ref_Mark[15:8]							

**Level 0**

Level 0 operation is configured via FDCAN\_TTOCF.OM = 11. External event-synchronized time-triggered operation is not available in level 0. The information related to the reference message is stored in the first four data bytes as shown in the table below. In level 0 Next\_is\_Gap is always 0. Cycle\_Count and the lower four bits of NTU\_Res are optional. The TTCAN does not evaluate NTU\_Res[3:0] from received reference messages, it always transmits these bits as 0.

**Table 478. First four bytes of level 0 reference message**

Bits	0	1	2	3	4	5	6	7
First byte	Next_is_Gap	Reserved	Cycle_Count[5;0]					
Second byte	NTU_Res[6:4]			NTU_Res[3:0]			Disc_Bit	
Third byte	Master_Ref_Mark[7:0]							
Fourth byte	Master_Ref_Mark[15:8]							

**61.4.8 TTCAN configuration**

**TTCAN timing**

The network time unit (NTU) is the unit in which all times are measured. The NTU is a constant of the whole network and is defined as a priority by the network system designer. In TTCAN level 1 the NTU is the nominal CAN bit time. In TTCAN level 0 and level 2 the NTU is a fraction of the physical second.

The NTU is the time base for the local time. The integer part of the local time (16-bit value) is incremented once each NTU. Cycle time and global time are both derived from local time. The fractional part (3-bit value) of local time, cycle time, and global time is not readable.

In TTCAN level 0 and level 2 the length of the NTU is defined by the time unit Ratio TUR. The TUR is in general a non-integer number, given by  $TUR = FDCAN\_TURNA.NAV / FDCAN\_TURCF.DC$ . The NTU length is given by  $NTU = CAN \text{ clock period} \times TUR$ .

The TUR numerator configuration NC is an 18-bit number, FDCAN\_TURCF[NCL[15:0]] can be programmed in the range 0x0000 to 0xFFFF. FDCAN\_TURCF[NCH[17:16]] is hard wired to 0b01. When 0xnxxx is written to FDCAN\_TURCF[NCL[15:0]], FDCAN\_TURNA.NAV starts with the value  $0x10000 + 0x0nnnn = 0x1nnnn$ . The TUR denominator configuration FDCAN\_TURCF.DC is a 14-bit number. FDCAN\_TURCF.DC may be programmed in the range 0x0001 to 0x3FFF (0x0000 is an illegal value).

In level 1, NC must be equal to or higher than  $4 \times \text{FDCAN\_TURCF.DC}$ . In level 0 and level 2 NC must be equal to or higher than  $8 \times \text{FDCAN\_TURCF.DC}$  to get the 3-bit resolution for the internal fractional part of the NTU.

A hardware reset presets FDCAN\_TURCF.DC to 0x1000 and FDCAN\_TURCF.NCL to 0x10000, resulting in an NTU consisting of sixteen CAN clock periods. Local time and application watchdog are not started before either the FDCAN\_CCCR.INIT is reset, or FDCAN\_TURCF.ELT is set. FDCAN\_TURCF.ELT may not be set before the NTU is configured. Setting FDCAN\_TURCF.ELT to 1 also locks the write access to register FDCAN\_TURCF.

At startup FDCAN\_TURNA.NAV is updated from NC (= FDCAN\_TURCF.NCL + 0x10000) when FDCAN\_TURCF.ELT is set. In TTCAN level 1 there is no drift compensation. FDCAN\_TURNA.NAV does not change during operation, it is always equal to NC.

In TTCAN level 0 and level 2 there are two possibilities for FDCAN\_TURNA.NAV to change. When operating as time slave or backup time master, and when FDCAN\_TTOCF.ECC is set, FDCAN\_TURNA.NAV is updated automatically to the value calculated from the monitored global time speed, as long as the TTCAN is in synchronization state In\_Schedule or In\_Gap. When it loses synchronization, it returns to NC. When operating as the actual time master, and when FDCAN\_TTOCF.EECS is set, the user may update FDCAN\_TURCF.NCL. When the user sets FDCAN\_TTOCN.ECS, FDCAN\_TURNA.NAV is updated from the new value of NC at the next reference message. The status flag FDCAN\_TTOST.WECS as is set when FDCAN\_TTOCN.ECS is set and is cleared when FDCAN\_TURNA.NAV is updated. FDCAN\_TURCF.NCL is write locked while FDCAN\_TTOST.WECS is set.

In TTCAN level 0 and level 2 the clock calibration process adapts FDCAN\_TURNA.NAV in the range of the synchronization deviation limit SDL of  $NC \pm 2(\text{FDCAN\_TTOCF.LDSDL} + 5)$ . FDCAN\_TURCF.NCL should be programmed to the largest applicable numerical value in order to achieve the best accuracy in the calculation of FDCAN\_TURNA.NAV.

The synchronization deviation SD is the difference between NC and FDCAN\_TURNA.NAV ( $SD = |NC - \text{FDCAN\_TURNA.NAV}|$ ). It is limited by the synchronization deviation limit SDL, which is configured by its dual logarithm FDCAN\_TTOCF.LDSDL ( $SDL = 2(\text{FDCAN\_TTOCF.LDSDL} + 5)$ ) and should not exceed the clock tolerance given by the CAN bit timing configuration. SD is calculated at each new basic cycle. When the calculated TURNA[NAV deviates by more than SDL from NC, or if the Disc\_Bit in the reference message is set, the drift compensation is suspended and FDCAN\_TTIR.GTE is set and FDCAN\_TTOSC.QCS is reset, or in case of the Disc\_Bit = 1, FDCAN\_TTIR.GTD is set.

**Table 479. TUR configuration example**

TUR	8	10	24	50	510	125000	32.5	100/12	529/17
NC	0x1FFF8	0x1FFFE	0x1FFF8	0x1FFEA	0x1FFFE	0x1E848	0x1FFE0	0x19000	0x10880
FDCAN_TURCF.DC	0x3FFF	0x3333	0x1555	0x0A3D	0x0101	0x0001	0x0FC0	0x3000	0x0880

FDCAN\_TTOCN.ECS schedules NC for activation by the next reference message. FDCAN\_TTOCN.SGT schedules FDCAN\_TTGTP.TP for activation by the next reference message. Setting FDCAN\_TTOCN.ECS and FDCAN\_TTOCN.SGT requires FDCAN\_TTOCF.EECS to be set (external clock synchronization enabled) while the FDCAN is actual time master.

The TTCAN module provides an application watchdog to verify the function of the application program. The user has to serve this watchdog regularly, else all CAN bus activity is stopped. The application watchdog limit FDCAN\_TTOCF.AWL specifies the number of NTUs between two times the watchdog must be served. The maximum number of NTUs is 256. The application watchdog is served by reading register FDCAN\_TTOST. FDCAN\_TTOST.AWE indicates whether the watchdog has been served in time. In case the application failed to serve the application watchdog, interrupt flag FDCAN\_TTIR.AW is set. For software development, the application watchdog may be disabled by programming FDCAN\_TTOCF.AWL to 0x00, see [Section 61.6.3](#).

### Timing of interface signals

The timing events that cause a pulse at output FDCAN trigger time mark interrupt pulse `fdcan1_tmp` for more than one instance and `fdcan_tmp` if only one instance; FDCAN register time mark interrupt pulse `fdcan1_rtp` for more than one instance and `fdcan_rtp` if only one instance are generated in the CAN clock domain.

There is a clock domain crossing delay to be considered before the same event is visible in the APB clock domain (when FDCAN\_TTIR.TTMI is set or FDCAN\_TTIR.RTMI is set). As an example, the signals can be connected to the timing input(s) of another FDCAN node (`fdcan_swt/fdcan_evt`), in order to automatically synchronize two TTCAN networks.

Output FDCAN start of cycle `fdcan1_soc` for more than one instance and `cycle_fdcan1_soc` if only one instance gets active whenever a reference message is completed (either transmitted or received). The output is controlled in the APB clock domain.

## 61.4.9 Message scheduling

FDCAN\_TTOCF.TM controls whether the TTCAN operates as potential time master or as a time slave. If it is a potential time master, the three LSBs of the reference message identifier FDCAN\_TTRMC.RID define the master priority, 0 giving the highest and 7 giving the lowest. There cannot be two nodes in the network using the same master priority. FDCAN\_TTRMC.RID is used for recognition of reference messages. FDCAN\_TTRMC.RMPS is not relevant for time slaves.

The initial reference trigger offset FDCAN\_TTOCF.IRTO is a 7-bit-value that defines (in NTUs) how long a backup time master waits before it starts the transmission of a reference message when a reference message is expected but the bus remains idle. The recommended value for FDCAN\_TTOCF.IRTO is the master priority multiplied with a factor depending on the expected clock drift between the potential time masters in the network. The sequential order of the backup time masters, when one of them starts the reference message in case the current time master fails, should correspond to their master priority, even with maximum clock drift.

FDCAN\_TTOCF.OM decides whether the node operates in TTCAN level 0, level 1, or level 2. In one network, all potential time masters have to operate on the same level. Time slaves may operate on level 1 in a level 2 network, but not vice versa. The configuration of the TTCAN operation mode via FDCAN\_TTOCF.OM is the last step in the setup. With FDCAN\_TTOCF.OM = 00 (event-driven CAN communication), the FDCAN operates

according to ISO 11898-1: 2015, without time triggers. With FDCAN\_TTOCF.OM = 01 (level 1), the FDCAN operates according to ISO 11898-4, but without the possibility to synchronize the basic cycles to external events, the Next\_is\_Gap bit in the reference message is ignored. With FDCAN\_TTOCF.OM = 10 (level 2), the TTCAN operates according to ISO 11898-4, including the event-synchronized start of a basic cycle. With FDCAN\_TTOCF.OM = 11 (level 0), the FDCAN operates as event-driven CAN but maintains a calibrated global time base as in level 2.

FDCAN\_TTOCF.EECS enables the external clock synchronization, allowing the application program of the current time master to update the TUR configuration during time-triggered operation, to adapt the clock speed and (in levels 0 and level 2 only) the global clock phase to an external reference.

FDCAN\_TTMLM.ENTT in the TT matrix limits register specifies the number of expected Tx\_Triggers in the system matrix. This is the sum of Tx\_Triggers for exclusive, single arbitrating and merged arbitrating windows, excluding the Tx\_Ref\_Triggers. Note that this is usually not the number of Tx\_Trigger memory elements; the number of basic cycles in the system matrix and the trigger repeat factors have to be taken into account.

An inaccurate configuration of FDCAN\_TTMLM.ENTT results either in a TxCount Underflow (FDCAN\_TTIR.TXU = 1 and FDCAN\_TTOST.EL = 01, severity 1), or in a Tx count Overflow (FDCAN\_TTIR.TXO = 1 and FDCAN\_TTOST.EL = 10, severity 2).

*Note:* In case the first reference message seen by a node does not have Cycle\_Count 0, this node may finish its first matrix cycle with its Tx count resulting in a Tx count underflow condition. As long as a node is in state Synchronizing, its Tx\_Triggers do not lead to transmissions.

FDCAN\_TTMLM.CCM specifies the number of the last basic cycle in the system matrix. The counting of basic cycles starts at 0. In a system matrix consisting of eight basic cycles FDCAN\_TTMLM.CCM would be 7. FDCAN\_TTMLM.CCM is ignored by time slaves, a receiver of a reference message considers the received cycle count as the valid cycle count for the actual basic cycle.

FDCAN\_TTMLM.TXEW specifies the length of the Tx enable window in NTUs. The Tx enable window is that period of time at the beginning of a time window where a transmission may be started. If a transmission of a message cannot be started inside the Tx enable window because of for example, a slight overlap from the previous time window message, the transmission cannot be started in that time window at all. FDCAN\_TTMLM.TXEW must be chosen with respect to the network synchronization quality and with respect to the relation between the length of the time windows and the length of the messages.

### Trigger memory

The trigger memory is part of the external message RAM to which the TTCAN is connected to (see [Section 61.5.26](#)). It stores up to 64 trigger elements. A trigger memory element consists of time mark TM, cycle code CC, trigger type TYPE, filter type FTYPE, message number MNR, message status count MSC, time mark event internal TMIN, time mark event external TMEX (see [Section 61.4.23](#)).

The time mark defines at which cycle time a trigger becomes active. The triggers in the trigger memory have to be sorted by their time marks. The trigger element with the lowest time mark is written to the first trigger memory word. Message number and cycle code are ignored for triggers of type Tx\_Ref\_Trigger, Tx\_Ref\_Trigger\_Gap, Watch\_Trigger, Watch\_Trigger\_Gap, and End\_of\_List.

When the cycle time reaches the time mark of the actual trigger, the FSE switches to the next trigger and starts to read the following trigger from the trigger memory. In case of a

transmit trigger, the Tx handler starts to read the message from the message RAM as soon as the FSE switches to its trigger. The RAM access speed defines the minimum time step between a transmit trigger and its preceding trigger, the Tx handler must be able to prepare the transmission before the transmit trigger time mark is reached. The RAM access speed also limits the number of non-matching (with regard to their cycle code) triggers between two matching triggers, the next matching trigger must be read before its time mark is reached. If the reference message is  $n$  NTU long, a trigger with a time mark lower than  $n$  never becomes active and is treated as a configuration error.

Starting point of the cycle time is the sample point of the reference message start of frame bit. The next reference message is requested when cycle time reaches the Tx\_Ref\_Trigger time mark. The FDCAN reacts on the transmission request at the next sample point. A new Sync\_Mark is captured at the start of frame bit, but the cycle time is incremented until the reference message is successfully transmitted (or received) and the Sync\_Mark is taken as the new Ref\_Mark. At that point in time, cycle time is restarted. As a consequence, cycle time can never (with the exception of initialization) be seen at a value lower than  $n$ , with  $n$  being the length of the reference message measured in NTU.

Length of a basic cycle: Tx\_Ref\_Trigger time mark + 1 NTU + 1 CAN bit time.

The trigger list is different for all nodes in the CAN FD network. Each node knows only the Tx\_Triggers for its own transmit messages, the Rx\_Triggers for those receive messages that are processed by this node, and the triggers concerning the reference messages.

### Trigger types

Tx\_Ref\_Trigger (TYPE = 0000) and Tx\_Ref\_Trigger\_Gap (TYPE = 0001) cause the transmission of a reference message by a time master. A configuration error (FDCAN\_TTOST.EL = 11, severity 3) is detected when a time slave encounters a Tx\_Ref\_Trigger(\_Gap) in its trigger memory. Tx\_Ref\_Trigger\_Gap is only used in external event-synchronized time-triggered operation mode. In that mode, Tx\_Ref\_Trigger is ignored when the FDCAN synchronization state is In\_Gap (FDCAN\_TTOST.SYS = 10).

Tx\_Trigger\_Single (TYPE = 0010), Tx\_Trigger\_Continuous (TYPE = 0011), Tx\_Trigger\_Arbitration (TYPE = 0100), and Tx\_Trigger\_Merged (TYPE = 0101) cause the start of a transmission. They define the start of a time window.

Tx\_Trigger\_Single starts a single transmission in an exclusive time window when the message buffer transmission request pending bit is set. After successful transmission the transmission request pending bit is reset.

Tx\_Trigger\_Continuous starts a transmission in an exclusive time window when the message buffer transmission request pending bit is set. After successful transmission the transmission request pending bit remains set, and the message buffer is transmitted again in the next matching time window.

Tx\_Trigger\_Arbitration starts an arbitrating time window, Tx\_Trigger\_Merged a merged arbitrating time window. The last Tx\_Trigger of a merged arbitrating time window must be of type Tx\_Trigger\_Arbitration. A configuration error (FDCAN\_TTOST.EL = 11, severity 3) is detected when a trigger of type Tx\_Trigger\_Merged is followed by any other Tx\_Trigger than one of type Tx\_Trigger\_Merged or Tx\_Trigger\_Arbitration. Several Tx\_Triggers may be defined for the same Tx message buffer. Depending on their cycle code, they may be ignored in some basic cycles. The cycle code must be considered when the expected number of Tx\_Triggers (FDCAN\_TTMLM.ENTT) is calculated.

Watch\_Trigger (TYPE = 0110) and Watch\_Trigger\_Gap (TYPE = 0111) check for missing reference messages. They are used by both time masters and time slaves. Watch\_Trigger\_Gap is only used in external event-synchronized time-triggered operation mode. In that mode, a Watch\_Trigger is ignored when the FDCAN synchronization state is In\_Gap (FDCAN\_TTOST.SYS = 10).

Rx\_Trigger (TYPE = 1000) is used to check for the reception of periodic messages in exclusive time windows. Rx\_Triggers are not active until state In\_Schedule or In\_Gap is reached. The time mark of an Rx\_Trigger must be placed after the end of that message transmission, independent of time window boundaries. Depending on their cycle code, Rx\_Triggers may be ignored in some basic cycles. At the time mark of the Rx\_Trigger, it is checked whether the last received message before this time mark and after start of cycle or previous Rx\_Trigger had matched the acceptance filter element referenced by MNR. Accepted messages are stored in one of the two receive FIFOs, according to the acceptance filtering, independent of the Rx\_Trigger. Acceptance filter elements referenced by Rx\_Triggers should be placed at the beginning of the filter list to ensure that the filtering is finished before the Rx\_Trigger time mark is reached.

Time\_Base\_Trigger (TYPE = 1001) are used to generate internal/external events depending on the configuration of TMIN and TMEX.

End\_of\_List (TYPE = 1010 ... 1111) is an illegal trigger type, a configuration error (FDCAN\_TTOST.EL = 11, severity 3) is detected when an End\_of\_List trigger is encountered in the trigger memory before the Watch\_Trigger and Watch\_Trigger\_Gap.

### Restrictions for the node trigger list

There may not be two triggers that are active at the same cycle time and cycle count, but triggers that are active in different basic cycles (different cycle code) may share the same time mark.

Rx\_Triggers and Time\_Base\_Triggers may not be placed inside the Tx enable windows of Tx\_Trigger\_Single/Continuous/Arbitration, but they may be placed after Tx\_Trigger\_Merged.

Triggers that are placed after the Watch\_Trigger (or the Watch\_Trigger\_Gap when FDCAN\_TTOST.SYS = 10) never become active. The watch triggers themselves do not become active when the reference messages are transmitted on time.

All unused trigger memory words (after the Watch\_Trigger or after the Watch\_Trigger\_Gap when FDCAN\_TTOST.SYS = 10) must be set to trigger type End\_of\_List.

A typical trigger list for a potential time master begins with a number of Tx\_Triggers and Rx\_Triggers followed by the Tx\_Ref\_Trigger and the Watch\_Trigger. For networks with external event-synchronized time-triggered communication, this is followed by the Tx\_Ref\_Trigger\_Gap and the Watch\_Trigger\_Gap. The trigger list for a time slave is the same but without the Tx\_Ref\_Trigger and the Tx\_Ref\_Trigger\_Gap.

At the beginning of each basic cycle, that is at each reception or transmission of a reference message, the trigger list is processed starting with the first trigger memory element. The FSE looks for the first trigger with a cycle code that matches the current cycle count. The FSE waits until cycle time reaches the trigger time mark and activates the trigger. Afterwards the FSE looks for the next trigger in the list with a cycle code that matches the current cycle count.

Special consideration is needed for the time around Tx\_Ref\_Trigger and Tx\_Ref\_Trigger\_Gap. In a time master competing for master ship, the effective time mark of

a Tx\_Ref\_Trigger may be decremented in order to be the first node to start a reference message. In backup time masters the effective time mark of a Tx\_Ref\_Trigger or Tx\_Ref\_Trigger\_Gap is the sum of its configured time mark and the reference trigger offset FDCAN\_TTOCF.IRTO. In case error level 2 is reached (FDCAN\_TTOST.EL = 10), the effective time mark is the sum of its time mark and 0x127. No other trigger elements should be placed in this range otherwise it may happen that the time marks appear out of order and are flagged as a configuration error. Trigger elements which are coming after Tx\_Ref\_Trigger may never become active as long as the reference messages come in time.

There are interdependencies between the following parameters:

- APB clock frequency
- Speed and waiting time for trigger RAM accesses
- Length of the acceptance filter list
- Number of trigger elements
- Complexity of cycle code filtering in the trigger elements
- Offset between time marks of the trigger elements

**Example for trigger handling**

The example shows how the trigger list is derived from a node system matrix. Assumption is that node A is first time master and has knowledge of the section of the system matrix shown in [Table 480](#).

**Table 480. System matrix, Node A**

Cycle count	Time mark						
	1	2	3	4	5	6	7
0	Tx7	-	-	-	-	TxRef	Error
1	Rx3	-	Tx2, Tx4		-	TxRef	Error
2	-	-	-	-	-	TxRef	Error
3	Tx7	-	Rx5	-	-	TxRef	Error
4	Tx7	-	-	Rx6	-	TxRef	Error

The cycle count starts with 0 and runs until 0, 1, 3, 7, 15, 31, 63 (the corresponding number of basic cycles in the system matrix is, respectively, 1, 2, 4, 8, 16, 32, 64). The maximum cycle count is configured by FDCAN\_TTMLM.CCM. The cycle code CC is composed of repeat factor (= value of most significant 1) and the number of the first basic cycle in the system matrix (= bit field after most significant 1).

As an example, with a cycle code of 0b0010011 (repeat factor = 16, first basic cycle = 3) and a maximum cycle count of FDCAN\_TTMLM.CCM = 0x3F matches occur at cycle counts 3, 19, 35 and 51.

A trigger element consists of time mark TM, cycle code CC, trigger type TYPE, and message number MNR. For transmission MNR references the Tx buffer number (0 ... 31). For reception MNR references the number of the filter element (0 ... 127) that matched during acceptance filtering. Depending on the configuration of the filter type FTYPE, the 11-bit or 29-bit message ID filter list is referenced.

In addition a trigger element can be configured for generation of time mark event internal TMIN, and time mark event external TMEX. The message status count MSC holds the counter value (0 ... 7) for scheduling errors for periodic messages in exclusive time windows at the point in time when the time mark of the trigger element became active.

**Table 481. Trigger list, Node A**

Trigger	Time mark TM[15:0]	Cycle code CC [6:0]	Trigger type TYPE [3:0]	Mess No. MNR [6:0]
0	Mark1	0b0000100	Tx_Trigger_Single	7
1	Mark 1	0b1000000	Rx_Trigger	3
2	Mark 1	0b1000011	Tx_Trigger_Single	7
3	Mark 3	0b1000001	Tx_Trigger_Merged	2
4	Mark 3	0b1000011	Rx_Trigger	5
5	Mark 4	0b1000001	Tx_Trigger_Arbitration	4
6	Mark 4	0b1000100	Rx_Trigger	6
7	Mark 6	N/A	Tx_Ref_Trigger	0 (Ref)
8	Mark 7	N/A	Watch_Trigger	N/A
9	N/A	N/A	End_of_List	N/A

Tx\_Trigger\_Single, Tx\_Trigger\_Continuous, Tx\_Trigger\_Merged, Tx\_Trigger\_Arbitration, Rx\_Trigger, and Time\_Base\_Trigger are only valid for the specified cycle code. For all other trigger types the cycle code is ignored.

The FSE starts the basic cycle with scanning the trigger list starting from 0 until a trigger with time mark higher than cycle time and with its cycle code CC matching the actual cycle count is reached, or a trigger of type Tx\_Ref\_Trigger, Tx\_Ref\_Trigger\_Gap, Watch\_Trigger, or Watch\_Trigger\_Gap is encountered.

When the cycle time reached the time mark TM, the action defined by trigger type TYPE and message number MNR is started. There is an error in the configuration when End\_of\_List is reached.

At mark 6 the reference message (always TxRef) is transmitted. After transmission of the reference message the FSE returns to the beginning of the trigger list. When the watch trigger at mark 7 is reached, the node was not able to transmit the reference message; error treatment is started.

### Detection of configuration errors

A configuration error is signaled via FDCAN\_TTOST.EL = 11 (severity 3) when:

- The FSE comes to a trigger in the list with a cycle code that matches the current cycle count but with a time mark that is less than the cycle time.
- The previous active trigger was a Tx\_Trigger\_Merged and the FSE comes to a trigger in the list with a cycle code that matches the current cycle count but that is neither a

Tx\_Trigger\_Merged nor a Tx\_Trigger\_Arbitration nor a Time\_Base\_Trigger nor an Rx\_Trigger.

- The FSE of a node with FDCAN\_TTOCF.TM=0 (time slave) encounters a Tx\_Ref\_Trigger or a Tx\_Ref\_Trigger\_Gap.
- Any time mark placed inside the Tx enable window (defined by FDCAN\_TTMLM.TXEW) of a Tx\_Trigger with a matching cycle code.
- A time mark is placed near the time mark of a Tx\_Ref\_Trigger and the reference trigger offset FDCAN\_TTOST.RTO causes a reversal of their sequential order measured in cycle time.

### TTCAN schedule initialization

The synchronization to the TTCAN message schedule starts when FDCAN\_CCCR.INIT is reset. The TTCAN can operate strictly time-triggered (FDCAN\_TTOCF.GEN = 0) or external event-synchronized time-triggered (FDCAN\_TTOCF.GEN = 1). All nodes start with cycle time 0 at the beginning of their trigger list with FDCAN\_TTOST.SYS = 00 (out of synchronization), no transmission is enabled with the exception of the reference message. Nodes in external event-synchronized time-triggered operation mode ignore Tx\_Ref\_Trigger and Watch\_Trigger and use instead Tx\_Ref\_Trigger\_Gap and Watch\_Trigger\_Gap until the first reference message decides whether a Gap is active.

### Time slaves

After configuration, a time slave ignores its Watch\_Trigger and Watch\_Trigger\_Gap if it does not receive any message before reaching the Watch\_Triggers. When it reaches Init\_Watch\_Trigger, interrupt flag FDCAN\_TTIR.IWT is set, the FSE is frozen, and the cycle time becomes invalid, but the node is still able to take part in CAN bus communication (to acknowledge or to send error flags). The first received reference message restarts the FSE and the cycle time.

*Note: Init\_Watch\_Trigger is not part of the trigger list. It is implemented as an internal counter that counts up to 0xFFFF = maximum cycle time.*

When a time slave has received any message but the reference message before reaching the Watch\_Triggers, it assumes a fatal error (FDCAN\_TTOST.EL = 11, severity 3), set interrupt flag FDCAN\_TTIR.WT, switch off its CAN bus output, and enter the bus monitoring mode (FDCAN\_CCCR.MON set to 1). In the bus monitoring mode it is still able to receive messages, but cannot send any dominant bits and therefore cannot give acknowledge.

*Note: To leave the fatal error state, the user has to set FDCAN\_CCCR.INIT = 1. After reset of FDCAN\_CCCR.INIT, the node restarts TTCAN communication.*

When no error is encountered during synchronization, the first reference message sets FDCAN\_TTOST.SYS = 01 (Synchronizing), the second sets the FDCAN synchronization state (depending on its Next\_is\_Gap bit) to FDCAN\_TTOST.SYS = 11 (In\_Schedule) or FDCAN\_TTOST.SYS = 10 (In\_Gap), enabling all Tx\_Triggers and Rx\_Triggers.

### Potential time masters

After configuration, a potential time master starts the transmission of a reference message when it reaches its Tx\_Ref\_Trigger (or its Tx\_Ref\_Trigger\_Gap when in external event-synchronized time-triggered operation). It ignores its Watch\_Trigger and Watch\_Trigger\_Gap when it does not receive any message or transmit the reference message successfully before reaching the Watch\_Triggers (assumed reason: all other nodes still in reset or configuration, giving no acknowledge). When it reaches

Init\_Watch\_Trigger, the attempted transmission is aborted, interrupt flag FDCAN\_TTIR.IWT is set, the FSE is frozen, and the cycle time becomes invalid, but the node is still able to take part in CAN bus communication (to give acknowledge or to send error flags). Resetting FDCAN\_TTIR.IWT re-enables the transmission of reference messages until next time the Init\_Watch\_Trigger condition is met, or another CAN message is received. The FSE is not be restarted by the reception of a reference message.

When a potential time master reaches the Watch\_Triggers after it has received any message but the reference message, it assumes a fatal error (FDCAN\_TTOST.EL = 11, severity 3), sets interrupt flag FDCAN\_TTIR.WT, switches off its CAN bus output, and enters the bus monitoring mode (FDCAN\_CCCR.MON set to 1). In bus monitoring mode, it is still able to receive messages, but cannot send any dominant bits and therefore cannot give acknowledge.

When no error is detected during initialization, the first reference message sets FDCAN\_TTOST.SYS = 01 (synchronizing), the second sets the FDCAN synchronization state (depending on its Next\_is\_Gap bit) to FDCAN\_TTOST.SYS = 11 (In\_Schedule) or FDCAN\_TTOST.SYS = 10 (In\_Gap), enabling all Tx\_Triggers and Rx\_Triggers.

A potential time master is current time master (FDCAN\_TTOST.MS = 11) when it was the transmitter of the last reference message, else it is backup time master (FDCAN\_TTOST.MS = 10).

When all potential time masters have finished configuration, the node with the highest time master priority in the network becomes the current time master.

#### 61.4.10 TTCAN gap control

All functions related to gap control apply only when the FDCAN is operated in external event synchronized time-triggered mode (FDCAN\_TTOCF.GEN = 1). In this operation mode the FDCAN message schedule may be interrupted by inserting gaps between the basic cycles of the system matrix. All nodes connected to the CAN network have to be configured for external event- synchronized time-triggered operation.

During a gap, all transmissions are stopped and the CAN bus remains idle. A gap is finished when the next reference message starts a new basic cycle. A gap starts at the end of a basic cycle that itself was started by a reference message with bit Next\_is\_Gap = 1 for example gaps are initiated by the current time master.

The current time master has two options to initiate a gap. A gap can be initiated under software control when the application program writes FDCAN\_TTOCN.NIG = 1. The Next\_is\_Gap bit is transmitted as 1 with the next reference message. A gap can also be initiated under hardware control when the application program enables the event trigger input pin fdcan\_evt by writing FDCAN\_TTOCN.GCS = 1. When a reference message is started and FDCAN\_TTOCN.GCS is set, a HIGH level at event trigger pin fdcan\_evt sets Next\_is\_Gap = 1.

As soon as that reference message is completed, the FDCAN\_TTOST.WFE bit announces the gap to the time master as well as to the time slaves. The current basic cycle continues until its last time window. The time after the last time window is the gap time.

For the actual time master and the potential time masters, FDCAN\_TTOST.GSI is set when the last basic cycle has finished and the gap time starts. In nodes that are time slaves, bit FDCAN\_TTOST.GSI remains at 0.

When a potential time master is in synchronization state In\_Gap (FDCAN\_TTOST.SYS = 10), it has four options to intentionally finish a gap:

1. Under software control by writing `FDCAN_TTOCN.FGP = 1`.
2. Under hardware control (`FDCAN_TTOCN.GCS = 1`) an edge from HIGH to LOW at the event-trigger input pin `fdcan_evt` sets `FDCAN_TTOCN.FGP` and restarts the schedule.
3. The third option is a time-triggered restart. When `FDCAN_TTOCN.TMG = 1`, the next register time mark interrupt (`FDCAN_TTIR.RTMI = 1`) sets `FDCAN_TTOCN.FGP` and starts the reference message.
4. Finally any potential time master finishes a gap when it reaches its `Tx_Ref_Trigger_Gap`, assuming that the event to synchronize on did not occur in time.

None of these options can cause a basic cycle to be interrupted with a reference message.

Setting of `FDCAN_TTOCN.FGP` after the gap time begins starts the transmission of a reference message immediately and thereby synchronizes the message schedule. When `FDCAN_TTOCN.FGP` is set before the gap time has started (while the basic cycle is still in progress), the next reference message is started at the end of the basic cycle, at the `Tx_Ref_Trigger` – there is no gap time in the message schedule.

In strictly time-triggered operation, bit `Next_is_Gap = 1` in the reference message is ignored, as well as the event-trigger input pin `fdcan_evt` and the bits `FDCAN_TTOCN.NIG`, `FDCAN_TTOCN.FGP`, and `FDCAN_TTOCN.TMG`.

#### 61.4.11 Stop watch

The stop watch function enables capturing of FDCAN internal time values (local time, cycle time, or global time) triggered by an external event.

To enable the stop watch function, the application program first has to define local time, cycle time, or global time as stop watch source via `FDCAN_TTOCN.SWS`. When `FDCAN_TTOCN.SWS` is different from 00 and TT interrupt register flag `FDCAN_TTIR.SWE` is 0, the actual value of the time selected by `FDCAN_TTOCN.SWS` is copied into `FDCAN_TTCPT.SWV` on the next rising / falling edge (as configured via `FDCAN_TTOCN.SWP`) on stop watch trigger pin `fdcan_swt`. This sets interrupt flag `FDCAN_TTIR.SWE`. After the application program has read `FDCAN_TTCPT.SWV`, it may enable the next stop watch event by resetting `FDCAN_TTIR.SWE` to 0.

#### 61.4.12 Local time, cycle time, global time, and external clock synchronization

There are two possible levels in time-triggered CAN:

1. Level 1 only provides time-triggered operation using cycle time.
2. Level 2 additionally provides increased synchronization quality, global time and external clock synchronization. In both levels, all timing features are based on a local time base - the local time.

The local time is a 16-bit cyclic counter, it is incremented once each NTU. Internally the NTU is represented by a 3-bit counter which can be regarded as a fractional part (three binary digits) of the local time. Generally, the 3-bit NTU counter is incremented eight times each NTU. If the length of the NTU is shorter than eight CAN clock periods (as may be configured in level 1, or as a result of clock calibration in level 2), the length of the NTU fraction is adapted, and the NTU counter is incremented only four times each NTU.

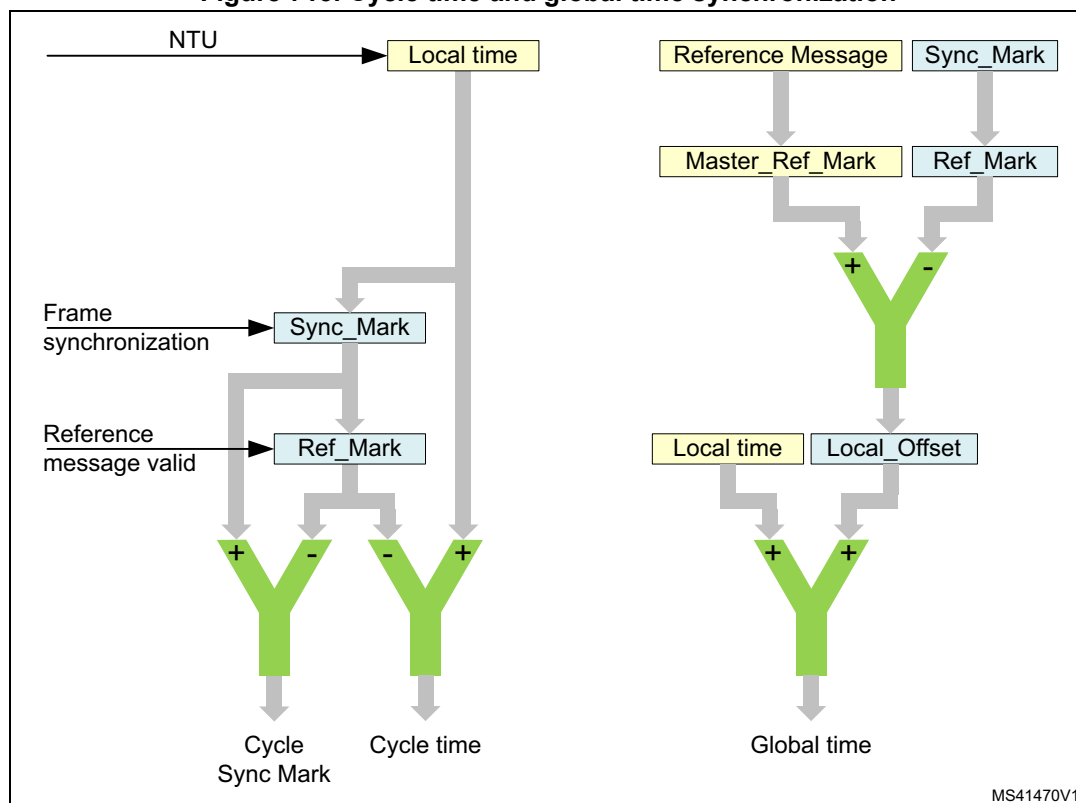

*Figure 715* describes the synchronization of the cycle time and global time, performed in the same manner by all FDCAN nodes, including the time master. Any message received or transmitted invokes a capture of the local time taken at the message is frame

synchronization event. This frame synchronization event occurs at the sample point of each start of frame (SoF) bit and causes the local time to be stored as Sync\_Mark. Sync\_Marks and Ref\_Marks are captured including the 3-bit fractional part.

Whenever a valid reference message is transmitted or received, the internal Ref\_Mark is updated from the Sync\_Mark. The difference between Ref\_Mark and Sync\_Mark is the cycle sync mark (cycle sync mark = Sync\_Mark - Ref\_Mark) stored in register FDCAN\_TTCSM. The most significant 16 bits of the difference between Ref\_Mark and the actual value of the local time is the cycle time (cycle time = local time - Ref\_Mark).

Figure 715. Cycle time and global time synchronization

The cycle time that can be read from FDCAN\_TTCTC.CT is the difference of the node local time and Ref\_Mark, both synchronized into the APB clock domain and truncated to 16 bit.

The global time exists for TTCAN level 0 and level 2 only, in level 1 it is invalid. The node view of the global time is the local image of the global time in (local) NTUs. After configuration, a potential time master uses its own local time as global time. The time master establishes its own local time as global time by transmitting its own Ref\_Marks as Master\_Ref\_Marks in the reference message (bytes 3 and 4). The global time that can be read from FDCAN\_TTLGT.GT is the sum of the node local time and its local offset, both synchronized into the APB clock domain and truncated to 16 bit. The fractional part is used for clock synchronization only.

A node that receives a reference message calculates its local offset to the global time by comparing its local Ref\_Mark with the received Master\_Ref\_Mark (see Figure 716). The node view of the global time is local time plus local offset. In a potential time master that has never received another time master reference message, Local\_Offset is 0. When a node becomes the current time master after first having received other reference messages,

Local\_Offset is frozen at its last value. In the time receiving nodes, Local\_Offset may be subject to small adjustments, due to clock drift, when another node becomes time master, or when there is a global time discontinuity, signaled by Disc\_Bit in the reference message. With the exception of global time discontinuity, the global time provided to the application program by register FDCAN\_TTLGT is smoothed by a low-pass filtering to have a continuous monotonic value.

Figure 716. TTCAN level 0 and level 2 drift compensation

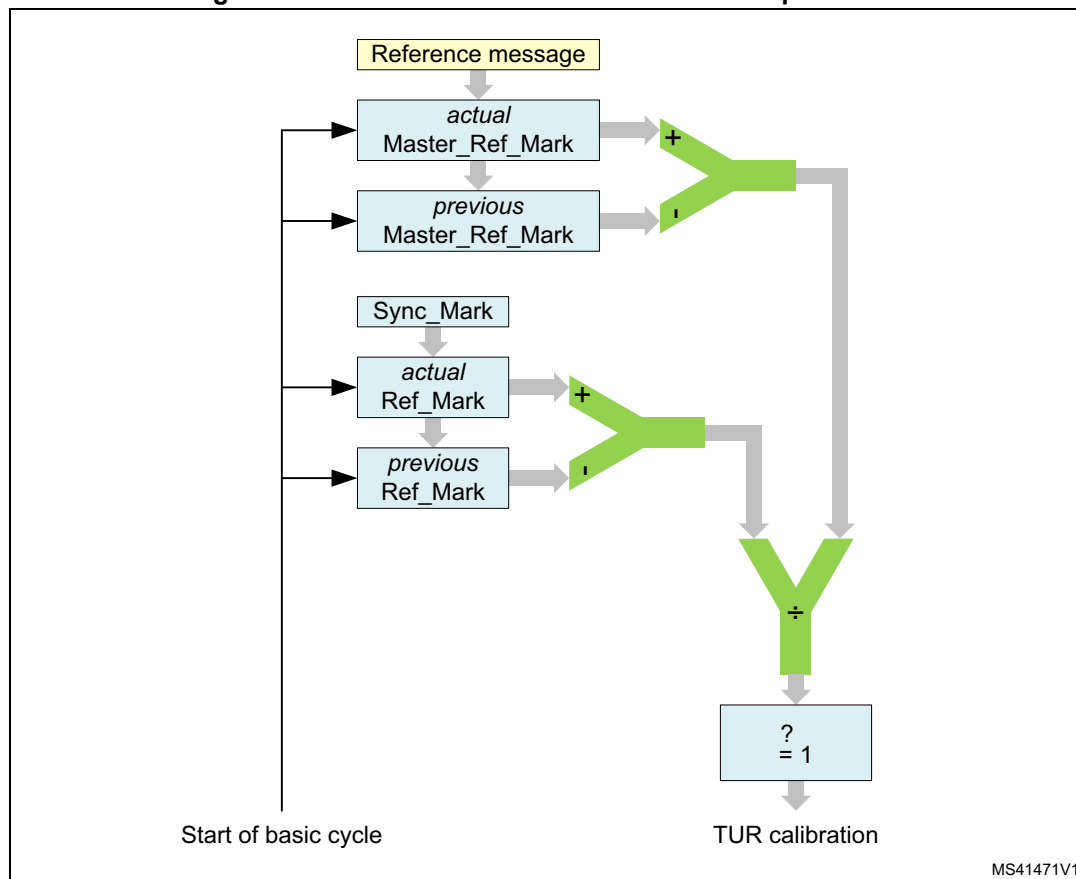

Figure 716 describes how in TTCAN levels 0 and 2 each time receiving node compensates the drift between its own local clock and the time master clock by comparing the length of a basic cycle in local time and in global time. If there is a difference between the two values and the Disc\_Bit in the reference message is not set, a new value for FDCAN\_TURNA.NAV is calculated. If the synchronization deviation  $SD = |NC - FDCAN\_TURNA.NAV| \leq SDL$  (synchronization deviation limit), the new value for FDCAN\_TURNA.NAV takes effect. Else the automatic drift compensation is suspended.

In TTCAN level 0 and level 2, FDCAN\_TTOST.QCS indicates whether the automatic drift compensation is active or suspended. In TTCAN level 1, FDCAN\_TOST.QCS is always 1.

The current time master may synchronize its local clock speed and the global time phase to an external clock source. This is enabled by bit FDCAN\_TTOCF.EECS.

The stop watch function (see Section 61.4.11) may be used to measure the difference in clock speed between the local clock and the external clock. The local clock speed is adjusted by first writing the newly calculated numerator configuration low to

FDCAN\_TURCF.NCL (FDCAN\_TURCF.DC cannot be updated during operation). The new value takes effect by writing FDCAN\_TTOCN.ECS to 1.

The global time phase is adjusted by first writing the phase offset into the TT global time Preset register FDCAN\_TTGTP. The new value takes effect by writing FDCAN\_TTOCN.SGT to 1. The first reference message transmitted after the global time phase adjustment has the Disc\_Bit set to 1.

FDCAN\_TTOST.QGTP shows whether the node global time is in phase with the time master global time. FDCAN\_TTOST.QGTP is permanently 0 in TTCAN level 1 and when the synchronization deviation limit is exceeded in TTCAN level 0, 2 (FDCAN\_TTOST.QCS = 0). It is temporarily 0 while the global time is low-pass filtered to supply the application with a continuous monotonic value. There is no low-pass filtering when the last reference message contained a Disc\_Bit = 1 or when FDCAN\_TTOST.QCS = 0.

### 61.4.13 TTCAN error level

The ISO 11898-4 specifies four levels of error severity:

1. S0 - No error
2. S1 - Warning - Only notification of application, reaction application-specific.
3. S2 error - Notification of application. All transmissions in exclusive or arbitrating time windows are disabled (i.e. no data or remote frames may be started). Potential time masters still transmit reference messages with the reference trigger offset FDCAN\_TTOST.RTO set to the maximum value of 127.
4. S3 - Severe error - Notification of application. All CAN bus operations are stopped, i.e. transmission of dominant bits is not allowed, and FDCAN\_CCCR.MON is set. The S3 error condition remains active until the application updates the configuration (set FDCAN\_CCCR.CCE).

If several errors are detected at the same time, the highest severity prevails. When an error is detected, the application is notified by FDCAN\_TTIR.ELC. The error level is monitored by FDCAN\_TTOST.EL.

The TTCAN signals the following error conditions as required by ISO 11898-4:

- Config\_error (S3)
  - Sets error level FDCAN\_TTOST.EL to 11 when a merged arbitrating time window is not properly closed or when there is a Tx\_Trigger with a time mark beyond the Tx\_Ref\_Trigger.
- Watch\_Trigger\_Reached (S3)
  - Sets error level FDCAN\_TTOST.EL to 11 when a watch trigger was reached because the reference message is missing.
- Application\_Watchdog (S3)
  - Sets error level FDCAN\_TTOST.EL to 11 when the application failed to serve the application watchdog. The application watchdog is configured via FDCAN\_TTOCF.AWL. It is served by reading register FDCAN\_TTOST. When the watchdog is not served in time, bit FDCAN\_TTOST.AWE and interrupt flag

FDCAN\_TTIR.AW are set, all FDCAN communication is stopped, and the FDCAN is set into bus monitoring mode (FDCAN\_CCCR.MON set to 1).

- CAN\_Bus\_Off (S3)
  - Entering CAN\_Bus\_Off state sets error level FDCAN\_TTOST.EL to 11. CAN\_Bus\_Off state is signaled by FDCAN\_PSR.BO = 1 and FDCAN\_CCCR.INIT = 1.
- Scheduling\_Error\_2 (S2)
  - Sets error level FDCAN\_TTOST.EL to 10 if the MSC of one Tx\_Trigger has reached 7. In addition interrupt flag FDCAN\_TTIR.SE2 is set. The error level FDCAN\_TTOST.EL is reset to 00 at the beginning of a matrix cycle when no Tx\_Trigger has an MSC of 7 in the preceding matrix cycle.
- Tx\_Overflow (S2)
  - Sets error level FDCAN\_TTOST.EL to 10 when the Tx count is equal to or higher than the expected number of Tx\_T riggers FDCAN\_TTMLM.ENTT and a Tx\_Trigger event occurs. In addition interrupt flag FDCAN\_TTIR.TXO is set. The error level FDCAN\_TTOST.EL is reset to 00 when the Tx count is no more than FDCAN\_TTMLM.ENTT at the start of a new matrix cycle.
- Scheduling\_Error\_1 (S1)
  - Sets error level FDCAN\_TTOST.EL to 01 if within one matrix cycle the difference between the maximum MSC and the minimum MSC for all trigger memory elements (of exclusive time windows) is larger than two, or if one of the MSCs of an exclusive Rx\_Trigger has reached seven. In addition interrupt flag FDCAN\_TTIR.SE1 is set. If within one matrix cycle none of these conditions is valid, the error level FDCAN\_TTOST.EL is reset to 00.
- Tx\_Underflow (S1)
  - Sets error level FDCAN\_TTOST.EL to 01 when the Tx count is less than the expected number of Tx\_Triggers FDCAN\_TTMLM.ENTT at the start of a new matrix cycle. In addition interrupt flag FDCAN\_TTIR.TXU is set. The error level FDCAN\_TTOST.EL is reset to 00 when the Tx count is at least FDCAN\_TTMLM.ENTT at the start of a new matrix cycle.

### 61.4.14 TTCAN message handling

#### Reference message

For potential time masters the identifier of the reference message is configured via FDCAN\_TTRMC.RID. No dedicated Tx buffer is required for transmission of the reference message. When a reference message is transmitted, the first data byte for TTCAN level 1 (that is, the first four data bytes for TTCAN level 0 and the first four data bytes for TTCAN level 2) is provided by the FSE.

In case the reference message Payload select FDCAN\_TTRMC.RMPS is set, the rest of the reference message payload (level 1: bytes 2-8, level 0, 2: bytes 5-6) is taken from Tx buffer 0. In this case the data length DLC code from message buffer 0 is used.

**Table 482. Number of data bytes transmitted with a reference message**

FDCAN_TTRMC.RMPS	FDCAN_TXBRP.TRP0	Level 0	Level 1	Level 2
0	0	4	1	4
0	1	4	1	4

**Table 482. Number of data bytes transmitted with a reference message (continued)**

FDCAN_TTRMC.RMPS	FDCAN_TXBRP.TRP0	Level 0	Level 1	Level 2
1	0	4	1	4
1	1	4 + MBO	1 + MBO	4 + MBO

To send additional payload with the reference message in level 1 a DLC > 1 must be configured, for level 0 and level 2 a DLC > 4 is required. In addition the transmission request pending bit FDCAN\_TXBRP.TRP0 of message buffer 0 must be set (see [Table 482](#)). In case bit FDCAN\_TXBRP.TRP0 is not set when a reference message is started, the reference message is transmitted with the data bytes supplied by the FSE only.

For acceptance filtering of reference messages the reference identifier FDCAN\_TTRMC.RID is used.

### Message reception

Message reception is done via the two Rx FIFOs in the same way as for event-driven CAN communication (see [Rx handler](#)).

The message status count MSC is part of the corresponding trigger memory element and must be initialized to 0 during configuration. It is updated while the TTCAN is in synchronization states In\_Gap or In\_Schedule. The update happens at the message Rx\_Trigger. At this point in time it is checked at which acceptance filter element the latest message received in this basic cycle had matched. The matching filter number is stored as the acceptance filter result. If this is the same the filter number as defined in this trigger memory element, the MSC is decremented by one. If the acceptance filter result is not the same filter number as defined for this filter element, or if the acceptance filter result is cleared, the MSC is incremented by one. At each Rx\_Trigger and at each start of cycle, the last acceptance filter result is cleared.

The time mark of an Rx\_Trigger should be set to a value where it is ensured that reception and acceptance filtering for the targeted message has completed. This has to take into consideration the RAM access time and the order of the filter list. It is recommended, that filters which are used for Rx\_Triggers are placed at the beginning of the filter list. It is not recommended to use an Rx\_Trigger for the reference message.

### Message transmission

For time-triggered message transmission the TTCAN supplies 32 dedicated Tx buffers (see [Transmit pause](#)). A Tx FIFO or Tx queue is not available when the FDCAN is configured for time-triggered operation (FDCAN\_TTOCF.OM = 01 or 10).

Each Tx\_Trigger in the trigger memory points to a particular Tx buffer containing a specific message. There may be more than one Tx\_Trigger for a given Tx buffer if that Tx buffer contains a message that is to be transmitted more than once in a basic cycle or matrix cycle.

The application program has to update the data regularly and on time, synchronized to the cycle time. The user is responsible that no partially updated messages are transmitted. To assure this the user has to proceed in the following way:

Tx\_Trigger\_Single / Tx\_Trigger\_Merged / Tx\_Trigger\_Arbitration

- Check whether the previous transmission has completed by reading FDCAN\_TXBTO
- Update the Tx buffer configuration and/or payload
- Issue an add request to set the Tx buffer request pending bit

Tx\_Trigger\_Continuous

- Issue a cancellation request to reset the Tx buffer request pending bit
- Check whether the cancellation has finished by reading FDCAN\_TXBCF
- Update Tx buffer configuration and/or payload
- Issue an add request to set the Tx buffer request pending bit

The message MSC stored with the corresponding Tx\_Trigger provides information on the success of the transmission.

The MSC is incremented by one when the transmission cannot be started because the CAN bus was not idle within the corresponding transmit enable window or when the message was started and cannot be completed successfully. The MSC is decremented by one when the message was transmitted successfully or when the message may have been started within its transmit enable window but was not started because transmission was disabled (TTCAN in error level S2 or user has disabled this particular message).

The Tx buffers may be managed dynamically, i.e. several messages with different identifiers may share the same Tx buffer element. In this case the user must ensure that no transmission request is pending for the Tx buffer element to be reconfigured by checking FDCAN\_TXBRP.

If a Tx buffer with pending transmission request should be updated, the user must first issue a cancellation request and check whether the cancellation has completed by reading FDCAN\_TXBCF before it starts updating.

The Tx handler transfers a message from the message RAM to its intermediate output buffer at the trigger element, which becomes active immediately before the Tx\_Trigger element (which defines the beginning of the transmit window). During and after the transfer time the transmit message may not be updated and its FDCAN\_TXBRP bit may not be changed. To control this transfer time, an additional trigger element may be placed before the Tx\_Trigger. This may be example of a Time\_Base\_Trigger which need not cause any other action. The difference in time marks between the Tx\_Trigger and the preceding trigger must be large enough to guarantee that the Tx handler can read four words from the message RAM even at high RAM access load from other modules.

### Transmission in exclusive time windows

A transmission is started time-triggered when the cycle time reaches the time mark of a Tx\_Trigger\_Single or Tx\_Trigger\_Continuous. There is no arbitration on the bus with messages from other nodes. The MSC is updated according the result of the transmission attempt. After successful transmission started by a Tx\_Trigger\_Single the respective Tx buffer request pending bit is reset. After successful transmission started by a Tx\_Trigger\_Continuous the respective Tx buffer request pending remains set. When the transmission was not successful due to disturbances, it is repeated next time (one of) its Tx\_Trigger(s) become(s) active.

### Transmission in arbitrating time windows

A transmission is started time-triggered when the cycle time reaches the time mark of a Tx\_Trigger\_Arbitration. Several nodes may start to transmit at the same time. In this case the message has to arbitrate with the messages from other nodes. The MSC is not updated. When the transmission was not successful (lost arbitration or disturbance), it is repeated next time (one of) its Tx\_Trigger(s) become(s) active.

### Transmission in merged arbitrating time windows

The purpose of a merged arbitrating time window is, to enable multiple nodes to send a limited number of frames which are transmitted in immediate sequence, the order given by CAN arbitration. It is not intended for burst transmission by a node. Since the node does not have exclusive access within this time window, it may happen that not all requested transmissions are successful.

Messages which have lost arbitration or were disturbed by an error, may be re-transmitted inside the same merged arbitrating time window. The re-transmission is not started if the corresponding transmission request pending flag is reset by a successful Tx cancellation.

In single transmit windows, the Tx handler transmits the message indicated by the message number of the trigger element. In merged arbitrating time windows, it can handle up to three message numbers from the trigger list. Their transmission is attempted in the sequence defined by the trigger list. If the time mark of a fourth message is reached before the first is transmitted (or canceled by the user), the fourth request is ignored.

The transmission inside a merged arbitrating time window is not time-triggered. The transmission of a message may start before its time mark, or after the time mark if the bus was not idle.

The messages transmitted by a specific node inside a merged arbitrating time window are started in the order of their Tx\_Triggers, so a message with low CAN priority may prevent the successful transmission of a following message with higher priority, if their is compelling bus traffic. This must be considered for the configuration of the trigger list.

Time\_Base\_Triggers may be placed between consecutive Tx\_Triggers to define the time until the data of the corresponding Tx buffer needs to be updated.

## 61.4.15 TTCAN interrupt and error handling

The TT interrupt register FDCAN\_TTIR consists of four segments. Each interrupt can be enabled separately by the corresponding bit in the TT interrupt enable register FDCAN\_TTIE. The flags remain set until the user clears them. A flag is cleared by writing a 1 to the corresponding bit position.

The first segment consists of flags CER, AW, WT, and IWT. Each flag indicates a fatal error condition where the CAN communication is stopped. With the exception of IWT, these error conditions require a re-configuration of the FDCAN module before the communication can be restarted.

The second segment consists of flags ELC, SE1, SE2, TXO, TXU, and GTE. Each flag indicates an error condition where the CAN communication is disturbed. If they are caused by a transient failure, for example by disturbances on the CAN bus, they are handled by the FDCAN protocol failure handling and do not require intervention by the application program.

The third segment consists of flags GTD, GTW, SWE, TTMI, and RTMI. The first two flags are controlled by global time events (level 0, 2 only) that require a reaction by the application program. With a stop watch event triggered by a rising edge on pin fdcan\_swt internal time

values are captured. The trigger time mark interrupt notifies the application that a specific Time\_Base\_Trigger is reached. The register time mark interrupt signals that the time referenced by FDCAN\_TTOCN.TMC (cycle, local, or global) is equal to the time mark FDCAN\_TTTMK.TM. It can also be used to finish a gap.

The fourth segment consists of flags SOG, CSM, SMC, and SBC. These flags provide a means to synchronize the application program to the communication schedule.

#### 61.4.16 Level 0

TTCAN level 0 is not part of ISO11898-4. This operation mode makes the hardware, that in TTCAN level 2 maintains the calibrated global time base, also available for event-driven CAN according to ISO11898-1.

Level 0 operation is configured via FDCAN\_TTOCF.OM = 11. In this mode the FDCAN operates in event driven CAN communication, there is no fixed schedule, the configuration of FDCAN\_TTOCF.GEN is ignored. External event-synchronized operation is not available in level 0. A synchronized time base is maintained by transmission of reference messages.

In level 0 the trigger memory is not active and therefore needs not to be configured. The time mark interrupt flag (FDCAN\_TTIR.TTMI) is set when the cycle time has reached FDCAN\_TTOCF.IRTO = 0x200, it reminds the user to set a transmission request for message buffer 0. The Watch\_Trigger interrupt flag (FDCAN\_TTIR.WT) is set when the cycle time has reached 0xFF00. These values were chosen to have enough margin for a stable clock calibration. There are no further TT-error-checks.

Register time mark interrupts (FDCAN\_TTIR.RTMI) are also possible.

The reference message is configured as for level 2 operation. Received reference messages are recognized by the identifier configured in register FDCAN\_TTRMC. For the transmission of reference messages only message buffer 0 may be used. The node transmits reference messages any time the user sets a transmission request for message buffer 0, there is no reference trigger offset.

Level 0 operation is configured via:

- FDCAN\_TTRMC
- FDCAN\_TTOCF except EVTP, AWL, GEN
- FDCAN\_TTMLM except ENTT, TXEW
- FDCAN\_TURCF

Level 0 operation is controlled via:

- FDCAN\_TTOCN except NIG, TMG, FGP, GCS, TTMIE
- FDCAN\_TTGTP
- FDCAN\_TTTMK
- FDCAN\_TTIR excluding bits CER, AW, IWT SE2, SE1, TXO, TXU, SOG (no function)
- FDCAN\_TTIR the following bits have changed function
  - TTMI not defined by trigger memory - activated at cycle time FDCAN\_TTOCF.IRTO 0x200
  - WT not defined by trigger memory - activated at cycle time 0xFF00

Level 0 operation is signaled via:

- TTOST excluding bits AWE, WFE, GSI, GFI, RTO (no function)

**Synchronizing**

Figure 717 describes the states and the state transitions in TTCAN level 0 operation. level 0 has no In\_Gap state.

**Figure 717. Level 0 schedule synchronization state machine**

**Handling of error levels**

During level 0 operation only the following error conditions may occur:

- Watch\_Trigger\_Reached (S3), reached cycle time 0xFF00
- CAN\_Bus\_Off (S3)

Since no S1 and S2 errors are possible, the error level can only switch between S0 (No error) and S3 (Severe error). In TTCAN level 0 an S3 error is handled differently. When error level S3 is reached, both FDCAN\_TTOST.SYS and FDCAN\_TTOST.MS are reset, and interrupt flags FDCAN\_TTIR.GTE and FDCAN\_TTIR.GTD are set.

When error level S3 (FDCAN\_TTOST.EL = 11) is entered, bus monitoring mode is (contrary to TTCAN level 1 and level 2) not entered. S3 error level is left automatically after transmission (time master) or reception (time slave) of the next reference message.

### Master slave relation

Figure 718 describes the master slave relation in TTCAN level 0. In case of an S3 error the FDCAN returns to state Master\_Off.

Figure 718. Level 0 master to slave relation

### 61.4.17 Synchronization to external time schedule

This feature can be used to synchronize the phase of the FDCAN schedule to an external schedule (for example that of a second TTCAN network or FlexRay network). It is applicable only when the FDCAN is current time master (FDCAN\_TTOST.MS = 11).

External synchronization is controlled by event trigger input pin `fdcan_evt`. If bit `FDCAN_TTOCN.ESCN` is set, a rising edge at event trigger pin `fdcan_evt` the FDCAN compares its actual cycle time with the target phase value configured by `FDCAN_TTGTP.CTP`.

Before setting `FDCAN_TTOCN.ESCN` the user has to adapt the phases of the two time schedules for example by using the FDCAN gap control (see Section 61.4.10). When the user sets `FDCAN_TTOCN.ESCN`, `FDCAN_TTOSTSPL` is set.

If the difference between the cycle time and the target phase value `FDCAN_TTGTP.CTP` at the rising edge at event trigger pin `fdcan_evt` is greater than 9 NTU, the phase lock bit `FDCAN_TTOST.SPL` is reset, and interrupt flag `FDCAN_TTIR.CSM` is set.

FDCAN\_TTOST.SPL is also reset (and FDCAN\_TTIR.CSM is set), when another node becomes time master.

If both FDCAN\_TTOST.SPL and FDCAN\_TTOCN.ESCN are set, and if the difference between the cycle time and the target phase value FDCAN\_TTGTP.CTP at the rising edge at event trigger pin fdcan\_evt is lower or equal to nine NTU, the phase lock bit FDCAN\_TTOST.SPL remains set, and the measured difference is used as reference trigger offset value to adjust the phase at the next transmitted reference message.

*Note:* The rising edge detection at event trigger pin fdcan\_evt is enabled with the start of each basic cycle. The first rising edge triggers the compare of the actual cycle time with FDCAN\_TTGTP.CTP. All further edges until the beginning of the next basic cycle are ignored.

### 61.4.18 FDCAN Rx buffer and FIFO element

Up to 64 Rx buffers and two Rx FIFOs can be configured in the message RAM. Each Rx FIFO section can be configured to store up to 64 received messages. The structure of a Rx buffer / FIFO element is shown in [Table 483](#), the description is provided in [Table 484](#).

**Table 483. Rx buffer and FIFO element**

Bit	31	24	23	16	15	8	7	0
R0	ESI	XTD	RTR	ID[28:0]				
R1	ANMF	FIDX[6:0]		Res.	FDX	BRS	DLC[3:0]	RXTS[15:0]
R2	DB3[7:0]			DB2[7:0]		DB1[7:0]	DB0[7:0]	
R3	DB7[7:0]			DB6[7:0]		DB5[7:0]	DB4[7:0]	
⋮	⋮			⋮		⋮		
Rn	DBm[7:0]			DBm-1[7:0]		DBm-2[7:0]	DBm-3[7:0]	

The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register FDCAN\_RXESC.

**Table 484. Rx buffer and FIFO element description**

Field	Description
R0 bit 31 ESI	Error state indicator 0: Transmitting node is error active 1: Transmitting node is error passive
R0 bit 30 XTD	Extended identifier Signals to the user whether the received frame has a standard or extended identifier. 0: 11-bit standard identifier 1: 29-bit extended identifier
R0 bit 29 RTR	Remote transmission request Signals to the user whether the received frame is a data frame or a remote frame. 0: Received frame is a data frame 1: Received frame is a remote frame

**Table 484. Rx buffer and FIFO element description (continued)**

Field	Description
R0 bits 28:0 ID[28:0]	Identifier Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].
R1 bit 31 ANMF	Accepted non-matching frame Acceptance of non-matching frames may be enabled via FDCAN_GFC.ANFS and FDCAN_GFC.ANFE. 0: Received frame matching filter index FIDX 1: Received frame did not match any Rx filter element
R1 bits 30:24 FIDX[6:0]	Filter index 0-127 = index of matching Rx acceptance filter element (invalid if ANMF = 1). Range is 0 to FDCAN_SIDFC.LSS. - 1 or FDCAN_XIDFC.LSE. - 1.
R1 bit 21 FDF	FD Format 0: Standard frame format 1: FDCAN frame format (new DLC-coding and CRC)
R1 bit 20 BRS	Bitrate Switch 0: Frame received without bitrate switching 1: Frame received with bitrate switching
R1 bits 19:16 DLC[3:0]	Data length code 0-8: Classic CAN + CAN FD: received frame has 0-8 data bytes 9-15: Classic CAN: received frame has 8 data bytes 9-15: CAN FD: received frame has 12/16/20/24/32/48/64 data bytes
R1 bits 15:0 RXTS[15:0]	Rx timestamp Timestamp counter value captured on start of frame reception. Resolution depending on configuration of the timestamp counter prescaler FDCAN_TSCC.TCP.
R2 bits 31:24 DB3[7:0]	Data Byte 3
R2 bits 23:16 DB2[7:0]	Data Byte 2
R2 bits 15:8 DB1[7:0]	Data Byte 1
R2 bits 7:0 DB0[7:0]	Data Byte 0
R3 bits 31:24 DB7[7:0]	Data Byte 7
R3 bits 23:16 DB6[7:0]	Data Byte 6
R3 bits 15:8 DB5[7:0]	Data Byte 5
R3 bits 7:0 DB4[7:0]	Data Byte 4
⋮	⋮

**Table 484. Rx buffer and FIFO element description (continued)**

Rn bits 7:0 DBm-3[7:0]	Data Byte m-3

### 61.4.19 FDCAN Tx buffer element

The Tx buffers section can be configured to hold dedicated Tx buffers as well as a Tx FIFO / Tx queue. In case that the Tx buffers section is shared by dedicated Tx buffers and a Tx FIFO / Tx queue, the dedicated Tx buffers start at the beginning of the Tx buffers section followed by the buffers assigned to the Tx FIFO or Tx queue. The Tx handler distinguishes between dedicated Tx buffers and Tx FIFO / Tx queue by evaluating the Tx buffer configuration FDCAN\_TXBC.TFQS and FDCAN\_TXBC.NDTB. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register FDCAN\_TXESC.

**Table 485. Tx buffer and FIFO element**

Bit	31	24	23	16	15	8	7	0	
T0	ESI	XTD	RTR	ID[28:0]					
T1	MM[7:0]			EFC	Res.	FDL	BPS	DLC[3:0]	Reserved
T2	DB3[7:0]			DB2[7:0]			DB1[7:0]	DB0[7:0]

**Table 486. Tx buffer element description (continued)**

Field	Description
Tn bits 15:8 DBm-2[7:0]	Data Byte m-2
Tn bits 7:0 DBm-3[7:0]	Data Byte m-3

1. The ESI bit of the transmit buffer is OR-ed with the error passive flag to decide the value of the ESI bit in the transmitted FD frame. As required by the CAN FD protocol specification, an error active node may optionally transmit the ESI bit recessive, but an error passive node always transmit the ESI bit recessive.
2. When RTR = 1, the FDCAN transmits a remote frame according to ISO11898-1, even if FDCAN\_CCCR.FDOE enables the transmission in CAN FD format.
3. Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled FDCAN\_CCCR.FDOE = 1. Bit BRS is only evaluated when in addition FDCAN\_CCCR.BRSE = 1.

### 61.4.20 FDCAN Tx event FIFO element

Each element stores information about transmitted messages. By reading the Tx event FIFO the user gets this information in the order the messages were transmitted. Status information about the Tx event FIFO can be obtained from register FDCAN\_TXEFS.

**Table 487. Tx Event FIFO element**

Bit	31	24	23	16	15	8	7	0
E0	ESI	XTD	RTR	ID[28:0]				
E1	MM[7:0]			ET[1:0]	EDL	BRS	DLC[3:0]	TXTS[15:0]

**Table 488. Tx Event FIFO element description**

Field	Description
E0 bit 31 ESI	Error state indicator – 0: Transmitting node is error active – 1: Transmitting node is error passive
E0 bit 30 XTD	Extended Identifier – 0: 11-bit standard identifier – 1: 29-bit extended identifier
E0 bit 29 RTR	Remote transmission request – 0: Transmit data frame – 1: Transmit remote frame
E0 bits 28:0 ID[28:0]	Identifier Standard or extended identifier depending on bit XTD. A standard identifier must be written to ID[28:18].
E1 bits 31:24 MM[7:0]	Message marker Copied from Tx buffer into Tx event FIFO element for identification of Tx message status.

**Table 488. Tx Event FIFO element description (continued)**

Field	Description
E1 bits 23:22 EFC	Event type – 00: Reserved – 01: Tx event – 10: Transmission in spite of cancellation (always set for transmissions in DAR mode) – 11: Reserved
E1 bit 21 EDL	Extended data length – 0: Standard frame format – 1: FDCAN frame format (new DLC-coding and CRC)
E1 bit 20 BRS	Bitrate switching – 0: Frame transmitted without bitrate switching – 1: Frame transmitted with bitrate switching
T1 bits 19:16 DLC[3:0]	Data length code – 0 - 8: Frame with 0-8 data bytes transmitted – 9 - 15: Frame with eight data bytes transmitted
E1 bits 15:0 TXTS[15:0]	Tx timestamp Timestamp counter value captured on start of frame transmission. Resolution depending on configuration of the timestamp counter prescaler FDCAN_TSCC.TCP.

**61.4.21 FDCAN standard message ID filter element**

Up to 128 filter elements can be configured for 11-bit standard IDs. When accessing a standard message ID filter element, its address is the filter list standard start address FDCAN\_SIDFC.FLSSA plus the index of the filter element (0 ... 127).

**Table 489. Standard message ID filter element**

Bit	31	24	23	16	15	8	7	0
S0	SFT[1:0]	SFEC[2:0]	SFID1[10:0]			Res.	SFID2[10:0]	

Table 490. Standard message ID filter element field description

Field	Description	
Bit 31:30 SFT[1:0] <sup>(1)</sup>	Standard filter type <ul style="list-style-type: none"> <li>– 00: Range filter from SFID1 to SFID2</li> <li>– 01: Dual ID filter for SFID1 or SFID2</li> <li>– 10: Classic filter: SFID1 = filter, SFID2 = mask</li> <li>– 11: Filter element disabled</li> </ul>	
Bit 29:27 SFEC[2:0]	Standard filter element configuration All enabled filter elements are used for acceptance filtering of standard frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If SFEC = “100”, “101”, or “110” a match sets interrupt flag FDCAN_IR.HPM and, if enabled, an interrupt is generated. In this case register FDCAN_HPMS is updated with the status of the priority match. <ul style="list-style-type: none"> <li>– 000: Disable filter element</li> <li>– 001: Store in Rx FIFO 0 if filter matches</li> <li>– 010: Store in Rx FIFO 1 if filter matches</li> <li>– 011: Reject ID if filter matches</li> <li>– 100: Set priority if filter matches</li> <li>– 101: Set priority and store in FIFO 0 if filter matches</li> <li>– 110: Set priority and store in FIFO 1 if filter matches</li> <li>– 111: Store into Rx buffer or as debug message, configuration of FDCAN_SFT[1:0] ignored</li> </ul>	
Bits 26:16 SFID1[10:0]	Standard filter ID 1 First ID of standard ID filter element. When filtering for Rx buffers or for debug messages this field defines the ID of a standard message to be stored. The received identifiers must match exactly, no masking mechanism is used.	
Bits 15:0	SFID2[15:10]	Standard filter ID 2 This bit field has a different meaning depending on the configuration of SFEC: <ul style="list-style-type: none"> <li>– SFEC = 001 ... 110 Second ID of standard ID filter element</li> <li>– SFEC = 111 Filter for Rx buffers or for debug messages</li> </ul>
	SFID2[10:9]	Decides whether the received message is stored into an Rx buffer or treated as message A, B, or C of the debug message sequence. <ul style="list-style-type: none"> <li>– 00: Store message into an Rx buffer</li> <li>– 01: Debug message A</li> <li>– 10: Debug message B</li> <li>– 11: Debug message C</li> </ul>
	SFID2[8:6]	Is used to control the filter event pins at the Extension Interface. A 1 at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one fdcan_pclk period in case the filter matches. SFID2[8] is used by the calibration unit.
	SFID2[5:0]	Defines the offset to the Rx buffer start address FDCAN_RXBC.RBSA for storage of a matching message.

1. With SFT = “11” the filter element is disabled and the acceptance filtering continues (same behavior as with SFEC = “000”).

**Note:** In case a reserved value is configured, the filter element is considered disabled.

### 61.4.22 FDCAN extended message ID filter element

Up to 64 filter elements can be configured for 29-bit extended IDs. When accessing an Extended message ID filter element, its address is the filter list extended start address FDCAN\_XIDFC.FLESA plus two times the index of the filter element (0 ... 63).

**Table 491. Extended message ID filter element**

Bit	31	30	29	28	0
F0	EFEC[2:0]			EFID1[28:0]	
F1	EFTI[1:0]		Reserved	EFID2[28:0]	

**Table 492. Extended message ID filter element field description**

Field	Description
F0 bits 31:29 EFEC[2:0]	<p>Extended filter element configuration</p> <p>All enabled filter elements are used for acceptance filtering of extended frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If EFEC = 100, 101, or 110 a match sets interrupt flag FDCAN_IR.HPM and, if enabled, an interrupt is generated. In this case register FDCAN_HPMS is updated with the status of the priority match.</p> <ul style="list-style-type: none"> <li>– 000: Disable filter element</li> <li>– 001: Store in Rx FIFO 0 if filter matches</li> <li>– 010: Store in Rx FIFO 1 if filter matches</li> <li>– 011: Reject ID if filter matches</li> <li>– 100: Set priority if filter matches</li> <li>– 101: Set priority and store in FIFO 0 if filter matches</li> <li>– 110: Set priority and store in FIFO 1 if filter matches</li> <li>– 111: Store into Rx buffer, configuration of EFTI[1:0] ignored</li> </ul>
F0 bits 28:0 EFID1[28:0]	<p>Extended filter ID 1</p> <p>First ID of extended ID filter element.</p> <p>When filtering for Rx buffers or for debug messages this field defines the ID of an extended message to be stored. The received identifiers must match exactly, only FDCAN_XIDAM masking mechanism.</p>
F1 bits 31:30 EFTI[1:0]	<p>Extended filter type</p> <ul style="list-style-type: none"> <li>– 00: Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID)</li> <li>– 01: Dual ID filter for EF1ID or EF2ID</li> <li>– 10: Classic filter: EF1ID = filter, EF2ID = mask</li> <li>– 11: Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID), FDCAN_XIDAM mask not applied</li> </ul>

**Table 492. Extended message ID filter element field description (continued)**

Field		Description
F1 bits 28:0	EFID2[10:0]	Extended filter ID 2 This bit field has a different meaning depending on the configuration of EFEC: – SFEC = 001 ... 110 Second ID of extended ID filter element – SFEC = 111 Filter for Rx buffers or for debug messages
	EFID2[10:9]	Decides whether the received message is stored into an Rx buffer or treated as message A, B, or C of the debug message sequence. – 00: Store message into an Rx buffer – 01: Debug message A – 10: Debug message B – 11: Debug message C
	EFID2[8:6]	Is used to control the filter event pins at the Extension Interface. A 1 at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one fdcan_pclk period in case the filter matches. EFID2[8] interface is used by the calibration unit.
	EFID2[5:0]	Defines the offset to the Rx buffer start address FDCAN_RXBC.RBSA for storage of a matching message.

### 61.4.23 FDCAN trigger memory element

Up to 64 trigger memory elements can be configured. When accessing a trigger memory element, its address is the trigger memory start address FDCAN\_TTTMC.TMSA plus the index of the trigger memory element (0 ... 63).

**Table 493. Trigger memory element**

Bit	31	24	23	16	15	8	7				0
T0	TM[15:0]			Res.	CC[6:0]	Res.	TMIN	TMEX	TYPE[3:0]		
T1	Res.	FTYPE	MNR[6:0]	Res.				MSC[2:0]			

**Table 494. Trigger memory element description**

Field	Description
T0 bits 31:16 TM[15:0]	Time mark Cycle time for which the trigger becomes active.
T0 bit 14:8 CC[6:0]	Cycle code Cycle count for which the trigger is valid. Ignored for trigger types Tx_Ref_Trigger, Tx_Ref_Trigger_Gap, Watch_Trigger, Watch_Trigger_Gap, End_of_List. – 0b000000x valid for all cycles – 0b000001c valid every 2 <sup>nd</sup> cycle at cycle count mod2 = c – 0b00001cc valid every 4 <sup>th</sup> cycle at cycle count mod4 = cc – 0b0001ccc valid every 8 <sup>th</sup> cycle at cycle count mod8 = ccc – 0b001cccc valid every 16 <sup>th</sup> cycle at cycle count mod16 = cccc – 0b01ccccc valid every 32 <sup>nd</sup> cycle at cycle count mod32 = ccccc – 0b1cccccc valid every 64 <sup>th</sup> cycle at cycle count mod64 = ccccc

**Table 494. Trigger memory element description (continued)**

Field	Description
T0 bit 5 TMIN	Time mark event internal – 0: No action – 1: FDCAN_TTIR.TTMI is set when trigger memory element becomes active
T0 bit 4 TMEX	Time mark event external – 0: No action – 1: Pulse at output fdcan1_tmp for more than one instance and fdcan_tmp if only one instance with the length of one period is generated when the time arc of the trigger memory element becomes active and FDCAN_TTOCN.TTMIE = 1
T0 bit 3:0 TYPE[3:0]	Trigger type – 0000 Tx_Ref_Trigger - valid when not in gap – 0001 Tx_Ref_Trigger_Gap - valid when in gap – 0010 Tx_Trigger_Single - starts a single transmission in an exclusive time window – 0011 Tx_Trigger_Continuous - starts continuous transmission in an exclusive time window – 0100 Tx_Trigger_Arbitration - starts a transmission in an arbitrating time window – 0101 Tx_Trigger_Merged - starts a merged arbitration window – 0110 Watch_Trigger - valid when not in gap – 0111 Watch_Trigger_Gap - valid when in gap – 1000 Rx_Trigger - check for reception – 1001 Time_Base_Trigger - only control TMIN, TMEX – 1010 ... 1111=End_of_List - illegal type, causes configuration error
T1 bit 23FTYPE	Filter type – 0: 11-bit standard message ID – 1: 29-bit extended message ID
T1 bit 22:16 MNR[6:0] <sup>(1)</sup>	Message number – Transmission: trigger is valid for configured Tx buffer number. Valid values are 0 to 31. – Reception: trigger is valid for standard/extended message ID filter element number. Valid values are, respectively 0 to 63 and 0 to 127.
T1 bits 2:0 MSC[2:0]	Message status count Counts scheduling errors for periodic messages in exclusive time windows. It has no function for arbitrating messages and in event-driven CAN communication (ISO11898-1). – 0-7= Actual status

1. The trigger memory elements have to be written when the FDCAN is in INIT state. Write access to the trigger memory elements outside INIT state is not allowed. There is an exception for TMIN and TMEX when they are defined as part of a trigger memory element of TYPE Tx\_Ref\_Trigger. In this case they become active at the time mark modified by the actual reference trigger offset (TTOST[RTO]).

## 61.5 FDCAN registers

### 61.5.1 FDCAN core release register (FDCAN\_CREL)

Address offset: 0x0000

Reset value: 0x3214 1218

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REL[3:0]				STEP[3:0]				SUBSTEP[3:0]				YEAR[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MON[7:0]								DAY[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 **REL[3:0]**: Core release = 3

Bits 27:24 **STEP[3:0]**: Step of core release = 2

Bits 23:20 **SUBSTEP[3:0]**: Sub-step of core release = 1

Bits 19:16 **YEAR[3:0]**: Timestamp year = 4

Bits 15:8 **MON[7:0]**: Timestamp month = 12

Bits 7:0 **DAY[7:0]**: Timestamp day = 18

### 61.5.2 FDCAN Endian register (FDCAN\_ENDN)

Address offset: 0x0004

Reset value: 0x8765 4321

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ETV[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ETV[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **ETV[31:0]**: Endiannes test value

The endianness test value is 0x8765 4321.

### 61.5.3 FDCAN data bit timing and prescaler register (FDCAN\_DBTP)

Address offset: 0x000C

Reset value: 0x0000 0A33

This register is dedicated to data bit timing phase and only writable if bits FDCAN\_CCCR.CCE and FDCAN\_CCCR.INIT are set. The CAN time quantum may be programmed in the range from 1 to 32 FDCAN clock periods.  $t_q = (DBRP + 1)$  FDCAN clock periods.

DTSEG1 is the sum of Prop\_Seg and Phase\_Seg1. DTSEG2 is Phase\_Seg2. Therefore the length of the bit time is  $(DTSEG1 + DTSEG2 + 3) t_q$  for programmed values, or  $(Sync\_Seg + Prop\_Seg + Phase\_Seg1 + Phase\_Seg2) t_q$  for functional values.

The information processing time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TDC	Res.	Res.	DBRP[4:0]				
								rw			rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DTSEG1[4:0]					DTSEG2[3:0]			DSJW[3:0]				
			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **TDC**: Transceiver delay compensation  
 0: Transceiver delay compensation disabled  
 1: Transceiver delay compensation enabled

Bits 22:21 Reserved, must be kept at reset value.

Bits 20:16 **DBRP[4:0]**: Data bitrate prescaler  
 The value by which the oscillator frequency is divided to generate the bit time quanta. The bit time is built up from a multiple of these quanta. Valid values for the baudrate prescaler are 0 to 31. The hardware interpreters this value as the programmed value plus 1.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **DTSEG1[4:0]**: Data time segment before sample point  
 Valid values are 0 to 31. The value used by the hardware is the one programmed, incremented by 1, i.e.  $t_{BS1} = (DTSEG1 + 1) \times t_q$ .

Bits 7:4 **DTSEG2[3:0]**: Data time segment after sample point  
 Valid values are 0 to 15. The value used by the hardware is the one programmed, incremented by 1, i.e.  $t_{BS2} = (DTSEG2 + 1) \times t_q$ .

Bits 3:0 **DSJW[3:0]**: Synchronization jump width  
 Must always be smaller than DTSEG2, valid values are 0 to 15. The value used by the hardware is the one programmed, incremented by 1, i.e.  $t_{SJW} = (DSJW + 1) \times t_q$ .

*Note:* With a FDCAN clock of 8 MHz, the reset value 0x00000A33 configures the FDCAN for a fast bitrate of 500 kbit/s.

### 61.5.4 FDCAN test register (FDCAN\_TEST)

Write access to this register must be enabled by setting bit FDCAN\_CCCR.TEST to 1. All register functions are set to their reset values when bit FDCAN\_CCCR.TEST is reset.

Loop back mode and software control of Tx pin FDCANx\_TX are hardware test modes. Programming TX differently from 00 may disturb the message transfer on the CAN bus.

Address offset: 0x0010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RX	TX[1:0]		LBCK	Res.	Res.	Res.	Res.
								r	nw	nw	nw				

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **RX**: Receive pin

Monitors the actual value of transmit pin FDCANx\_RX

0: The CAN bus is dominant (FDCANx\_RX = 0)

1: The CAN bus is recessive (FDCANx\_RX = 1)

Bits 6:5 **TX[1:0]**: Control of transmit pin

00: Reset value , FDCANx\_TX TX is controlled by the CAN core, updated at the end of the CAN bit time

01: Sample point can be monitored at pin FDCANx\_TX

10: Dominant (0) level at pin FDCANx\_TX

11: Recessive (1) at pin FDCANx\_TX

Bit 4 **LBCK**: Loop back mode

0: Reset value, loop back mode is disabled

1: Loop back mode is enabled (see [Test modes](#))

Bits 3:0 Reserved, must be kept at reset value.

### 61.5.5 FDCAN RAM watchdog register (FDCAN\_RWD)

The RAM watchdog monitors the READY output of the message RAM. A message RAM access starts the message RAM watchdog counter with the value configured by the FDCAN\_RWD.WDC bits.

The counter is reloaded with FDCAN\_RWD.WDC bits when the message RAM signals successful completion by activating its READY output. In case there is no response from the message RAM until the counter has counted down to 0, the counter stops and interrupt flag FDCAN\_IR.WDI bit is set. The RAM watchdog counter is clocked by the fdcan\_pclk clock.

Address offset: 0x0014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

WDV[7:0]								WDC[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **WDV[7:0]**: Watchdog value  
Actual message RAM watchdog counter value.

Bits 7:0 **WDC[7:0]**: Watchdog configuration  
Start value of the message RAM watchdog counter. With the reset value of 00 the counter is disabled.  
These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

### 61.5.6 FDCAN CC control register (FDCAN\_CCCR)

Address offset: 0x0018

Reset value: 0x0000 0001

For details about setting and resetting of single bits, see [Software initialization](#).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NISO	TXP	EFBI	PXHD	Res.	Res.	BRSE	FDOE	TEST	DAR	MON	CSR	CSA	ASM	CCE	INIT
r	r	r	r			r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **NISO**: Non ISO operation  
If this bit is set, the FDCAN uses the CAN FD frame format as specified by the Bosch CAN FD Specification V1.0.  
0: CAN FD frame format according to ISO11898-1  
1: CAN FD frame format according to Bosch CAN FD Specification V1.0

Bit 14 **TXP**:  
If this bit is set, the FDCAN pauses for two CAN bit times before starting the next transmission after successfully transmitting a frame.  
0: Disabled  
1: Enabled

Bit 13 **EFBI**: Edge filtering during bus integration  
0: Edge filtering disabled  
1: Two consecutive dominant tq required to detect an edge for hard synchronization

Bit 12 **PXHD**: Protocol exception handling disable

0: Protocol exception handling enabled

1: Protocol exception handling disabled

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **BRSE**: FDCAN bitrate switching

0: Bitrate switching for transmissions disabled

1: Bitrate switching for transmissions enabled

Bit 8 **FDOE**: FD operation enable

0: FD operation disabled

1: FD operation enabled

Bit 7 **TEST**: Test mode enable

0: Normal operation, register TEST holds reset values

1: Test mode, write access to register TEST enabled

Bit 6 **DAR**: Disable automatic retransmission

0: Automatic retransmission of messages not transmitted successfully enabled

1: Automatic retransmission disabled

Bit 5 **MON**: Bus monitoring mode

Bit MON can only be set by software when both CCE and INIT are set to 1. The bit can be reset by the user at any time.

0: Bus monitoring mode is disabled

1: Bus monitoring mode is enabled

Bit 4 **CSR**: Clock stop request

0: No clock stop is requested

1: Clock stop requested. When clock stop is requested, first INIT and then CSA is set after all pending transfer requests have been completed and the CAN bus reached idle.

Bit 3 **CSA**: Clock stop acknowledge

0: No clock stop acknowledged

1: FDCAN may be set in power down by stopping APB clock and kernel clock

Bit 2 **ASM**: ASM restricted operation mode

The restricted operation mode is intended for applications that adapt themselves to different CAN bitrates. The application tests different bitrates and leaves the restricted operation mode after it has received a valid frame. In the optional restricted operation mode the node is able to transmit and receive data and remote frames and it gives acknowledge to valid frames, but it does not send active error frames or overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The error counters are not incremented. Bit ASM can only be set by software when both CCE and INIT are set to 1. The bit can be reset by the software at any time. This bit is set automatically set to 1 when the Tx handler was not able to read data from the message RAM in time. If the FDCAN is connected to a clock calibration on CAN unit, ASM bit is set by hardware as long as the calibration is not completed.

0: Normal CAN operation

1: Restricted operation mode active

Bit 1 **CCE**: Configuration change enable

0: The CPU has no write access to the protected configuration registers

1: The CPU has write access to the protected configuration registers (while FDCAN\_CCCR.INIT = 1 CCE bit is automatically cleared when INIT bit is cleared)

Bit 0 **INIT**: Initialization

0: Normal operation

1: Initialization is started (while FDCAN\_CCCR.INIT = 1 CCE bit is automatically cleared when INIT bit is cleared)

*Note:* Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to INIT can be read back. Therefore the programmer must ensure that the previous value written to INIT has been accepted by reading INIT before setting INIT to a new value.

### 61.5.7 FDCAN nominal bit timing and prescaler register (FDCAN\_NBTP)

Address offset: 0x001C

Reset value: 0x0600 0A03

This register is dedicated to the nominal bit timing used during the arbitration phase, and is only writable if bits FDCAN\_CCCR.CCE and FDCAN\_CCCR.INIT are set. The CAN bit time may be programmed in the range of 4 to 81 tq. The CAN time quantum may be programmed in the range of [1 ... 1024] FDCAN kernel clock periods.

$tq = (BRP + 1) \text{ FDCAN clock period } fdcan\_tq\_ck$

NTSEG1 is the sum of Prop\_Seg and Phase\_Seg1. NTSEG2 is Phase\_Seg2. Therefore the length of the bit time is (programmed values) [NTSEG1 + NTSEG2 + 3] tq or (functional values) [Sync\_Seg + Prop\_Seg + Phase\_Seg1 + Phase\_Seg2] tq.

The information processing time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
NSJW[6:0]							NBRP[8:0]								
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NTSEG1[7:0]								Res.	NTSEG2[6:0]						
rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw

Bits 31:25 **NSJW[6:0]**: Nominal (re)synchronization jump width  
 Should be smaller than NTSEG2, valid values are 0 to 127. The value used by the hardware is the one programmed, incremented by 1, i.e.  $t_{SJW} = (NSJW + 1) \times t_q$ .  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 24:16 **NBRP[8:0]**: Bitrate prescaler  
 Value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values are 0 to 511. The value used by the hardware is the one programmed, incremented by 1.  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 15:8 **NTSEG1[7:0]**: Nominal time segment before sample point  
 Valid values are 0 to 255. The value used by the hardware is the one programmed, incremented by 1 ( $t_{BS1} = (NTSEG1 + 1) \times t_q$ ).  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bit 7 Reserved, must be kept at reset value.

Bits 6:0 **NTSEG2[6:0]**: Nominal time segment after sample point  
 Valid values are 0 to 127. The value used by the hardware is the one programmed, incremented by 1 ( $t_{BS2} = (NTSEG2 + 1) \times t_q$ ).

*Note:* With a CAN kernel clock of 8 MHz, the reset value of 0x00000A33 configures the FDCAN for a bitrate of 125 kbit/s.

### 61.5.8 FDCAN timestamp counter configuration register (FDCAN\_TSCC)

Address offset: 0x0020

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TCP[3:0]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TSS[1:0]	
														rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **TCP[3:0]**: Timestamp counter prescaler  
 Configures the timestamp and timeout counters time unit in multiples of CAN bit times [1 ... 16]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.  
 In CAN FD mode the internal timestamp counter TCP does not provide a constant time base due to the different CAN bit times between arbitration phase and data phase. Thus CAN FD requires an external counter for timestamp generation (TSS = 10).  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 15:2 Reserved, must be kept at reset value.

Bits 1:0 **TSS[1:0]**: Timestamp select

- 00: Timestamp counter value always 0x0000
- 01: Timestamp counter value incremented according to TCP
- 10: External timestamp counter from TIM3 value used (tim3\_cnt[0:15])
- 11: Same as 00.

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

### 61.5.9 FDCAN timestamp counter value register (FDCAN\_TSCV)

Address offset: 0x0024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TSC[15:0]															
rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **TSC[15:0]**: Timestamp counter

The internal/external timestamp counter value is captured on start of frame (both Rx and Tx). When FDCAN\_TSCC.TSS = 01, the timestamp counter is incremented in multiples of CAN bit times [1 ... 16] depending on the configuration of FDCAN\_TSCC.TCP. A wrap around sets interrupt flag FDCAN\_IR.TSW. Write access resets the counter to 0. When FDCAN\_TSCC.TSS = 10, TSC reflects the external timestamp counter value. A write access has no impact.

*Note:* A “wrap around” is a change of the timestamp counter value from non-0 to 0 not caused by write access to FDCAN\_TSCV.

### 61.5.10 FDCAN timeout counter configuration register (FDCAN\_TOCC)

Address offset: 0x0028

Reset value: 0xFFFF 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TOP[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TOS[1:0]		ETOC
													rw	rw	rw

Bits 31:16 **TOP[15:0]**: Timeout period

Start value of the timeout counter (down-counter). Configures the timeout period. These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:1 **TOS[1:0]**: Timeout select

When operating in Continuous mode, a write to FDCAN\_TOCV presets the counter to the value configured by FDCAN\_TOCC.TOP and continues down-counting. When the timeout counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by FDCAN\_TOCC.TOP. Down-counting is started when the first FIFO element is stored.

- 00: Continuous operation
- 01: Timeout controlled by Tx event FIFO
- 10: Timeout controlled by Rx FIFO 0
- 11: Timeout controlled by Rx FIFO 1

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bit 0 **ETOC**: Enable timeout counter

- 0: Timeout counter disabled
- 1: Timeout counter enabled

This is a write-protected bit, write access is possible only when the bit 1 (CCE) and bit 0 (INIT) of FDCAN\_CCCR register are set to 1.

For more details see [Timeout counter](#).

### 61.5.11 FDCAN timeout counter value register (FDCAN\_TOCV)

Address offset: 0x002C

Reset value: 0x0000 FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TOC[15:0]															
rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w	rc_w

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **TOC[15:0]**: Timeout counter

The timeout counter is decremented in multiples of CAN bit times [1 ... 16] depending on the configuration of FDCAN\_TSCC.TCP. When decremented to 0, interrupt flag FDCAN\_IR.TOO is set and the timeout counter is stopped. Start and reset/restart conditions are configured via FDCAN\_TOCC.TOS.

### 61.5.12 FDCAN error counter register (FDCAN\_ECR)

Address offset: 0x0040

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CEL[7:0]							
								rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RP	REC[6:0]							TEC[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **CEL[7:0]**: CAN error logging

The counter is incremented each time when a CAN protocol error causes the transmit error counter or the receive error counter to be incremented. It is reset by read access to CEL. The counter stops at 0xFF; the next increment of TEC or REC sets interrupt flag FDCAN\_IR.ELO.

Bit 15 **RP**: Receive error passive

- 0: The receive error counter is below the error passive level of 128
- 1: The receive error counter has reached the error passive level of 128

Bits 14:8 **REC[6:0]**: Receive error counter

Actual state of the receive error counter, values between 0 and 127.

Bits 7:0 **TEC[7:0]**: Transmit error counter

Actual state of the transmit error counter, values between 0 and 255.

When FDCAN\_CCCR.ASM is set, the CAN protocol controller does not increment TEC and REC when a CAN protocol error is detected, but CEL is still incremented.

### 61.5.13 FDCAN protocol status register (FDCAN\_PSR)

Address offset: 0x0044

Reset value: 0x0000 0707

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TDCV[6:0]						
									r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	PXE	REDL	RBRS	RESI	DLEC[2:0]			BO	EW	EP	ACT[1:0]		LEC[2:0]		
	rc_r	rc_r	rc_r	rc_r	rs_r	rs_r	rs_r	r	r	r	r	r	rs_r	rs_r	rs_r

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:16 **TDCV[6:0]**: Transmitter delay compensation value

Position of the secondary sample point, defined by the sum of the measured delay from FDCAN\_TX to FDCAN\_RX and FDCAN\_TDCR.TDCO. The SSP position is, in the data phase, the number of minimum time quanta (mtq) between the start of the transmitted bit and the secondary sample point. Valid values are 0 to 127 mtq.

- Bit 15 Reserved, must be kept at reset value.
- Bit 14 **PXE**: Protocol exception event  
0: No protocol exception event occurred since last read access  
1: Protocol exception event occurred
- Bit 13 **REDL**: Received FDCAN message  
This bit is set independent of acceptance filtering.  
0: Since this bit was reset by the CPU, no FDCAN message has been received  
1: Message in FDCAN format with EDL flag set has been received  
Access type is RX: reset on read.
- Bit 12 **BRS**: BRS flag of last received FDCAN message  
This bit is set together with REDL, independent of acceptance filtering.  
0: Last received FDCAN message did not have its BRS flag set  
1: Last received FDCAN message had its BRS flag set  
Access type is RX: reset on read.
- Bit 11 **RESI**: ESI flag of last received FDCAN message  
This bit is set together with REDL, independent of acceptance filtering.  
0: Last received FDCAN message did not have its ESI flag set  
1: Last received FDCAN message had its ESI flag set  
Access type is RX: reset on read.
- Bits 10:8 **DLEC[2:0]**: Data last error code  
Type of last error that occurred in the data phase of a FDCAN format frame with its BRS flag set. Coding is the same as for LEC. This field is cleared to 0 when a FDCAN format frame with its BRS flag set has been transferred (reception or transmission) without error.  
Access type is RS: set on read.
- Bit 7 **BO**: Bus\_Off status  
0: The FDCAN is not Bus\_Off  
1: The FDCAN is in Bus\_Off state
- Bit 6 **EW**: Warning status  
0: Both error counters are below the Error\_Warning limit of 96  
1: At least one of error counter has reached the Error\_Warning limit of 96
- Bit 5 **EP**: Error passive  
0: The FDCAN is in the Error\_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected  
1: The FDCAN is in the Error\_Passive state
- Bits 4:3 **ACT[1:0]**: Activity  
Monitors the module CAN communication state.  
00: Synchronizing: node is synchronizing on CAN communication  
01: Idle: node is neither receiver nor transmitter  
10: Receiver: node is operating as receiver  
11: Transmitter: node is operating as transmitter

Bits 2:0 **LEC[2:0]**: Last error code

The LEC indicates the type of the last error to occur on the CAN bus. This field is cleared to 0 when a message has been transferred (reception or transmission) without error.

000: No error: No error occurred since LEC has been reset by successful reception or transmission.

001: Stuff error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed.

010: Form error: A fixed format part of a received frame has the wrong format.

011: AckError: The message transmitted by the FDCAN was not acknowledged by another node.

100: Bit1Error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value 1), but the monitored bus value was dominant.

101: Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device wanted to send a dominant level (data or identifier bit logical value 0), but the monitored bus value was recessive. During Bus\_Off recovery this status is set each time a sequence of 11 recessive bits has been monitored. This enables the CPU to monitor the proceeding of the Bus\_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed).

110: CRCError: The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match with the CRC calculated from the received data.

111: NoChange: Any read access to the protocol status register re-initializes the LEC to '7. When the LEC shows the value 7, no CAN bus event was detected since the last CPU read access to the protocol status register.

Access type is RS: set on read.

*Note:* When a frame in FDCAN format has reached the data phase with BRS flag set, the next CAN event (error or valid frame) is shown in FLEC instead of LEC. An error in a fixed stuff bit of a FDCAN CRC sequence is shown as a Form error, not Stuff error

*Note:* The Bus\_Off recovery sequence (see CAN Specification Rev. 2.0 or ISO11898-1) cannot be shortened by setting or resetting FDCAN\_CCCR.INIT. If the device goes Bus\_Off, it sets FDCAN\_CCCR.INIT of its own, stopping all bus activities. Once FDCAN\_CCCR.INIT has been cleared by the CPU, the device waits for 129 occurrences of bus Idle (129 × 11 consecutive recessive bits) before resuming normal operation. At the end of the Bus\_Off recovery sequence, the error management counters are reset. During the waiting time after the reset of FDCAN\_CCCR.INIT, each time a sequence of 11 recessive bits has been monitored, a Bit0 error code is written to FDCAN\_PSR.LEC, enabling the CPU to readily check up whether the CAN bus is stuck at dominant or continuously disturbed and to monitor the Bus\_Off recovery sequence. FDCAN\_ECR.REC is used to count these sequences.

### 61.5.14 FDCAN transmitter delay compensation register (FDCAN\_TDCR)

Address offset: 0x0048

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	TDCO[6:0]							Res.	TDCF[6:0]						
	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw

Bits 31:15 Reserved, must be kept at reset value.

Bits 14:8 **TDCO[6:0]**: Transmitter delay compensation offset

Offset value defining the distance between the measured delay from FDCAN\_TX to FDCAN\_RX and the secondary sample point. Valid values are 0 to 127 mtq.

These are write-protected bits, which means that write access by the bits is possible only when the bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bit 7 Reserved, must be kept at reset value.

Bits 6:0 **TDCF[6:0]**: Transmitter delay compensation filter window length

Defines the minimum value for the SSP position, dominant edges on FDCAN\_RX that would result in an earlier SSP position are ignored for transmitter delay measurements.

These are write-protected bits, which means that write access by the bits is possible only when the bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

### 61.5.15 FDCAN interrupt register (FDCAN\_IR)

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the user clears them. A flag is cleared by writing a 1 to the corresponding bit position.

Writing a 0 has no effect. A hard reset clears the register. The configuration of IE controls whether an interrupt is generated. The configuration of ILS controls on which interrupt line an interrupt is signaled.

Address offset: 0x0050

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **ARA**: Access to reserved address

- 0: No access to reserved address occurred
- 1: Access to reserved address occurred

Bit 28 **PED**: Protocol error in data phase (data bit time is used)

- 0: No protocol error in data phase
- 1: Protocol error in data phase detected (PSR.DLEC different from 0,7)

Bit 27 **PEA**: Protocol error in arbitration phase (nominal bit time is used)

- 0: No protocol error in arbitration phase
- 1: Protocol error in arbitration phase detected (PSR.LEC different from 0,7)

Bit 26 **WDI**: Watchdog interrupt

- 0: No message RAM watchdog event occurred
- 1: Message RAM watchdog event due to missing READY

- Bit 25 **BO**: Bus\_Off status  
0: Bus\_Off status unchanged  
1: Bus\_Off status changed
- Bit 24 **EW**: Warning status  
0: Error\_Warning status unchanged  
1: Error\_Warning status changed
- Bit 23 **EP**: Error passive  
0: Error\_Passive status unchanged  
1: Error\_Passive status changed
- Bit 22 **ELO**: Error logging overflow  
0: CAN error logging counter did not overflow  
1: Overflow of CAN error logging counter occurred
- Bits 21:20 Reserved, must be kept at reset value.
- Bit 19 **DRX**: Message stored to dedicated Rx buffer  
The flag is set whenever a received message has been stored into a dedicated Rx buffer.  
0: No Rx buffer updated  
1: At least one received message stored into a Rx buffer
- Bit 18 **TOO**: Timeout occurred  
0: No timeout  
1: Timeout reached
- Bit 17 **MRAF**: Message RAM access failure  
The flag is set when the Rx handler
- l Has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx handler starts processing of the following message.
  - l Was unable to write a message to the message RAM. In this case message storage is aborted. In both cases the FIFO put index is not updated or the New data flag for a dedicated Rx buffer is not set. The partly stored message is overwritten when the next message is stored to this location. The flag is also set when the Tx handler was not able to read a message from the message RAM in time. In this case message transmission is aborted. In case of a Tx handler access failure the FDCAN is switched into restricted operation mode (see [Restricted operation mode](#)). To leave restricted operation mode, the user has to reset FDCAN\_CCCR.ASM.
- 0: No message RAM access failure occurred  
1: Message RAM access failure occurred
- Bit 16 **TSW**: Timestamp wraparound  
0: No timestamp counter wraparound  
1: Timestamp counter wraparound
- Bit 15 **TEFL**: Tx event FIFO element lost  
0: No Tx event FIFO element lost  
1: Tx event FIFO element lost, also set after write attempt to Tx event FIFO of size 0
- Bit 14 **TEFF**: Tx event FIFO full  
0: Tx event FIFO not full  
1: Tx event FIFO full
- Bit 13 **TEFW**: Tx event FIFO watermark reached  
0: Tx event FIFO fill level below watermark  
1: Tx event FIFO fill level reached watermark

- Bit 12 **TEFN**: Tx event FIFO new entry  
0: Tx event FIFO unchanged  
1: Tx handler wrote Tx event FIFO element
- Bit 11 **TFE**: Tx FIFO empty  
0: Tx FIFO non-empty  
1: Tx FIFO empty
- Bit 10 **TCF**: Transmission cancellation finished  
0: No transmission cancellation finished  
1: Transmission cancellation finished
- Bit 9 **TC**: Transmission completed  
0: No transmission completed  
1: Transmission completed
- Bit 8 **HPM**: High priority message  
0: No high priority message received  
1: High priority message received
- Bit 7 **RF1L**: Rx FIFO 1 message lost  
0: No Rx FIFO 1 message lost  
1: Rx FIFO 1 message lost, also set after write attempt to Rx FIFO 1 of size 0
- Bit 6 **RF1F**: Rx FIFO 1 full  
0: Rx FIFO 1 not full  
1: Rx FIFO 1 full
- Bit 5 **RF1W**: Rx FIFO 1 watermark reached  
0: Rx FIFO 1 fill level below watermark  
1: Rx FIFO 1 fill level reached watermark
- Bit 4 **RF1N**: Rx FIFO 1 new message  
0: No new message written to Rx FIFO 1  
1: New message written to Rx FIFO 1
- Bit 3 **RF0L**: Rx FIFO 0 message lost  
0: No Rx FIFO 0 message lost  
1: Rx FIFO 0 message lost, also set after write attempt to Rx FIFO 0 of size 0
- Bit 2 **RF0F**: Rx FIFO 0 full  
0: Rx FIFO 0 not full  
1: Rx FIFO 0 full
- Bit 1 **RF0W**: Rx FIFO 0 watermark reached  
0: Rx FIFO 0 fill level below watermark  
1: Rx FIFO 0 fill level reached watermark
- Bit 0 **RF0N**: Rx FIFO 0 New message  
0: No new message written to Rx FIFO 0  
1: New message written to Rx FIFO 0

### 61.5.16 FDCAN interrupt enable register (FDCAN\_IE)

The settings in the interrupt enable register determine which status changes in the interrupt register is signaled on an interrupt line.

Address offset: 0x0054

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

 0: Interrupt disabled  
 1: Interrupt enabled
- Bit 0 **RF0NE**: Rx FIFO 0 new message interrupt enable  
 0: Interrupt disabled  
 1: Interrupt enabled

### 61.5.17 FDCAN interrupt line select register (FDCAN\_ILS)

This register assigns an interrupt generated by a specific interrupt flag from the interrupt register to one of the two module interrupt lines. For interrupt generation the respective interrupt line must be enabled via FDCAN\_ILE.EINT0 and FDCAN\_ILE.EINT1.

Address offset: 0x0058

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	ARAL	PEDL	PEAL	WDIL	BOL	EWL	EPL	ELOL	Res.	Res.	DRXL	TOOL	MRAFL	TSWL
		rW	rW	rW	rW	rW	rW	rW	rW			rW	rW	rW	rW

rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

Bits 31:30 Reserved, must be kept at reset value.

- Bit 29 **ARAL**: Access to reserved address line
- Bit 28 **PEDL**: Protocol error in data phase line
- Bit 27 **PEAL**: Protocol error in arbitration phase line
- Bit 26 **WDIL**: Watchdog interrupt line
- Bit 25 **BOL**: Bus\_Off status
- Bit 24 **EWL**: Warning status interrupt line
- Bit 23 **EPL**: Error passive interrupt line
- Bit 22 **ELOL**: Error logging overflow interrupt line

Bits 21:20 Reserved, must be kept at reset value.

- Bit 19 **DRXL**: Message stored to dedicated Rx buffer interrupt line
- Bit 18 **TOOL**: Timeout occurred interrupt line
- Bit 17 **MRAFL**: Message RAM access failure interrupt line
- Bit 16 **TSWL**: Timestamp wraparound interrupt line
- Bit 15 **TEFLL**: Tx event FIFO element Lost interrupt line
- Bit 14 **TEFFL**: Tx event FIFO full interrupt line

- Bit 13 **TEFWL**: Tx event FIFO watermark reached interrupt line
- Bit 12 **TEFNL**: Tx event FIFO new entry interrupt line
- Bit 11 **TFEL**: Tx FIFO empty interrupt line
- Bit 10 **TCFL**: Transmission cancellation finished interrupt line
- Bit 9 **TCL**: Transmission completed interrupt line
- Bit 8 **HPML**: High priority message interrupt line
- Bit 7 **RF1LL**: Rx FIFO 1 message lost interrupt line
- Bit 6 **RF1FL**: Rx FIFO 1 full interrupt line
- Bit 5 **RF1WL**: Rx FIFO 1 watermark reached interrupt line
- Bit 4 **RF1NL**: Rx FIFO 1 new message interrupt line
- Bit 3 **RF0LL**: Rx FIFO 0 message lost interrupt line
- Bit 2 **RF0FL**: Rx FIFO 0 full interrupt line
- Bit 1 **RF0WL**: Rx FIFO 0 watermark reached interrupt line
- Bit 0 **RF0NL**: Rx FIFO 0 new message interrupt line

**61.5.18 FDCAN interrupt line enable register (FDCAN\_ILE)**

Each of the two interrupt lines to the CPU can be enabled/disabled separately by programming bits EINT0 and EINT1.

Address offset: 0x005C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

- Bit 1 **EINT1**: Enable interrupt line 1
  - 0: Interrupt line fdcan\_intr1\_it disabled
  - 1: Interrupt line fdcan\_intr1\_it enabled
- Bit 0 **EINT0**: Enable interrupt line 0
  - 0: Interrupt line fdcan\_intr0\_it disabled
  - 1: Interrupt line fdcan\_intr0\_it enabled

### 61.5.19 FDCAN global filter configuration register (FDCAN\_GFC)

Global settings for message ID filtering. The global filter configuration register controls the filter path for standard and extended messages as described in *Figure 708* and *Figure 709*.

Address offset: 0x0080

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ANFS[1:0]		ANFE[1:0]		RRFS	RRFE
											rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:4 **ANFS[1:0]**: Accept non-matching frames standard

Defines how received messages with 11-bit ID that do not match any element of the filter list are treated.

00: Accept in Rx FIFO 0

01: Accept in Rx FIFO 1

10: Reject

11: Reject

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 3:2 **ANFE[1:0]**: Accept non-matching frames extended

Defines how received messages with 29-bit ID that do not match any element of the filter list are treated.

00: Accept in Rx FIFO 0

01: Accept in Rx FIFO 1

10: Reject

11: Reject

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bit 1 **RRFS**: Reject remote frames standard

0: Filter remote frames with 11-bit standard ID

1: Reject all remote frames with 11-bit standard ID

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bit 0 **RRFE**: Reject remote frames extended

0: Filter remote frames with 29-bit standard ID

1: Reject all remote frames with 29-bit standard ID

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

### 61.5.20 FDCAN standard ID filter configuration register (FDCAN\_SIDFC)

Settings for 11-bit standard message ID filtering. The standard ID filter configuration register controls the filter path for standard messages as described in [Figure 708](#).

Address offset: 0x0084

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LSS[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FLSSA[13:0]														Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **LSS[7:0]**: List size standard

0: No standard message ID filter

1-128: Number of standard message ID filter elements

>128: Values greater than 128 are interpreted as 128.

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 15:2 **FLSSA[13:0]**: Filter list standard start address

Start address of standard message ID filter list (32-bit word address, see [Table 489](#)). These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 1:0 Reserved, must be kept at reset value.

### 61.5.21 FDCAN extended ID filter configuration register (FDCAN\_XIDFC)

Settings for 29-bit extended message ID filtering. The FDCAN extended ID filter configuration register controls the filter path for standard messages as described in [Figure 709](#).

Address offset: 0x0088

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LSE[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FLESA[13:0]														Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		

Bits 31:24 Reserved, must be kept at reset value.

- Bits 23:16 **LSE[7:0]**: List size extended
  - 0: No extended message ID filter
  - 1-128: Number of extended ID filter elements
  - >128: Values greater than 128 are interpreted as 128.
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.
- Bits 15:2 **FLESA[13:0]**: Filter list extended start address
  - Start address of extended message ID filter list (32-bit word address, see [Table 491: Extended message ID filter element](#)).
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.
- Bits 1:0 Reserved, must be kept at reset value.

### 61.5.22 FDCAN extended ID and mask register (FDCAN\_XIDAM)

Address offset: 0x0090  
 Reset value: 0x1FFF FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	EIDM[28:16]												
			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EIDM[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

- Bits 31:29 Reserved, must be kept at reset value.
- Bits 28:0 **EIDM[28:0]**: Extended ID Mask
  - For acceptance filtering of extended frames the extended ID AND Mask is AND-ed with the message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to 1 the mask is not active.
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

### 61.5.23 FDCAN high priority message status register (FDCAN\_HPMS)

This register is updated every time a message ID filter element configured to generate a priority event match. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

Address offset: 0x0094

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FLST	FIDX[6:0]						MSI[1:0]		BIDX[5:0]						
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **FLST**: Filter list

Indicates the filter list of the matching filter element.

0: Standard filter list

1: Extended filter list

Bits 14:8 **FIDX[6:0]**: Filter index

Index of matching filter element. Range is 0 to FDCAN\_SIDFC[LSS] - 1 or FDCAN\_XIDFC[LSE] - 1.

Bits 7:6 **MSI[1:0]**: Message storage indicator

00: No FIFO selected

01: FIFO overrun

10: Message stored in FIFO 0

11: Message stored in FIFO 1

Bits 5:0 **BIDX[5:0]**: Buffer index

Index of Rx FIFO element to which the message was stored. Only valid when MSI[1] = 1.

### 61.5.24 FDCAN new data 1 register (FDCAN\_NDAT1)

Address offset: 0x0098

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ND31	ND30	ND29	ND28	ND27	ND26	ND25	ND24	ND23	ND22	ND21	ND20	ND19	ND18	ND17	ND16
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ND15	ND14	ND13	ND12	ND11	ND10	ND9	ND8	ND7	ND6	ND5	ND4	ND3	ND2	ND1	ND0
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

Bits 31:0 **ND[31:0]**: New data[31:0]

The register holds the new data flags of Rx buffers 0 to 31. The flags are set when the respective Rx buffer has been updated from a received frame. The flags remain set until the user clears them. A flag is cleared by writing a 1 to the corresponding bit position. Writing a 0 has no effect. A hard reset clears the register.

- 0: Rx buffer not updated
- 1: Rx buffer updated from new message

### 61.5.25 FDCAN new data 2 register (FDCAN\_NDAT2)

Address offset: 0x009C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ND63	ND62	ND61	ND60	ND59	ND58	ND57	ND56	ND55	ND54	ND53	ND52	ND51	ND50	ND49	ND48
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ND47	ND46	ND45	ND44	ND43	ND42	ND41	ND40	ND39	ND38	ND37	ND36	ND35	ND34	ND33	ND32
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:0 **ND[63:32]**: New data[63:32]

The register holds the new data flags of Rx buffers 32 to 63. The flags are set when the respective Rx buffer has been updated from a received frame. The flags remain set until the user clears them. A flag is cleared by writing a 1 to the corresponding bit position. Writing a 0 has no effect. A hard reset clears clear the register.

- 0: Rx buffer not updated
- 1: Rx buffer updated from new message

### 61.5.26 FDCAN Rx FIFO 0 configuration register (FDCAN\_RXF0C)

Address offset: 0x00A0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
F0OM	F0WM[6:0]							Res.	F0S[6:0]						
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w		r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
F0SA[13:0]													Res.	Res.	
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w		

Bit 31 **F0OM**: FIFO 0 operation mode

FIFO 0 can be operated in blocking or in overwrite mode.

- 0: FIFO 0 blocking mode
- 1: FIFO 0 overwrite mode

- Bits 30:24 **F0WM[6:0]**: FIFO 0 watermark
  - 0: Watermark interrupt disabled
  - 1-64: Level for Rx FIFO 0 watermark interrupt (FDCAN\_IR.RF0W)
  - >64: Watermark interrupt disabled
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.
- Bit 23 Reserved, must be kept at reset value.
- Bits 22:16 **F0S[6:0]**: Rx FIFO 0 size
  - 0: No Rx FIFO 0
  - 1-64: Number of Rx FIFO 0 elements
  - >64: Values greater than 64 are interpreted as 64
 The Rx FIFO 0 elements are indexed from 0 to F0S-1.
- Bits 15:2 **F0SA[13:0]**: Rx FIFO 0 start address
  - Start address of Rx FIFO 0 in message RAM (32-bit word address, see [Figure 707](#)).
- Bits 1:0 Reserved, must be kept at reset value.

### 61.5.27 FDCAN Rx FIFO 0 status register (FDCAN\_RXF0S)

Address offset: 0x00A4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	RF0L	F0F	Res.	Res.	F0PI[5:0]					
						rw	rw			rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	F0GI[5:0]						Res.	F0FL[6:0]						
		rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw

- Bits 31:26 Reserved, must be kept at reset value.
- Bit 25 **RF0L**: Rx FIFO 0 message lost
  - This bit is a copy of interrupt flag FDCAN\_IR.RF0L. When FDCAN\_IR.RF0L is reset, this bit is also reset.
  - 0: No Rx FIFO 0 message lost
  - 1: Rx FIFO 0 message lost, also set after write attempt to Rx FIFO 0 of size 0
- Bit 24 **F0F**: Rx FIFO 0 full
  - 0: Rx FIFO 0 not full
  - 1: Rx FIFO 0 full
- Bits 23:22 Reserved, must be kept at reset value.
- Bits 21:16 **F0PI[5:0]**: Rx FIFO 0 put index
  - Rx FIFO 0 write index pointer, range 0 to 63.
- Bits 15:14 Reserved, must be kept at reset value.
- Bits 13:8 **F0GI[5:0]**: Rx FIFO 0 get index
  - Rx FIFO 0 read index pointer, range 0 to 63.
- Bit 7 Reserved, must be kept at reset value.

Bits 6:0 **F0FL**[6:0]: Rx FIFO 0 fill level  
 Number of elements stored in Rx FIFO 0, range 0 to 64.

**61.5.28 FDCAN Rx FIFO 0 acknowledge register (FDCAN\_RXF0A)**

Address offset: 0x00A8  
 Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	F0AI[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **F0AI**[5:0]: Rx FIFO 0 acknowledge index  
 After the user has read a message or a sequence of messages from Rx FIFO 0 it has to write the buffer index of the last element read from Rx FIFO 0 to F0AI. This sets the Rx FIFO 0 get index FDCAN\_RXF0S.F0GI to F0AI + 1 and update the FIFO 0 fill level FDCAN\_RXF0S.F0FL.

**61.5.29 FDCAN Rx buffer configuration register (FDCAN\_RXBC)**

Address offset: 0x00AC  
 Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RBSA[13:0]														Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:2 **RBSA**[13:0]: Rx buffer start address  
 Configures the start address of the Rx buffers section in the message RAM (32-bit word address). Also used to reference debug messages A, B, C.  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 1:0 Reserved, must be kept at reset value.

### 61.5.30 FDCAN Rx FIFO 1 configuration register (FDCAN\_RXF1C)

Address offset: 0x00B0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
F1OM	F1WM[6:0]							Res.	F1S[6:0]						
rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
F1SA[13:0]													Res.	Res.	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		

Bit 31 **F1OM**: FIFO 1 operation mode

FIFO 1 can be operated in blocking or in overwrite mode.

0: FIFO 1 blocking mode

1: FIFO 1 overwrite mode

Bits 30:24 **F1WM[6:0]**: Rx FIFO 1 watermark

0: Watermark interrupt disabled

1-64: Level for Rx FIFO 1 watermark interrupt (FDCAN\_IR.RF1W)

>64: Watermark interrupt disabled.

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bit 23 Reserved, must be kept at reset value.

Bits 22:16 **F1S[6:0]**: Rx FIFO 1 size

0: No Rx FIFO 1

1-64: Number of Rx FIFO 1 elements

>64: Values greater than 64 are interpreted as 64

The Rx FIFO 1 elements are indexed from 0 to F1S - 1.

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 15:2 **F1SA[13:0]**: Rx FIFO 1 start address

start address of Rx FIFO 1 in message RAM (32-bit word address, see [Figure 707](#)).

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 1:0 Reserved, must be kept at reset value.

### 61.5.31 FDCAN Rx FIFO 1 status register (FDCAN\_RXF1S)

Address offset: 0x00B4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DMS[1:0]		Res.	Res.	Res.	Res.	RF1L	F1F	Res.	Res.	F1PI[5:0]					
r	r					r	r			r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	F1GI[5:0]						Res.	F1FL[6:0]						
		r	r	r	r	r	r		r	r	r	r	r	r	r

Bits 31:30 **DMS[1:0]**: Debug message status  
 00: Idle state, wait for reception of debug messages  
 01: Debug message A received  
 10: Debug messages A, B received  
 11: Debug messages A, B, C received

Bits 29:26 Reserved, must be kept at reset value.

Bit 25 **RF1L**: Rx FIFO 1 message lost  
 This bit is a copy of interrupt flag FDCAN\_IR.RF1L. When FDCAN\_IR.RF1L is reset, this bit is also reset.  
 0: No Rx FIFO 1 message lost  
 1: Rx FIFO 1 message lost, also set after write attempt to Rx FIFO 1 of size 0.

Bit 24 **F1F**: Rx FIFO 1 full  
 0: Rx FIFO 1 not full  
 1: Rx FIFO 1 full

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **F1PI[5:0]**: Rx FIFO 1 put index  
 Rx FIFO 1 write index pointer, range 0 to 63.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **F1GI[5:0]**: Rx FIFO 1 get index  
 Rx FIFO 1 read index pointer, range 0 to 63.

Bit 7 Reserved, must be kept at reset value.

Bits 6:0 **F1FL[6:0]**: Rx FIFO 1 fill level  
 Number of elements stored in Rx FIFO 1, range 0 to 64

### 61.5.32 FDCAN Rx FIFO 1 acknowledge register (FDCAN\_RXF1A)

Address offset: 0x00B8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	F1AI[5:0]					
										r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **F1AI[5:0]**: Rx FIFO 1 acknowledge index

After the user has read a message or a sequence of messages from Rx FIFO 1 it has to write the buffer index of the last element read from Rx FIFO 1 to F1AI. This sets the Rx FIFO 1 get index FDCAN\_RXF1S.F1GI. to F1AI + 1 and update the FIFO 1 fill level FDCAN\_RXF1S.F1FL.

### 61.5.33 FDCAN Rx buffer element size configuration register (FDCAN\_RXESC)

Configures the number of data bytes belonging to an Rx buffer / Rx FIFO element. Data field sizes higher than 8 bytes are intended for CAN FD operation only.

Address offset: 0x00BC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	RBDS[2:0]			Res.	F1DS[2:0]			Res.	F0DS[2:0]		
					r	r	r		r	r	r		r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:8 **RBDS[2:0]**: Rx buffer data field size

- 000: 8-byte data field
- 001: 12-byte data field
- 010: 16-byte data field
- 011: 20-byte data field
- 100: 24-byte data field
- 101: 32-byte data field
- 110: 48-byte data field
- 111: 64-byte data field

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **F1DS[2:0]**: Rx FIFO 0 data field size

- 000: 8-byte data field
- 001: 12-byte data field
- 010: 16-byte data field
- 011: 20-byte data field
- 100: 24-byte data field
- 101: 32-byte data field
- 110: 48-byte data field
- 111: 64-byte data field

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **F0DS[2:0]**: Rx FIFO 1 data field size

- 000: 8-byte data field
- 001: 12-byte data field
- 010: 16-byte data field
- 011: 20-byte data field
- 100: 24-byte data field
- 101: 32-byte data field
- 110: 48-byte data field
- 111: 64-byte data field

### 61.5.34 FDCAN Tx buffer configuration register (FDCAN\_TXBC)

Address offset: 0x00C0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	TFQM	TFQS[5:0]						Res.	Res.	NDTB[5:0]					
	rw	rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TBSA[13:0]														Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		

Bit 31 Reserved, must be kept at reset value.

Bit 30 **TFQM**: Tx FIFO/queue mode

- 0: Tx FIFO operation
- 1: Tx queue operation.

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 29:24 **TFQS[5:0]**: Transmit FIFO/queue size

- 0: No Tx FIFO/queue
- 1-32: Number of Tx buffers used for Tx FIFO/queue
- >32: Values greater than 32 are interpreted as 32.

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **NDTB[5:0]**: Number of dedicated transmit buffers  
 0: No dedicated Tx buffers  
 1-32: Number of dedicated Tx buffers  
 >32: Values greater than 32 are interpreted as 32.  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 15:2 **TBSA[13:0]**: Tx buffers start address  
 Start address of Tx buffers section in message RAM (32-bit word address, see [Figure 707](#)).  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 1:0 Reserved, must be kept at reset value.

*Note:* The sum of TFQS and NDTB cannot be larger than 32. There is no check for erroneous configurations. The Tx buffers section in the message RAM starts with the dedicated Tx buffers.

### 61.5.35 FDCAN Tx FIFO/queue status register (FDCAN\_TXFQS)

The Tx FIFO/queue status is related to the pending Tx requests listed in register FDCAN\_TXBRP. Therefore the effect of add/cancellation requests may be delayed due to a running Tx scan (FDCAN\_TXBRP not yet updated).

Address offset: 0x00C4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TFQF	TFQPI[4:0]				
										r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	TFGI[4:0]					Res.	Res.	TFFL[5:0]					
			r	r	r	r	r			r	r	r	r	r	r

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **TFQF**: Tx FIFO/queue full  
 0 Tx FIFO/queue not full  
 1 Tx FIFO/queue full

Bits 20:16 **TFQPI[4:0]**: Tx FIFO/queue put index  
 Tx FIFO/queue write index pointer, range 0 to 31

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **TFGI[4:0]**:  
 Tx FIFO get index.  
 Tx FIFO read index pointer, range 0 to 31. Read as 0 when Tx queue operation is configured (FDCAN\_TXBC.TFQM = 1)

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **TFFL[5:0]**: Tx FIFO free level

Number of consecutive free Tx FIFO elements starting from TFGI, range 0 to 32. Read as 0 when Tx queue operation is configured (FDCAN\_TXBC.TFQM = 1).

*Note:* In case of mixed configurations where dedicated Tx buffers are combined with a Tx FIFO or a Tx queue, the put and get index indicate the number of the Tx buffer starting with the first dedicated Tx buffers. For example: For a configuration of 12 dedicated Tx buffers and a Tx FIFO of 20 buffers a put index of 15 points to the fourth buffer of the Tx FIFO.

### 61.5.36 FDCAN Tx buffer element size configuration register (FDCAN\_TXESC)

Configures the number of data bytes belonging to a Tx buffer element. Data field sizes >8 bytes are intended for CAN FD operation only.

Address offset: 0x00C8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TBDS[2:0]		
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **TBDS[2:0]**: Tx buffer data Field size:

- 000: 8-byte data field
- 001: 12-byte data field
- 010: 16-byte data field
- 011: 20-byte data field
- 100: 24-byte data field
- 101: 32-byte data field
- 110: 48-byte data field
- 111: 64-byte data field

### 61.5.37 FDCAN Tx buffer request pending register (FDCAN\_TXBRP)

Address offset: 0x00CC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TRP[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRP[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TRP[31:0]**:Transmission request pending

Each Tx buffer has its own transmission request pending bit. The bits are set via register FDCAN\_TXBAR. The bits are reset after a requested transmission has completed or has been canceled via register FDCAN\_TXBCR.

FDCAN\_TXBRP bits are set only for those Tx buffers configured via FDCAN\_TXBC. After a FDCAN\_TXBRP bit has been set, a Tx scan (see [Filtering for Debug messages](#)) is started to check for the pending Tx request with the highest priority (Tx buffer with lowest message ID).

A cancellation request resets the corresponding transmission request pending bit of register FDCAN\_TXBRP. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding FDCAN\_TXBRP bit has been reset.

After a cancellation has been requested, a finished cancellation is signaled via FDCAN\_TXBCF after successful transmission together with the corresponding FDCAN\_TXBTO bit when the transmission has not yet been started at the point of cancellation when the transmission has been aborted due to lost arbitration when an error occurred during frame transmission

In DAR mode all transmissions are automatically canceled if they are not successful. The corresponding FDCAN\_TXBCF bit is set for all unsuccessful transmissions.

0: No transmission request pending

1: Transmission request pending

*Note: FDCAN\_TXBRP bits set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx buffer, this add request is canceled immediately, the corresponding FDCAN\_TXBRP bit is reset.*

### 61.5.38 FDCAN Tx buffer add request register (FDCAN\_TXBAR)

Address offset: 0x00D0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
AR[31:16]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
AR[15:0]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:0 **AR[31:0]**:Add request

Each Tx buffer has its own add request bit. Writing a 1 sets the corresponding add request bit; writing a 0 has no impact. This enables the user to set transmission requests for multiple Tx buffers with one write to FDCAN\_TXBAR. FDCAN\_TXBAR bits are set only for those Tx buffers configured via FDCAN\_TXBC. When no Tx scan is running, the bits are reset immediately, else the bits remain set until the Tx scan process has completed.

0: No transmission request added

1: Transmission requested added.

*Note: If an add request is applied for a Tx buffer with pending transmission request (corresponding FDCAN\_TXBRP bit already set), the request is ignored.*

### 61.5.39 FDCAN Tx buffer cancellation request register (FDCAN\_TXBCR)

Address offset: 0x00D4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CR[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CR[31:0]**: Cancellation request

Each Tx buffer has its own cancellation request bit. Writing a 1 sets the corresponding cancellation request bit; writing a 0 has no impact.

This enables the user to set cancellation requests for multiple Tx buffers with one write to FDCAN\_TXBCR. FDCAN\_TXBCR bits are set only for those Tx buffers configured via FDCAN\_TXBC. The bits remain set until the corresponding FDCAN\_TXBRP bit is reset.

0: No cancellation pending

1: Cancellation pending

### 61.5.40 FDCAN Tx buffer transmission occurred register (FDCAN\_TXBTO)

Address offset: 0x00D8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TO[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TO[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TO[31:0]**: Transmission occurred

Each Tx buffer has its own transmission occurred bit. The bits are set when the corresponding FDCAN\_TXBRP bit is cleared after a successful transmission. The bits are reset when a new transmission is requested by writing a 1 to the corresponding bit of register FDCAN\_TXBAR.

0: No transmission occurred

1: Transmission occurred

### 61.5.41 FDCAN Tx buffer cancellation finished register (FDCAN\_TXBCF)

Address offset: 0x00DC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CF[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CF[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **CF[31:0]**: Cancellation finished

Each Tx buffer has its own cancellation finished bit. The bits are set when the corresponding FDCAN\_TXBRP bit is cleared after a cancellation was requested via FDCAN\_TXBCR. In case the corresponding FDCAN\_TXBRP bit was not set at the point of cancellation, CF is set immediately. The bits are reset when a new transmission is requested by writing a 1 to the corresponding bit of register FDCAN\_TXBAR.

- 0: No transmit buffer cancellation
- 1: Transmit buffer cancellation finished

### 61.5.42 FDCAN Tx buffer transmission interrupt enable register (FDCAN\_TXBTIE)

Address offset: 0x00E0

Reset value: 0x0000 0000

TIE[15:0]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

Bits 31:0 **TIE[31:0]**: Transmission interrupt enable

Each Tx buffer has its own transmission interrupt enable bit.

- 0: Transmission interrupt disabled
- 1: Transmission interrupt enable

### 61.5.43 FDCAN Tx buffer cancellation finished interrupt enable register (FDCAN\_TXBCIE)

Address offset: 0x00E4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CFIE[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CFIE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CFIE[31:0]**: Cancellation finished interrupt enable  
 Each Tx buffer has its own cancellation finished interrupt enable bit.  
 0: Cancellation finished interrupt disabled  
 1: Cancellation finished interrupt enabled

### 61.5.44 FDCAN Tx event FIFO configuration register (FDCAN\_TXEFC)

Address offset: 0x00F0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	EFWM[5:0]						Res.	Res.	EFS[5:0]					
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EFSA[13:0]														Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:24 **EFWM[5:0]**: Event FIFO watermark  
 0: Watermark interrupt disabled  
 1-32: Level for Tx event FIFO watermark interrupt (FDCAN\_IR.TEFW)  
 >32: Watermark interrupt disabled  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **EFS[5:0]**: Event FIFO size.  
 0: Tx event FIFO disabled  
 1-32: Number of Tx event FIFO elements  
 >32: Values greater than 32 are interpreted as 32  
 The Tx event FIFO elements are indexed from 0 to EFS-1.  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 15:2 **EFSA[13:0]**: Event FIFO start address

Start address of Tx event FIFO in message RAM (32-bit word address, see [Figure 707](#)).

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 1:0 Reserved, must be kept at reset value.

### 61.5.45 FDCAN Tx event FIFO status register (FDCAN\_TXEFS)

Address offset: 0x00F4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	TEFL	EFF	Res.	Res.	Res.	EFPI[4:0]				
						r	r				r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	EFGI[4:0]				Res.	Res.	EFFL[5:0]						
			r	r	r	r	r			r	r	r	r	r	r

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **TEFL**: Tx event FIFO element lost

This bit is a copy of interrupt flag FDCAN\_IR.TEFL. When FDCAN\_IR.TEFL is reset, this bit is also reset.

0 No Tx event FIFO element lost

1 Tx event FIFO element lost, also set after write attempt to Tx event FIFO of size 0.

Bit 24 **EFF**: Event FIFO full

0: Tx event FIFO not full

1: Tx event FIFO full

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **EFPI[4:0]**: Event FIFO put index

Tx event FIFO write index pointer, range 0 to 31.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **EFGI[4:0]**: Event FIFO get index

Tx event FIFO read index pointer, range 0 to 31.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **EFFL[5:0]**: Event FIFO fill level

Number of elements stored in Tx event FIFO, range 0 to 31.

### 61.5.46 FDCAN Tx event FIFO acknowledge register (FDCAN\_TXEFA)

Address offset: 0x00F8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EFAI[4:0]					
												rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **EFAI[4:0]**: Event FIFO acknowledge index

After the user has read an element or a sequence of elements from the Tx event FIFO, it must write the index of the last element read from Tx event FIFO to EFAI. This sets the Tx event FIFO get index FDCAN\_TXEFS.EFGI to EFAI + 1 and update the FIFO 0 fill level FDCAN\_TXEFS.EFFL.

### 61.5.47 FDCAN register map and reset values

Refer to [Section 2.3](#) for the register boundary addresses.

## 61.6 TTCAN registers

These registers are available only for FDCAN1.

### 61.6.1 FDCAN TT trigger memory configuration register (FDCAN\_TTTMC)

Address offset: 0x100

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TME[6:0]						
									rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TMSA[13:0]														Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:16 **TME[6:0]**: Trigger memory elements

0: No trigger memory

1-64: Number of trigger memory elements

>64: Values greater than 64 are interpreted as 64

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 15:2 **TMSA[13:0]**: Trigger memory start address.

Start address of trigger memory in message RAM (32-bit word address, see [Figure 707](#)).

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 1:0 Reserved, must be kept at reset value.

### 61.6.2 FDCAN TT reference message configuration register (FDCAN\_TTRMC)

Address offset: 0x0104

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RMPS	XTD	Res.	RID[28:16]												
rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RID[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

- Bit 31 **RMPS**: Reference message payload select  
 Ignored in case of time slaves.  
 0: Reference message has no additional payload  
 1: The following elements are taken from Tx buffer 0:
  - Message marker MM,
  - Event FIFO control EFC,
  - Data length code DLC,
  - Data Bytes DB (level 1: bytes 2-8, level 0, 2: bytes 5-8)
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.
  
- Bit 30 **XTD**: Extended identifier  
 0: 11-bit standard identifier  
 1: 29-bit extended identifier  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.
  
- Bit 29 Reserved, must be kept at reset value.
  
- Bits 28:0 **RID[28:0]**: Reference identifier.  
 Identifier transmitted with reference message and used for reference message filtering. Standard or extended reference identifier depending on bit XTD. A standard identifier must be written to ID[28:18].  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

### 61.6.3 FDCAN TT operation configuration register (FDCAN\_TTOCF)

Address offset: 0x0108

Reset value: 0x0001 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
Res.	Res.	Res.	Res.	Res.	EVTP	ECC	EGTF	AWL[7:0]									
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
EECS		IRTO[6:0]						LSDSL[2:0]			TM	GEN	Res.	OM[1:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw		

- Bits 31:27 Reserved, must be kept at reset value.
  
- Bit 26 **EVTP**: Event trigger polarity.  
 0: Rising edge trigger  
 1: Falling edge trigger  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.
  
- Bit 25 **ECC**: Enable clock calibration.  
 0: Automatic clock calibration in FDCAN level 0, 2 is disabled  
 1: Automatic clock calibration in FDCAN level 0, 2 is enabled  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

- Bit 24 **EGTF**: Enable global time filtering.  
0: Global time filtering in FDCAN level 0, 2 is disabled  
1: Global time filtering in FDCAN level 0, 2 is enabled  
These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.
- Bits 23:16 **AWL[7:0]**: Application watchdog limit.  
The application watchdog can be disabled by programming AWL to 0x00.  
0x00 to FF: Maximum time after which the application has to serve the application watchdog. The application watchdog is incremented once each 256 NTUs.  
These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.
- Bit 15 **EECS**: Enable external clock synchronization  
If enabled, TUR configuration (FDCAN\_TURCF.NCL only) may be updated during FDCAN operation.  
0: External clock synchronization in FDCAN level 0, 2 disabled  
1: External clock synchronization in FDCAN level 0, 2 enabled  
These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.
- Bits 14:8 **IRTO[6:0]**: Initial reference trigger offset.  
0x00 to 7F Positive offset, range from 0 to 127  
These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.
- Bits 7:5 **LSDSL[2:0]**: LD of synchronization deviation limit.  
The synchronization deviation limit SDL is configured by its dual logarithm LSDSL with  $SDL = 2 * (LSDSL + 5)$ . SDL is comprised between 32 and 4096. It should not exceed the clock tolerance given by the CAN bit timing configuration.  
These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.
- Bit 4 **TM**: Time master.  
0: Time master function disabled  
1: Potential time master  
These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.
- Bit 3 **GEN**: Gap enable.  
0: Strictly time-triggered operation  
1: External event-synchronized time-triggered operation  
These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.
- Bit 2 Reserved, must be kept at reset value.
- Bits 1:0 **OM[1:0]**: Operation mode.  
00: Event-driven CAN communication, default  
01: TTCAN level 1  
10: TTCAN level 2  
11: TTCAN level 0  
These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

### 61.6.4 FDCAN TT matrix limits register (FDCAN\_TTMLM)

Address offset: 0x010C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	ENTT[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	TXEW[3:0]				CSS[1:0]		CCM[5:0]					
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **ENTT[11:0]**: Expected number of Tx triggers  
 0x000 to FFF Expected number of Tx triggers in one matrix cycle.  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **TXEW[3:0]**: Tx enable window  
 0x0 to F Length of Tx enable window, 1-16 NTU cycles  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 7:6 **CSS[1:0]**: Cycle start synchronization  
 Enables sync pulse output.  
 00: No sync pulse  
 01: Sync pulse at start of basic cycle  
 10: Sync pulse at start of matrix cycle  
 11: Reserved  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 5:0 **CCM[5:0]**: Cycle count Max  
 0x00: 1 basic cycle per matrix cycle  
 0x01: 2 basic cycles per matrix cycle  
 0x03: 4 basic cycles per matrix cycle  
 0x07: 8 basic cycles per matrix cycle  
 0x0F: 16 basic cycles per matrix cycle  
 0x1F: 32 basic cycles per matrix cycle  
 0x3F: 64 basic cycles per matrix cycle  
 Others: Reserved  
 These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

*Note:* ISO 11898-4, Section 5.2.1 requires that only the listed cycle count values are configured. Other values are possible, but may lead to inconsistent matrix cycles.

### 61.6.5 FDCAN TUR configuration register (FDCAN\_TURCF)

The length of the NTU is given by:  $NTU = CAN \text{ clock period} \times NC/DC$ .

NC is an 18-bit value. Its high part, NCH[17:16] is hard wired to 0b01. Therefore the range of NC extends from 0x10000 to 0x1FFFF. The value configured by NCL is the initial value for FDCAN\_TURN.ANV[15:0]. DC is set to 0x1000 by hardware reset and it may not be written to 0x0000.

- Level 1:  $NC \times 4$  and  $NTU = CAN \text{ bit time}$
- Levels 0 and 2:  $NC \times 8$

The actual value of FDCAN\_TUR may be changed by the clock drift compensation function of TTCAN level 0 and level 2 in order to adjust the node local view of the NTU to the time master view of the NTU. DC is not changed by the automatic drift compensation, FDCAN\_TURN.ANV may be adjusted around NC in the range of the synchronization deviation limit given by FDCAN\_TTOCF.LDSDL. NC and DC should be programmed to the largest suitable values in achieve the best computational accuracy for the drift compensation process.

Address offset: 0x0110

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ELT	Res.	DC[13:0]													
rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NCL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **ELT**: Enable local time.

- 0: Local time is stopped, default
- 1: Local time is enabled

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

*Note: The local time is started by setting ELT, it remains active until ELT is reset or until the next hardware reset. FDCAN\_TURCF.DC is locked when FDCAN\_TURCF.ELT = 1. If ELT is written to 0, the readable value stays at 1 until the new value has been synchronized into the CAN clock domain. During this time write access to the other bits of the register is locked.*

Bit 30 Reserved, must be kept at reset value.

Bits 29:16 **DC[13:0]**: Denominator configuration.

- 0x0000: Illegal value
- 0x0001 to 0x3FFF: Denominator configuration

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

Bits 15:0 **NCL[15:0]**: Numerator configuration low.

Write access to the TUR numerator configuration low is only possible during configuration with FDCAN\_TURCF.ELT = 0 or if FDCAN\_TTOCF.EECS (external clock synchronization enabled) is set. When a new value for NCL is written outside TT configuration mode, the new value takes effect when FDCAN\_TTOST.WECS is cleared to 0. NCL is locked FDCAN\_TTOST.WECS is 1.

0x0000 to FFFF Numerator configuration low

These are write-protected bits, write access is possible only when bit CCE and bit INIT of FDCAN\_CCCR register are set to 1.

*Note:* If  $NC < 7 \times DC$  in TTCAN level 1, subsequent time marks in the trigger memory must differ by at least two NTUs.

### 61.6.6 FDCAN TT operation control register (FDCAN\_TTOCN)

Address offset: 0x0114

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LCKC	Res.	ESCN	NIG	TMG	FGP	GCS	TTIE	TMC[1:0]		RTIE	SWS[1:0]		SWP	ECS	SGT
r		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **LCKC**: TT operation control register locked.

Set by a write access to register FDCAN\_TTOCN. Reset when the updated configuration has been synchronized into the CAN clock domain.

0: Write access to FDCAN\_TTOCN enabled

1: Write access to FDCAN\_TTOCN locked

Bit 14 Reserved, must be kept at reset value.

Bit 13 **ESCN**: External synchronization control

If enabled the FDCAN synchronizes its cycle time phase to an external event signaled by a rising edge at event trigger pin (see [Section 61.4.17: Synchronization to external time schedule](#)).

0: External synchronization disabled

1: External synchronization enabled

Bit 12 **NIG**: Next is gap.

This bit can only be set when the FDCAN is the actual time master and when it is configured for external event-synchronized time-triggered operation (FDCAN\_TTOCF.GEN = 1)

0: No action, reset by reception of any reference message

1: Transmit next reference message with Next\_is\_Gap = 1

Bit 11 **TMG**: Time mark gap.

0: Reset by each reference message

1: Next reference message started when register time mark interrupt FDCAN\_TTIR.RTMI is activated

- Bit 10 **FGP**: Finish gap.  
Set by the CPU, reset by each reference message  
0: No reference message requested  
1: Application requested start of reference message
- Bit 9 **GCS**: Gap control select  
0: Gap control independent from event trigger  
1: Gap control by input event trigger pin
- Bit 8 **TTIE**: Trigger time mark interrupt pulse enable  
External time mark events are configured by trigger memory element TMEX. A trigger time mark interrupt pulse is generated when the trigger memory element becomes active, and the FDCAN is in synchronization state In\_Schedule or In\_Gap.  
0: Trigger time mark interrupt output fdcan1\_tmp for more than one instance and fdcan\_tmp if only one instance disabled  
1: Trigger time mark interrupt output fdcan1\_tmp for more than one instance and fdcan\_tmp if only one instance enabled
- Bits 7:6 **TMC[1:0]**: Register time mark compare.  
00: No Register time mark interrupt generated  
01: Register time mark interrupt if time mark = cycle time  
10: Register time mark interrupt if time mark = local time  
11: Register time mark interrupt if time mark = global time  
*Note: When changing the time mark reference (cycle, local, global time), it is recommended to first write TMC = 00, then reconfigure FDCAN\_TTTMK, and finally set FDCAN\_TMC to the intended time reference.*
- Bit 5 **RTIE**: Register time mark interrupt pulse enable.  
Register time mark interrupts are configured by register FDCAN\_TTTMK. A register time mark interrupt pulse with the length of one fdcan\_tq\_ck period is generated when time referenced by FDCAN\_TTOCN.TMC (cycle, local, or global) is equal to FDCAN\_TTTMK.TM, independently from the synchronization state.  
0: Register time mark interrupt output disabled  
1: Register time mark interrupt output enabled
- Bits 4:3 **SWS[1:0]**: Stop watch source.  
00: Stop watch disabled  
01: Actual value of cycle time is copied to FDCAN\_TTCPT.SWV  
10: Actual value of local time is copied to FDCAN\_TTCPT.SWV  
11: Actual value of global time is copied to FDCAN\_TTCPT.SWV
- Bit 2 **SWP**: Stop watch polarity.  
0: Rising edge trigger  
1: Falling edge trigger
- Bit 1 **ECS**: External clock synchronization.  
Writing a 1 to ECS sets FDCAN\_TTOST.WECS if the node is the actual time master. ECS is reset after one APB clock period. The external clock synchronization takes effect at the start of the next basic cycle.
- Bit 0 **SGT**: Set global time.  
Writing a 1 to SGT sets FDCAN\_TTOST.WGDT if the node is the actual time master. SGT is reset after one APB clock period. The global time preset takes effect when the node transmits the next reference message with the Master\_Ref\_Mark modified by the preset value written to FDCAN\_TTGTP.

### 61.6.7 FDCAN TT global time preset register (FDCAN\_TTGTP)

If TTOST.WGDT is set, the next reference message is transmitted with the Master\_Ref\_Mark modified by the preset value and with Disc\_Bit = 1, presetting the global time in all nodes simultaneously.

TP is reset to 0x0000 each time a reference message with Disc\_Bit = 1 becomes valid or if the node is not the current time master. TP is locked while FDCAN\_TTOST.WGTD = 1 after setting FDCAN\_TTOCN.SGT until the reference message with Disc\_Bit = 1 becomes valid or until the node is no longer the current time master.

Address offset: 0x0118

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CTP[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TP[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **CTP[15:0]**: Cycle time target phase  
 CTP is write-protected while FDCAN\_TTOCN.ESCN or FDCAN\_TTOST.SPL are set (see [Section 61.4.17: Synchronization to external time schedule](#)).  
 0x0000 to FFFF Defines the target value of cycle time when a rising edge of event trigger is expected

Bits 15:0 **TP[15:0]**: Time preset  
 TP is write-protected while FDCAN\_TTOST.WGTD is set.  
 0x0000 to 7FFF next master reference mark = master reference mark + TP  
 0x8000 reserved  
 0x8001–FFFF Next master reference mark = master reference mark - (0x10000 - TP).

### 61.6.8 FDCAN TT time mark register (FDCAN\_TTTMK)

A time mark interrupt (FDCAN\_TTIR.TMI = 1) is generated when the time base indicated by FDCAN\_TTOCN.TMC (cycle time, local time, or global time) has the same value as TM.

Address offset: 0x011C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LCKM	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TICC[6:0]						
r									rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TM[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **LCKM**: TT time mark register locked

Always set by a write access to registers FDCAN\_TTOCN. Set by write access to register FDCAN\_TTTMK when FDCAN\_TTOCN.TMC = 00. Reset when the registers have been synchronized into the CAN clock domain.

0: Write access to FDCAN\_TTTMK enabled

1: Write access to FDCAN\_TTTMK locked

Bits 30:23 Reserved, must be kept at reset value.

Bits 22:16 **TICC[6:0]**: Time mark cycle code

Cycle count for which the time mark is valid.

0b000000x valid for all cycles

0b000001c valid every second cycle at cycle count mod2 = c

0b00001cc valid every fourth cycle at cycle count mod4 = cc

0b0001ccc valid every eighth cycle at cycle count mod8 = ccc

0b001cccc valid every sixteenth cycle at cycle count mod16 = cccc

0b01ccccc valid every thirty-second cycle at cycle count mod32 = cccccc

0b1cccccc valid every sixty-fourth cycle at cycle count mod64 = ccccccc

Bits 15:0 **TM[15:0]**: Time mark

0x0000 to FFFF time mark

*Note: When using byte access to register FDCAN\_TTTMK it is recommended to first disable the time mark compare function (FDCAN\_TTOCN.TMC = 00) to avoid comparisons on inconsistent register values.*

### 61.6.9 FDCAN TT interrupt register (FDCAN\_TTIR)

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the user clears them. A flag is cleared by writing a 1 to the corresponding bit position. Writing a 0 has no effect. A hard reset clears the register.

Address offset: 0x0120

Reset value: 0x0000 0000

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **CER**: Configuration error

Trigger out of order.

0: No error found in trigger list

1: Error found in trigger list

- Bit 17 **AW**: Application watchdog  
0: Application watchdog served in time  
1: Application watchdog not served in time
- Bit 16 **WT**: Watch trigger  
0: No missing reference message  
1: Missing reference message (level 0: cycle time 0xFF00)
- Bit 15 **IWTG**: Initialization watch trigger  
The initialization is restarted by resetting IWT.  
0 No missing reference message during system startup  
1 No system startup due to missing reference message
- Bit 14 **ELC**: Error level changed  
Not set when error level changed during initialization.  
0: No change in error level  
1: Error level changed
- Bit 13 **SE2**: Scheduling error 2  
0: No scheduling error 2  
1: Scheduling error 2 occurred
- Bit 12 **SE1**: Scheduling error 1  
0: No scheduling error 1  
1: Scheduling error 1 occurred
- Bit 11 **TXO**: Tx count overflow  
0: Number of Tx trigger as expected  
1: More Tx trigger than expected in one cycle
- Bit 10 **TXU**: Tx count underflow  
0: Number of Tx trigger as expected  
1: Less Tx trigger than expected in one cycle
- Bit 9 **GTE**: Global time error  
Synchronization deviation SD exceeds limit specified by FDCAN\_TTOCF.LDSDDL, TTCAN level 0, 2 only.  
0: Synchronization deviation within limit  
1: Synchronization deviation exceeded limit
- Bit 8 **GTD**: Global time discontinuity  
0: No discontinuity of global time  
1: Discontinuity of global time
- Bit 7 **GTW**: Global time wrap  
0: No global time wrap occurred  
1: Global time wrap from 0xFFFF to 0x0000 occurred
- Bit 6 **SWE**: Stop watch event  
0: No rising/falling edge at stop watch trigger pin detected  
1: Rising/falling edge at stop watch trigger pin detected

- Bit 5 **TTMI**: Trigger time mark event internal  
 Internal time mark events are configured by trigger memory element TMIN (see [Section 61.4.23](#)). Set when the trigger memory element becomes active, and the FDCAN is in synchronization state In\_Gap or In\_Schedule.  
 0: Time mark not reached  
 1: Time mark reached (level 0: cycle time FDCAN\_TTOCF.RTO x 0x200)
- Bit 4 **RTMI**: Register time mark interrupt  
 Set when time referenced by TTOCN.TMC (cycle, local, or global) is equal to FDCAN\_TTTMK.TM, independently from the synchronization state.  
 0: Time mark not reached  
 1: Time mark reached
- Bit 3 **SOG**: Start of gap  
 0 No reference message seen with Next\_is\_Gap bit set  
 1 Reference message with Next\_is\_Gap bit set becomes valid
- Bit 2 **CSM**: Change of synchronization mode  
 0: No change in master to slave relation or schedule synchronization  
 1: Master to slave relation or schedule synchronization changed, also set when FDCAN\_TTOST.SPL is reset
- Bit 1 **SMC**: Start of matrix cycle  
 0: No matrix cycle started since bit has been reset  
 1: Matrix cycle started
- Bit 0 **SBC**: Start of basic cycle  
 0: No basic cycle started since bit has been reset  
 1: Basic cycle started

### 61.6.10 FDCAN TT interrupt enable register (FDCAN\_TTIE)

The settings in the TT interrupt enable register determine which status changes in the TT interrupt register result in an interrupt.

Address offset: 0x0124

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0: TT interrupt disabled  
1: TT interrupt enabled
- Bit 6 **SWEE**: Stop watch event interrupt enable  
0: TT interrupt disabled  
1: TT interrupt enabled
- Bit 5 **TTMIE**: Trigger time mark event internal interrupt enable  
0: TT interrupt disabled  
1: TT interrupt enabled
- Bit 4 **RTMIE**: Register time mark interrupt enable  
0: TT interrupt disabled  
1: TT interrupt enabled

- Bit 3 **SOGE**: Start of gap interrupt enable  
 0: TT interrupt disabled  
 1: TT interrupt enabled
- Bit 2 **CSME**: Change of synchronization mode interrupt enable  
 0: TT interrupt disabled  
 1: TT interrupt enabled
- Bit 1 **SMCE**: Start of matrix cycle interrupt enable  
 0: TT interrupt disabled  
 1: TT interrupt enabled
- Bit 0 **SBCE**: Start of basic cycle interrupt enable  
 0: TT interrupt disabled  
 1: TT interrupt enabled

### 61.6.11 FDCAN TT interrupt line select register (FDCAN\_TTILS)

The TT interrupt line select register assigns an interrupt generated by a specific interrupt flag from the TT interrupt register to one of the two module interrupt lines. For interrupt generation the respective interrupt line must be enabled via FDCAN\_ILE.EINT0 and FDCAN\_ILE.EINT1.

Address offset: 0x0128

Reset value: 0x0000 0000

### 61.6.12 FDCAN TT operation status register (FDCAN\_TTOST)

Address offset: 0x012C

Reset value: 0x0000 0080

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SPL	WECS	AWE	WFE	GSI	TMP[2:0]			GFI	WGTD	Res.	Res.	Res.	Res.	Res.	Res.
r	r	r	r	r	r	r	r	r	r						
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RTO[7:0]								QCS	QGTP	SYS[1:0]		MS[1:0]		EL[1:0]	
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

- Bit 31 **SPL**: Schedule phase lock  
 The bit is valid only when external synchronization is enabled (FDCAN\_TTOCN.ESCN = 1). In this case it signals that the difference between cycle time configured by FDCAN\_TTGTP.CTP and the cycle time at the rising edge at event trigger pin is less than or equal to 9 NTU (see [Section 61.4.17: Synchronization to external time schedule](#)).  
 0: Phase outside range  
 1: Phase inside range
- Bit 30 **WECS**: Wait for external clock synchronization.  
 0: No external clock synchronization pending  
 1: Node waits for external clock synchronization to take effect. The bit is reset at the start of the next basic cycle.
- Bit 29 **AWE**: Application watchdog event  
 The application watchdog is served by reading FDCAN\_TTOST. When the watchdog is not served in time, bit AWE is set, all FDCAN communication is stopped, and the FDCAN is set into bus monitoring mode.  
 0: Application watchdog served in time  
 1: Failed to serve application watchdog in time
- Bit 28 **WFE**: Wait for event  
 0: No gap announced, reset by a reference message with Next\_is\_Gap = 0  
 1: Reference message with Next\_is\_Gap = 1 received
- Bit 27 **GSI**: Gap started indicator  
 0: No gap in schedule, reset by each reference message and for all time slaves  
 1: Gap time after basic cycle has started
- Bits 26:24 **TMP[2:0]**: Time master priority  
 0x0-7 Priority of actual time master

Bit 23 **GFI**: Gap finished indicator

Set when the CPU writes FDCAN\_TTOCN.FGP, or by a time mark interrupt if TMG = 1, or via input pin (event trigger) if FDCAN\_TTOCN.GCS = 1. Not set by Ref\_Trigger\_Gap or when Gap is finished by another node sending a reference message.

0: Reset at the end of each reference message

1: Gap finished by FDCAN

Bit 22 **WGTD**: Wait for global time discontinuity

0: No global time preset pending

1: Node waits for the global time preset to take effect. The bit is reset when the node has transmitted a reference message with Disc\_Bit = 1 or after it received a reference message.

Bits 21:16 Reserved, must be kept at reset value.

Bits 15:8 **RTO[7:0]**: Reference trigger offset

The reference trigger offset value is a signed integer with a range from -127 (0x81) to 127 (0x7F). There is no notification when the lower limit of -127 is reached. In case the FDCAN becomes time master (MS[1:0] = 11), the reset of RTO is delayed due to synchronization between user and CAN clock domain. For time slaves the value configured by FDCAN\_TTOCF.IRTO is read.

0x00-FF Actual reference trigger offset value

Bit 7 **QCS**: Quality of clock speed

Only relevant in TTCAN level 0 and level 2, otherwise fixed to 1.

0: Local clock speed not synchronized to time master clock speed

1: Synchronization deviation  $\leq$  SDL

Bit 6 **QGTP**: Quality of global time phase

Only relevant in TTCAN level 0 and level 2, otherwise fixed to 0.

0: Global time not valid

1: Global time in phase with time master

Bits 5:4 **SYS[1:0]**: Synchronization state

00: Out of Synchronization

01: Synchronizing to FDCAN communication

10: Schedule suspended by gap (In\_Gap)

11: Synchronized to schedule (In\_Schedule)

Bits 3:2 **MS[1:0]**: Master state

00: Master\_Off, no master properties relevant

01: Operating as time Slave

10: Operating as backup time master

11: Operating as current time master

Bits 1:0 **EL[1:0]**: Error level

00: Severity 0 - No error

01: Severity 1 - Warning

10: Severity 2 - error

11: Severity 3 - Severe error

### 61.6.13 FDCAN TUR numerator actual register (FDCAN\_TURNA)

There is no drift compensation in TTCAN level 1 (NAV = NC). In TTCAN level 0 and level 2, the drift between the node local clock and the time master local clock is calculated. The drift is compensated when the synchronization deviation (difference between NC and the calculated NAV) is lower than  $2 * (\text{FDCAN\_TTOCF.LDSDL} + 5)$ . With

FDCAN\_TTOCF.LDSDL < 7, this results in a maximum range for NAV of (NC - 0x1000) ≤ NAV ≤ (NC + 0x1000).

Address offset: 0x0130

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

LT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 **GT[15:0]**: Global time

Non-fractional part of the sum of the node local time and its local offset (see [Section 61.4.12](#)).

0x0000 to FFFF Global time value of FDCAN network

Bits 15:0 **LT[15:0]**: Local time

Non-fractional part of local time, incremented once each local NTU (see [Section 61.4.12](#)).

0x0000 to FFFF Local time value of FDCAN node

### 61.6.15 FDCAN TT cycle time and count register (FDCAN\_TTCTC)

Address offset: 0x0138

Reset value: 0x003F 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CC[5:0]					
										r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:16 **CC[5:0]**: Cycle count  
 0x00 to 3F Number of actual basic cycle in the system matrix

Bits 15:0 **CT[15:0]**: Cycle time  
 Non-fractional part of the difference of the node local time and Ref\_Mark (see [Section 61.4.12](#)).  
 0x0000 to FFFF: cycle time value of FDCAN basic cycle

**61.6.16 FDCAN TT capture time register (FDCAN\_TTCPT)**

Address offset: 0x013C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SWV[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCV[5:0]					
										r	r	r	r	r	r

Bits 31:16 **SWV[15:0]**: Stop watch value  
 On a rising / falling edge (as configured via FDCAN\_TTOCN.SWP) at the stop watch trigger pin, when FDCAN\_TTOCN.SWS] is different from 00 and FDCAN\_TTIR.SWE is 0, the actual time value as selected by FDCAN\_TTOCN.SWS (cycle, local, global) is copied to SWV and TFDCAN\_TIR.SWE is set to 1. Capturing of the next stop watch value is enabled by resetting FDCAN\_TTIR.SWE.  
 0x0000 to FFFF Captured stop watch value

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:0 **CCV[5:0]**: Cycle count value  
 Cycle count value captured together with SWV.  
 0x00 to 3F: captured cycle count value

**61.6.17 FDCAN TT cycle sync mark register (FDCAN\_TTCSM)**

Address offset: 0x0140

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CSM[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CSM[15:0]**: Cycle sync mark

The cycle sync mark is measured in cycle time. It is updated when the reference message becomes valid and retains its value until the next reference message becomes valid.

0x0000 to FFFF Captured cycle time

### 61.6.18 FDCAN TT trigger select register (FDCAN\_TTTS)

The settings in the FDCAN\_TTTS register select the input to be used as event trigger and stop watch trigger.

Address offset: 0x0300

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Refer to [Section 2.3 on page 129](#) for the register boundary addresses.

## 61.7 CCU registers

### 61.7.1 Clock calibration unit core release register (FDCAN\_CCU\_CREL)

Address offset: 0x0000

Reset value: 0x1114 1218

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REL[3:0]				STEP[3:0]				SUBSTEP[3:0]				YEAR[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MON[7:0]								DAY[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 **REL[3:0]**: Core release = 1

Bits 27:24 **STEP[3:0]**: Step of core release = 1

Bits 23:20 **SUBSTEP[3:0]**: Sub-step of core release = 1

Bits 19:16 **YEAR[3:0]**: Timestamp year =

Bits 15:8 **MON[7:0]**: Timestamp month = 12

Bits 7:0 **DAY[7:0]**: Timestamp day = 18

### 61.7.2 Calibration configuration register (FDCAN\_CCU\_CCFG)

Address offset: 0x0004

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SWR	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CDIV[3:0]			
rW												rW	rW	rW	rW
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OCPM[7:0]								CFL	BCC	Res.	TQBT[4:0]				
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW		rW	rW	rW	rW	rW

Bit 31 **SWR**: Software reset

Writing a 1 to this bit resets the calibration FSM to state Not\_Calibrated (FDCAN\_CCU\_CSTAT.CALS = 00). The calibration watchdog value CWD.WDV is also reset. Registers FDCAN\_CCFG, FDCAN\_CCU\_CSTAT and the calibration watchdog configuration CWD.WDC are unchanged. The bit remains set until reset is completed.

Write access by the user to registers/bits marked with "P = Protected Write" is possible only when FDCAN control bits FDCAN\_CCCR.CCE = 1 AND FDCAN\_CCCR.INIT = 1.

Bits 30:20 Reserved, must be kept at reset value.

Bits 19:16 **CDIV[3:0]**: Clock divider

The clock divider must be configured when the clock calibration is bypassed (BCC = 1) to ensure that the FDCAN requirement is fulfilled.

0000: Divide by 1

0001: Divide by 2

0010: Divide by 4

0011: Divide by 6

0100: Divide by 8

0101: Divide by 10

0110: Divide by 12

0111: Divide by 14

1000: Divide by 16

1001: Divide by 18

1010: Divide by 20

1011: Divide by 22

1100: Divide by 24

1101: Divide by 26

1110: Divide by 28

1111: Divide by 30

Write access by the user to registers/bits marked with "P = Protected Write" is possible only when FDCAN control bits FDCAN\_CCCR.CCE = 1 AND FDCAN\_CCCR.INIT = 1.

Bits 15:8 **OCPM[7:0]**: Oscillator clock periods minimum

Configures the minimum number of periods in two CAN bit times. OCPM is used in basic calibration to avoid false measurements in case of glitches on the bus line. The configured number of periods is  $OCPM \times 32$ . The configuration depends on the frequency and the bitrate configured in FDCAN modules (from 125 kbit/s up to 1 Mbit/s). It is recommended to configure a value slightly below two CAN bit times. The reset value is 1.6 bit times at 80 MHz `fdcan_ker_ck` and 1 Mbit/s CAN bitrate.

Write access by the user to registers/bits marked with "P = Protected Write" is possible only when FDCAN control bits FDCAN\_CCCR.CCE = 1 AND FDCAN\_CCCR.INIT = 1.

Bit 7 **CFL**: Calibration field length

0: Calibration field length is 32 bits

1: Calibration field length is 64 bits

Write access by the user to registers/bits marked with "P = Protected Write" is possible only when FDCAN control bits FDCAN\_CCCR.CCE = 1 AND FDCAN\_CCCR.INIT = 1.

Bit 6 **BCC**: Bypass clock calibration

If this bit is set, the clock input `fdcan_ker_ck` is routed to the time quanta clock through a clock divider configurable via CDIV. In this case the baudrate prescaler of the connected FDCANs must be configured to generate the FDCAN internal time quanta clock.

0: Clock calibration unit generates time quanta clock

1: Clock calibration unit bypassed (default configuration)

## Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **TQBT[4:0]**: Time quanta per bit time

Configures the number of time quanta per bit time. Same value as configured in FDCAN modules. The range of the resulting time quanta clock `fdcan_tq_ck` is from 0.5 MHz (bitrate of 125 kbit/s with 4 tq per bit time) to 25 MHz (bitrate of 1 Mbit/s with 25 tq per bit time). Valid values are 4 to 25. Configured values below 4 are interpreted as 4, values above 25 are interpreted as 25.

Write access by the user to registers/bits marked with "P = Protected Write" is possible only when FDCAN control bits FDCAN\_CCCR.CCE = 1 AND FDCAN\_CCCR.INIT = 1.

### 61.7.3 Calibration status register (FDCAN\_CCU\_CSTAT)

Address offset: 0x0008

Reset value: 0x0203 FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CAL5[1:0]		Res.	TQC[10:0]											OCPC[17:16]	
r	r		r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OCPC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:30 **CALS[1:0]**: Calibration state

00: Not\_Calibrated

01: Basic\_Calibrated

10: Precision\_Calibrated

11: Reserved

Bit 29 Reserved, must be kept at reset value.

Bits 28:18 **TQC[10:0]**: Time quanta counter

Captured number of time quanta in calibration field (32 or 64 bits). Only valid when the clock calibration unit is in state Precision\_Calibrated.

Bits 17:0 **OCPC[17:0]**: Oscillator clock period counter

Captured number of oscillator clock periods in calibration field (32 or 64 bits). Only valid when the clock calibration unit is in state Precision\_Calibrated.

### 61.7.4 Calibration watchdog register (FDCAN\_CCU\_CWD)

Address offset: 0x000C

Reset value: 0x0000 0000

The calibration watchdog is started after the first falling edge when the calibration FSM is in state Not\_Calibrated (FDCAN\_CCU\_CSTAT.CALS = 00). In this state the calibration watchdog monitors the message received. In case no message was received until the calibration watchdog has counted down to 0, the calibration FSM stays in state Not\_Calibrated (FDCAN\_CCU\_CSTAT.CALS = 00), the counter is reloaded with FDCAN\_RWD.WDC and basic calibration is restarted after the next falling edge.

When in state Basic\_Calibrated (FDCAN\_CCU\_CSTAT.CALS = 01), the calibration watchdog is restarted with each received message . In case no message was received until the calibration watchdog has counted down to 0, the calibration FSM returns to state Not\_Calibrated (FDCAN\_CCU\_CSTAT.CALS = 00), the counter is reloaded with FDCAN\_RWD.WDC and basic calibration is restarted after the next falling edge.

When a quartz message is received, state Precision\_Calibrated (FDCAN\_CCU\_CSTAT.CALS = 10) is entered and the calibration watchdog is restarted. In this state the calibration watchdog monitors the quartz message received input. In case no message from a quartz controlled node is received by the attached TTCAN until the calibration watchdog has counted down to 0, the calibration FSM transits back to state

Basic\_Calibrated (FDCAN\_CCU\_CSTAT.CALS = 01). The signal is active when the CAN protocol engine on the attached TTCAN is started i.e. when the INIT bit is reset.

A calibration watchdog event also sets interrupt flag FDCAN\_CCU\_IR.CWE. If enabled by FDCAN\_CCU\_IE.CWEE, interrupt line is activated (set to high). Interrupt line remains active until interrupt flag FDCAN\_CCU\_IR.CWE is reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
WDV[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WDC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **WDV[15:0]**: Watchdog value  
Actual calibration watchdog counter value.

Bits 15:0 **WDC[15:0]**: WDC  
Watchdog configuration  
Start value of the calibration watchdog counter. With the reset value of 00 the counter is disabled.  
Write access by the user to registers/bits marked with "P = Protected Write" is possible only when FDCAN control bits FDCAN\_CCCR.CCE = 1 AND FDCAN\_CCCR.INIT = 1.

### 61.7.5 Clock calibration unit interrupt register (FDCAN\_CCU\_IR)

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the user clears them. A flag is cleared by writing a 1 to the corresponding bit position. Writing a 0 has no effect. A hard reset clears the register. The configuration of FDCAN\_CCU\_IE controls whether an interrupt is generated or not.

Address offset: 0x0010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## 62 USB on-the-go high-speed (OTG\_HS)

### 62.1 Introduction

Portions Copyright (c) Synopsys, Inc. All rights reserved. Used with permission.

This section presents the architecture and the programming model of the OTG\_HS controller.

The following acronyms are used throughout the section:

FS	Full-speed
LS	Low-speed
HS	High-speed
MAC	Media access controller
OTG	On-the-go
PFC	Packet FIFO controller
PHY	Physical layer
USB	Universal serial bus
UTMI	USB 2.0 Transceiver Macrocell interface (UTMI)
ULPI	UTMI+ Low Pin Interface
LPM	Link power management
BCD	Battery charging detector
HNP	Host negotiation protocol
SRP	Session request protocol

References are made to the following documents:

- USB On-The-Go Supplement, Revision 2.0
- Universal Serial Bus Revision 2.0 Specification
- USB 2.0 Link Power Management Addendum Engineering Change Notice to the USB 2.0 specification, July 16, 2007
- Errata for USB 2.0 ECN: Link Power Management (LPM) - 7/2007
- Battery Charging Specification, Revision 1.2

The USB OTG is a dual-role device (DRD) controller that supports both device and host functions and is fully compliant with the *On-The-Go Supplement to the USB 2.0 Specification*. It can also be configured as a host-only or device-only controller, fully compliant with the *USB 2.0 Specification*. OTG\_HS supports the speeds defined in the [Table 498: OTG\\_HS speeds supported](#) below. The USB OTG supports both HNP and SRP. The only external device required is a charge pump for  $V_{BUS}$  in OTG mode.

**Table 498. OTG\_HS speeds supported**

-	HS (480 Mb/s)	FS (12 Mb/s)	LS (1.5 Mb/s)
Host mode	X	X	X
Device mode	X	X	-

## 62.2 OTG\_HS main features

The main features can be divided into three categories: general, host-mode and device-mode features.

### 62.2.1 General features

The OTG\_HS interface general features are the following:

- It is USB-IF certified to the Universal Serial Bus Specification Rev 2.0
- OTG\_HS supports the following PHY interfaces:
  - An on-chip full-speed PHY
  - A ULPI interface for external high-speed PHY
- It includes full support (PHY) for the optional On-The-Go (OTG) protocol detailed in the On-The-Go Supplement Rev 2.0 specification
  - Integrated support for A-B device identification (ID line)
  - Integrated support for host Negotiation protocol (HNP) and session request protocol (SRP)
  - It allows host to turn  $V_{BUS}$  off to conserve battery power in OTG applications
  - It supports OTG monitoring of  $V_{BUS}$  levels with internal comparators
  - It supports dynamic host-peripheral switch of role
- It is software-configurable to operate as:
  - SRP capable USB HS Peripheral (B-device)
  - SRP capable USB HS/LS host (A-device)
  - USB On-The-Go Full-Speed Dual Role device
- It supports HS SOF and LS Keep-alives with
  - SOF pulse PAD connectivity
  - SOF pulse internal connection to timer (TIMx)
  - Configurable framing period
  - Configurable end of frame interrupt
- OTG\_HS embeds an internal DMA with thresholding support and software selectable AHB burst type in DMA mode.
- It supports Descriptor-Based Scatter/Gather DMA controller for device and host mode. (Descriptor-Based Congruent-Sequential DMA is not supported). Scatter/Gather DMA operation is supported in both device and host mode. This feature will improve performance for device mode isochronous endpoints. Note that hubs (split transfers)

are not supported in host scatter/gather DMA mode of operation. Split transfers are supported only in host buffer DMA (internal DMA) mode of operation.

- It includes power saving features such as system stop during USB suspend, switch-off of clock domains internal to the digital core, PHY and DFIFO power management.
- It features a dedicated RAM of 4 Kbytes with advanced FIFO control:
  - Configurable partitioning of RAM space into different FIFOs for flexible and efficient use of RAM
  - Each FIFO can hold multiple packets
  - Dynamic memory allocation
  - Configurable FIFO sizes that are not powers of 2 to allow the use of contiguous memory locations
- It guarantees max USB bandwidth for up to one frame (1 ms) without system intervention.
- It supports charging port detection as described in Battery Charging Specification Revision 1.2 on the FS PHY transceiver only.

### 62.2.2 Host-mode features

The OTG\_HS interface main features and requirements in host-mode are the following:

- External charge pump for  $V_{BUS}$  voltage generation.
- Up to 16 host channels (pipes): each channel is dynamically reconfigurable to allocate any type of USB transfer.
- Built-in hardware scheduler holding:
  - Up to 16 interrupt plus isochronous transfer requests in the periodic hardware queue
  - Up to 16 control plus bulk transfer requests in the non-periodic hardware queue
- Management of a shared Rx FIFO, a periodic Tx FIFO and a nonperiodic Tx FIFO for efficient usage of the USB data RAM.

### 62.2.3 Peripheral-mode features

The OTG\_HS interface main features in peripheral-mode are the following:

- 1 bidirectional control endpoint0
- 8 IN endpoints (EPs) configurable to support bulk, interrupt or isochronous transfers
- 8 OUT endpoints configurable to support bulk, interrupt or isochronous transfers
- Management of a shared Rx FIFO and a Tx-OUT FIFO for efficient usage of the USB data RAM
- Management of up to 9 dedicated Tx-IN FIFOs (one for each active IN EP) to put less load on the application
- Support for the soft disconnect feature.

## 62.3 OTG\_HS implementation

Table 499. OTG\_HS implementation<sup>(1)</sup>

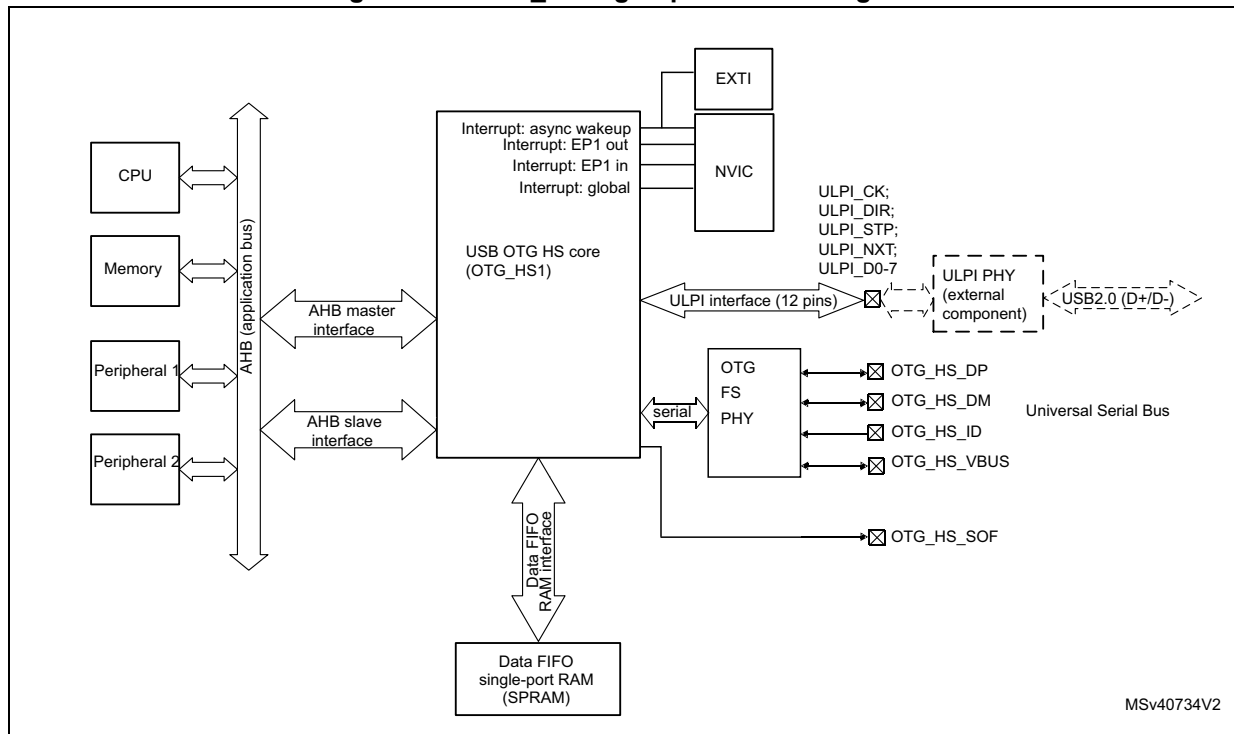

USB features	OTG_HS1
Device bidirectional endpoints (including EP0)	9
Host mode channels	16
Size of dedicated SRAM	4 Kbytes
USB 2.0 link power management (LPM) support	X
OTG revision supported	2.0
Attach detection protocol (ADP) support	-
Battery charging detection (BCD) support	X
ULPI available to primary IOs via, muxing	X
Integrated PHY	FS
Scatter/gather DMA	X

1. "X" = supported, "-" = not supported.

## 62.4 OTG\_HS functional description

### 62.4.1 OTG\_HS block diagram

Figure 719. OTG\_HS high-speed block diagram

## 62.4.2 OTG\_HS pin and internal signals

**Table 500. OTG\_HS input/output pins**

Signal name	Signal type	Description
OTG_HS_DP	Digital input/output	USB OTG D+ line
OTG_HS_DM	Digital input/output	USB OTG D- line
OTG_HS_ID	Digital input	USB OTG ID
OTG_HS_VBUS	Analog input	USB OTG VBUS
OTG_HS_SOF	Digital output	USB OTG Start Of Frame (visibility)
OTG_HS_ULPI_CK	Digital input	USB OTG ULPI clock
OTG_HS_ULPI_DIR	Digital input	USB OTG ULPI data bus direction control
OTG_HS_ULPI_STP	Digital output	USB OTG ULPI data stream stop
OTG_HS_ULPI_NXT	Digital input	USB OTG ULPI next data stream request
OTG_HS_ULPI_D[0..7]	Digital input/output	USB OTG ULPI 8-bit bi-directional data bus

**Table 501. OTG\_HS input/output signals**

Signal name	Signal type	Description
usb_sof	Digital output	USB OTG start-of-frame event for on chip peripherals
usb_wkup	Digital output	USB OTG wakeup event output
usb_gbl_it	Digital output	USB OTG global interrupt
usb_ep1_in_it	Digital output	USB OTG endpoint 1 in interrupt
usb_ep1_out_it	Digital output	USB OTG endpoint 1 out interrupt

## 62.4.3 OTG\_HS core

The USB OTG\_HS receives the 48 MHz clock from the reset and clock controller (RCC). This clock is used for driving the 48 MHz domain at full-speed (12 Mbit/s) and must be enabled prior to configuring the OTG core.

The CPU reads and writes from/to the OTG core registers through the AHB peripheral bus. It is informed of USB events through the single USB OTG interrupt line described in [Section 62.12: OTG\\_HS interrupts](#).

The CPU submits data over the USB by writing 32-bit words to dedicated OTG locations (push registers). The data are then automatically stored into Tx-data FIFOs configured within the USB data RAM. There is one Tx FIFO push register for each in-endpoint (peripheral mode) or out-channel (host mode).

The CPU receives the data from the USB by reading 32-bit words from dedicated OTG addresses (pop registers). The data are then automatically retrieved from a shared Rx FIFO configured within the 4-Kbyte USB data RAM. There is one Rx FIFO pop register for each out-endpoint or in-channel.

The USB protocol layer is driven by the serial interface engine (SIE) and serialized over the USB by the transceiver module within the on-chip physical layer (PHY) or external HS PHY.

**Caution:** To guarantee a correct operation for the USB OTG\_HS peripheral, the AHB frequency should be higher than 30 MHz.

#### 62.4.4 Embedded full-speed OTG PHY connected to OTG\_HS

The embedded full-speed OTG PHY is controlled by the OTG\_HS core and conveys USB control & data signals through the full-speed subset of the UTMI+ Bus (UTMIFS). It provides the physical support to USB connectivity.

The full-speed OTG PHY includes the following components:

- FS/LS transceiver module used by both host and device. It directly drives transmission and reception on the single-ended USB lines.
- DP/DM integrated pull-up and pull-down resistors controlled by the OTG\_HS core depending on the current role of the device. As a peripheral, it enables the DP pull-up resistor to signal full-speed peripheral connections as soon as  $V_{BUS}$  is sensed to be at a valid level (B-session valid). In host mode, pull-down resistors are enabled on both DP/DM. Pull-up and pull-down resistors are dynamically switched when the peripheral role is changed via the host negotiation protocol (HNP).
- Pull-up/pull-down resistor ECN circuit. The DP pull-up consists of 2 resistors controlled separately from the OTG\_HS as per the resistor Engineering Change Notice applied to USB Rev2.0. The dynamic trimming of the DP pull-up strength allows to achieve a better noise rejection and Tx/Rx signal quality.

#### 62.4.5 OTG detections

Additionally the OTG\_HS uses the following functions:

- integrated ID pull-up resistor used to sample the ID line for A/B device identification.
- $V_{BUS}$  sensing comparators with hysteresis used to detect  $V_{BUS}$  valid, A-B session valid and session-end voltage thresholds. They are used to drive the session request protocol (SRP), detect valid startup and end-of-session conditions, and constantly monitor the  $V_{BUS}$  supply during USB operations.

#### 62.4.6 High-speed OTG PHY connected to OTG\_HS

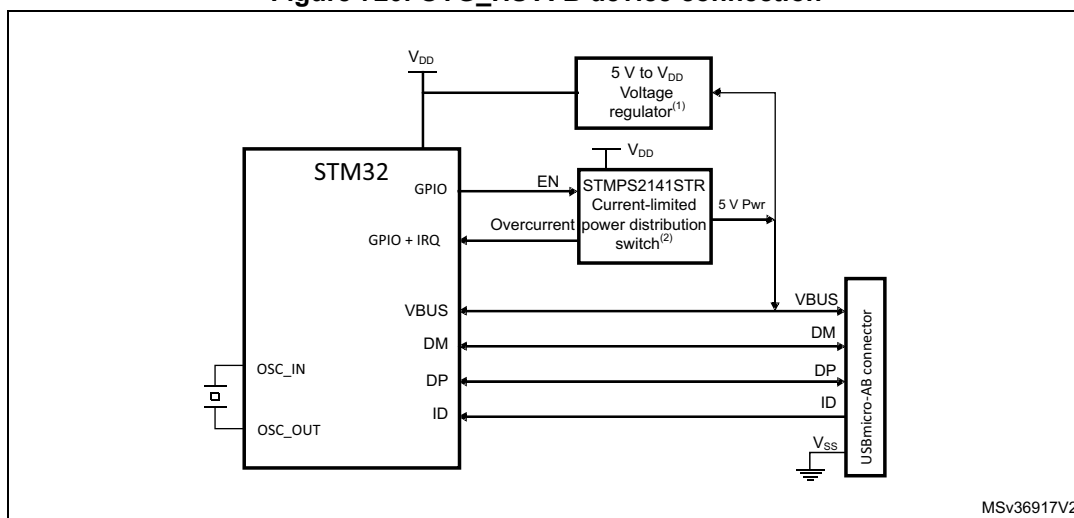

Note: Refer to implementation table to determine if an HS PHY is embedded.

The USB OTG\_HS core includes an ULPI interface to connect an external HS PHY.

Note: In case of multiple OTG\_HS instances, ULPI may not be available on each one. Refer to implementation table.

## 62.5 OTG\_HS dual role device (DRD)

Figure 720. OTG\_HS A-B device connection

1. External voltage regulator only needed when building a VBUS powered device.
2. STMP2141STR needed only if the application has to support a VBUS powered device. A basic power switch can be used if 5 V are available on the application board.

### 62.5.1 ID line detection

The host or peripheral (the default) role is assumed depending on the ID input pin. The ID line status is determined on plugging in the USB cable, depending on whether a MicroA or MicroB plug is connected to the micro-AB receptacle.

- If the B-side of the USB cable is connected with a floating ID wire, the integrated pull-up resistor detects a high ID level and the default peripheral role is confirmed. In this configuration the OTG\_HS complies with the standard FSM described in section 4.2.4: ID pin of the On-the-Go specification Rev2.0, supplement to the USB2.0.
- If the A-side of the USB cable is connected with a grounded ID, the OTG\_HS issues an ID line status change interrupt (CIDSCHG bit in OTG\_GINTSTS) for host software initialization, and automatically switches to the host role. In this configuration the OTG\_HS complies with the standard FSM described by section 4.2.4: ID pin of the On-the-Go specification Rev2.0, supplement to the USB2.0.

### 62.5.2 HNP dual role device

The HNP capable bit in the Global USB configuration register (HNPCAP bit in OTG\_GUSBCFG) enables the OTG\_HS core to dynamically change its role from A-host to A-peripheral and vice-versa, or from B-Peripheral to B-host and vice-versa according to the host negotiation protocol (HNP). The current device status can be read by the combined values of the connector ID status bit in the Global OTG control and status register (CIDSTS bit in OTG\_GOTGCTL) and the current mode of operation bit in the global interrupt and status register (CMOD bit in OTG\_GINTSTS).

The HNP program model is described in detail in [Section 62.15: OTG\\_HS programming model](#).

### 62.5.3 SRP dual role device

The SRP capable bit in the global USB configuration register (SRPCAP bit in OTG\_GUSBCFG) enables the OTG\_HS core to switch off the generation of  $V_{BUS}$  for the A-device to save power. Note that the A-device is always in charge of driving  $V_{BUS}$  regardless of the host or peripheral role of the OTG\_HS.

The SRP A/B-device program model is described in detail in [Section 62.15: OTG\\_HS programming model](#).

## 62.6 OTG\_HS as a USB peripheral

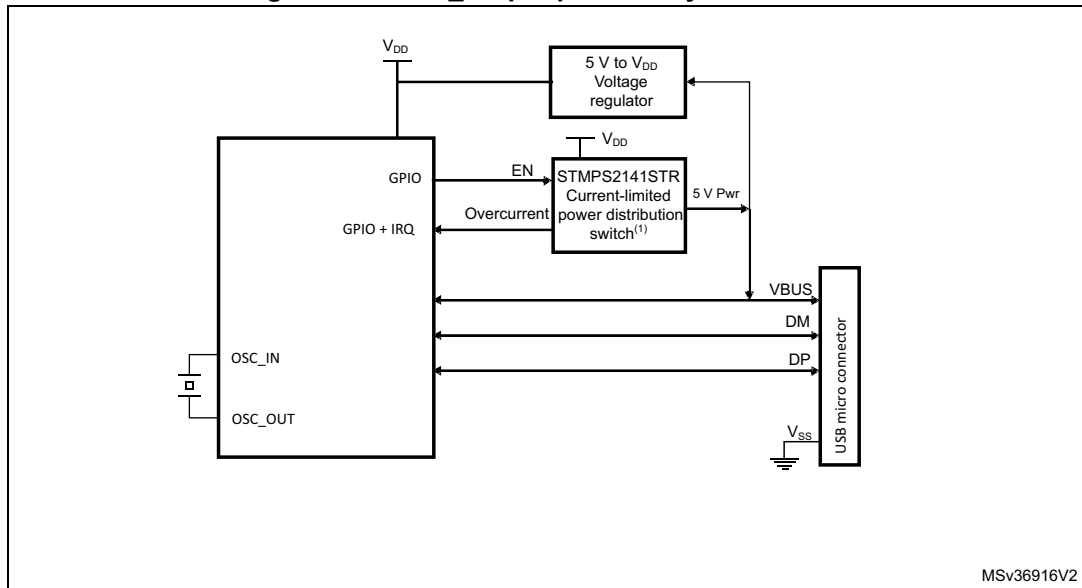

This section gives the functional description of the OTG\_HS in the USB peripheral mode. The OTG\_HS works as an USB peripheral in the following circumstances:

- OTG B-Peripheral
  - OTG B-device default state if B-side of USB cable is plugged in
- OTG A-Peripheral
  - OTG A-device state after the HNP switches the OTG\_HS to its peripheral role
- B-device
  - If the ID line is present, functional and connected to the B-side of the USB cable, and the HNP-capable bit in the Global USB Configuration register (HNPCAP bit in OTG\_GUSBCFG) is cleared.
- Peripheral only
  - The force device mode bit (FDMOD) in the [Section 62.14.4: OTG USB configuration register \(OTG\\_GUSBCFG\)](#) is set to 1, forcing the OTG\_HS core to work as an USB peripheral-only. In this case, the ID line is ignored even if it is present on the USB connector.

*Note:* To build a bus-powered device implementation in case of the B-device or peripheral-only configuration, an external regulator has to be added, that generates the necessary power-supply from  $V_{BUS}$ .

Figure 721. OTG\_HS peripheral-only connection

1. Use a regulator to build a bus-powered device.

### 62.6.1 SRP-capable peripheral

The SRP capable bit in the Global USB configuration register (SRPCAP bit in OTG\_GUSBCFG) enables the OTG\_HS to support the session request protocol (SRP). In this way, it allows the remote A-device to save power by switching off  $V_{BUS}$  while the USB session is suspended.

The SRP peripheral mode program model is described in detail in the [B-device session request protocol](#) section.

### 62.6.2 Peripheral states

#### Powered state

The  $V_{BUS}$  input detects the B-session valid voltage by which the USB peripheral is allowed to enter the powered state (see USB2.0 section 9.1). The OTG\_HS then automatically connects the DP pull-up resistor to signal full-speed device connection to the host and generates the session request interrupt (SRQINT bit in OTG\_GINTSTS) to notify the powered state.

The  $V_{BUS}$  input also ensures that valid  $V_{BUS}$  levels are supplied by the host during USB operations. If a drop in  $V_{BUS}$  below B-session valid happens to be detected (for instance because of a power disturbance or if the host port has been switched off), the OTG\_HS automatically disconnects and the session end detected (SEDET bit in OTG\_GOTGINT) interrupt is generated to notify that the OTG\_HS has exited the powered state.

In the powered state, the OTG\_HS expects to receive some reset signaling from the host. No other USB operation is possible. When a reset signaling is received the reset detected interrupt (USBRST in OTG\_GINTSTS) is generated. When the reset signaling is complete, the enumeration done interrupt (ENUMDNE bit in OTG\_GINTSTS) is generated and the OTG\_HS enters the Default state.

### Soft disconnect

The powered state can be exited by software with the soft disconnect feature. The DP pull-up resistor is removed by setting the soft disconnect bit in the device control register (SDIS bit in OTG\_DCTL), causing a device disconnect detection interrupt on the host side even though the USB cable was not really removed from the host port.

### Default state

In the Default state the OTG\_HS expects to receive a SET\_ADDRESS command from the host. No other USB operation is possible. When a valid SET\_ADDRESS command is decoded on the USB, the application writes the corresponding number into the device address field in the device configuration register (DAD bit in OTG\_DCFG). The OTG\_HS then enters the address state and is ready to answer host transactions at the configured USB address.

### Suspended state

The OTG\_HS peripheral constantly monitors the USB activity. After counting 3 ms of USB idleness, the early suspend interrupt (ESUSP bit in OTG\_GINTSTS) is issued, and confirmed 3 ms later, if appropriate, by the suspend interrupt (USBSUSP bit in OTG\_GINTSTS). The device suspend bit is then automatically set in the device status register (SUSPSTS bit in OTG\_DSTS) and the OTG\_HS enters the suspended state.

The suspended state may optionally be exited by the device itself. In this case the application sets the remote wakeup signaling bit in the device control register (RWUSIG bit in OTG\_DCTL) and clears it after 1 to 15 ms.

When a resume signaling is detected from the host, the resume interrupt (WKUPINT bit in OTG\_GINTSTS) is generated and the device suspend bit is automatically cleared.

## 62.6.3 Peripheral endpoints

The OTG\_HS core instantiates the following USB endpoints:

- Control endpoint 0:
  - Bidirectional and handles control messages only
  - Separate set of registers to handle in and out transactions
  - Proper control (OTG\_DIEPCTL0/OTG\_DOEPCTL0), transfer configuration (OTG\_DIEPTSIZ0/OTG\_DOEPSIZ0), and status-interrupt (OTG\_DIEPINT0/OTG\_DOEPINT0) registers. The available set of bits inside the control and transfer size registers slightly differs from that of other endpoints
- 8 IN endpoints
  - Each of them can be configured to support the isochronous, bulk or interrupt transfer type
  - Each of them has proper control (OTG\_DIEPCTLx), transfer configuration (OTG\_DIEPTSIZx), and status-interrupt (OTG\_DIEPINTx) registers
  - The device IN endpoints common interrupt mask register (OTG\_DIEPMSK) is available to enable/disable a single kind of endpoint interrupt source on all of the IN endpoints (EP0 included)
  - Support for incomplete isochronous IN transfer interrupt (IISOIXFR bit in OTG\_GINTSTS), asserted when there is at least one isochronous IN endpoint on

which the transfer is not completed in the current frame. This interrupt is asserted along with the end of periodic frame interrupt (OTG\_GINTSTS/EOPF).

- 8 OUT endpoints
  - Each of them can be configured to support the isochronous, bulk or interrupt transfer type
  - Each of them has a proper control (OTG\_DOEPCTLx), transfer configuration (OTG\_DOEPTSIZx) and status-interrupt (OTG\_DOEPINTx) register
  - Device OUT endpoints common interrupt mask register (OTG\_DOEPMSK) is available to enable/disable a single kind of endpoint interrupt source on all of the OUT endpoints (EP0 included)
  - Support for incomplete isochronous OUT transfer interrupt (INCOMPISOOUT bit in OTG\_GINTSTS), asserted when there is at least one isochronous OUT endpoint on which the transfer is not completed in the current frame. This interrupt is asserted along with the end of periodic frame interrupt (OTG\_GINTSTS/EOPF).

### Endpoint control

- The following endpoint controls are available to the application through the device endpoint-x IN/OUT control register (OTG\_DIEPCTLx/OTG\_DOEPCTLx):
  - Endpoint enable/disable
  - Endpoint activate in current configuration
  - Program USB transfer type (isochronous, bulk, interrupt)
  - Program supported packet size
  - Program Tx FIFO number associated with the IN endpoint
  - Program the expected or transmitted data0/data1 PID (bulk/interrupt only)
  - Program the even/odd frame during which the transaction is received or transmitted (isochronous only)
  - Optionally program the NAK bit to always negative-acknowledge the host regardless of the FIFO status
  - Optionally program the STALL bit to always stall host tokens to that endpoint
  - Optionally program the SNOOP mode for OUT endpoint not to check the CRC field of received data

### Endpoint transfer

The device endpoint-x transfer size registers (OTG\_DIEPTSIZx/OTG\_DOEPTSIZx) allow the application to program the transfer size parameters and read the transfer status. Programming must be done before setting the endpoint enable bit in the endpoint control register. Once the endpoint is enabled, these fields are read-only as the OTG\_HS core updates them with the current transfer status.

The following transfer parameters can be programmed:

- Transfer size in bytes
- Number of packets that constitute the overall transfer size

### Endpoint status/interrupt

The device endpoint-x interrupt registers (OTG\_DIEPINTx/OTG\_DOEPINTx) indicate the status of an endpoint with respect to USB- and AHB-related events. The application must read these registers when the OUT endpoint interrupt bit or the IN endpoint interrupt bit in

the core interrupt register (OEPINT bit in OTG\_GINTSTS or IEPINT bit in OTG\_GINTSTS, respectively) is set. Before the application can read these registers, it must first read the device all endpoints interrupt (OTG\_DAINTE) register to get the exact endpoint number for the device endpoint-x interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the OTG\_DAINTE and OTG\_GINTSTS registers

The peripheral core provides the following status checks and interrupt generation:

- Transfer completed interrupt, indicating that data transfer was completed on both the application (AHB) and USB sides
- Setup stage has been done (control-out only)
- Associated transmit FIFO is half or completely empty (in endpoints)
- NAK acknowledge has been transmitted to the host (isochronous-in only)
- IN token received when Tx FIFO was empty (bulk-in/interrupt-in only)
- Out token received when endpoint was not yet enabled
- Babble error condition has been detected
- Endpoint disable by application is effective
- Endpoint NAK by application is effective (isochronous-in only)
- More than 3 back-to-back setup packets were received (control-out only)
- Timeout condition detected (control-in only)
- Isochronous out packet has been dropped, without generating an interrupt

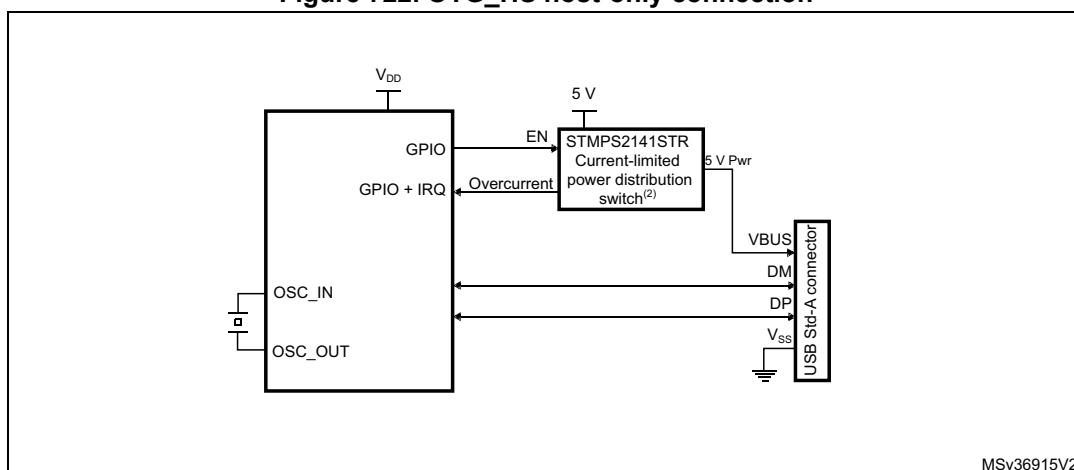

## 62.7 OTG\_HS as a USB host

This section gives the functional description of the OTG\_HS in the USB host mode. The OTG\_HS works as a USB host in the following circumstances:

- OTG A-host
  - OTG A-device default state when the A-side of the USB cable is plugged in
- OTG B-host
  - OTG B-device after HNP switching to the host role
- A-device
  - If the ID line is present, functional and connected to the A-side of the USB cable, and the HNP-capable bit is cleared in the Global USB Configuration register (HNPCAP bit in OTG\_GUSBCFG). Integrated pull-down resistors are automatically set on the DP/DM lines.
- Host only
  - The force host mode bit (FHMOD) in the [OTG USB configuration register \(OTG\\_GUSBCFG\)](#) forces the OTG\_HS core to work as a USB host-only. In this case, the ID line is ignored even if present on the USB connector. Integrated pull-down resistors are automatically set on the DP/DM lines.

*Note:* On-chip 5 V  $V_{BUS}$  generation is not supported. For this reason, a charge pump or, if 5 V are available on the application board, a basic power switch must be added externally to drive the 5 V  $V_{BUS}$  line. The external charge pump can be driven by any GPIO output. This is required for the OTG A-host, A-device and host-only configurations.

Figure 722. OTG\_HS host-only connection

1.  $V_{DD}$  range is between 2 V and 3.6 V.

### 62.7.1 SRP-capable host

SRP support is available through the SRP capable bit in the global USB configuration register (SRPCAP bit in OTG\_GUSBCFG). With the SRP feature enabled, the host can save power by switching off the  $V_{BUS}$  power while the USB session is suspended.

The SRP host mode program model is described in detail in the [A-device session request protocol](#) section.

### 62.7.2 USB host states

#### Host port power

On-chip 5 V  $V_{BUS}$  generation is not supported. For this reason, a charge pump or, if 5 V are available on the application board, a basic power switch, must be added externally to drive the 5 V  $V_{BUS}$  line. The external charge pump can be driven by any GPIO output or via an I<sup>2</sup>C interface connected to an external PMIC (power management IC). When the application decides to power on  $V_{BUS}$ , it must also set the port power bit in the host port control and status register (PPWR bit in OTG\_HPRT).

#### $V_{BUS}$ valid

When HNP or SRP is enabled the VBUS sensing pin should be connected to  $V_{BUS}$ . The  $V_{BUS}$  input ensures that valid  $V_{BUS}$  levels are supplied by the charge pump during USB operations. Any unforeseen  $V_{BUS}$  voltage drop below the  $V_{BUS}$  valid threshold (4.4 V) leads to an OTG interrupt triggered by the session end detected bit (SEDET bit in OTG\_GOTGINT). The application is then required to remove the  $V_{BUS}$  power and clear the port power bit.

When HNP and SRP are both disabled, the VBUS sensing pin does not need to be connected to  $V_{BUS}$ .

The charge pump overcurrent flag can also be used to prevent electrical damage. Connect the overcurrent flag output from the charge pump to any GPIO input and configure it to generate a port interrupt on the active level. The overcurrent ISR must promptly disable the  $V_{BUS}$  generation and clear the port power bit.

### Host detection of a peripheral connection

If SRP or HNP are enabled, even if USB peripherals or B-devices can be attached at any time, the OTG\_HS does not detect any bus connection until  $V_{BUS}$  is no longer sensed at a valid level (5 V). When  $V_{BUS}$  is at a valid level and a remote B-device is attached, the OTG\_HS core issues a host port interrupt triggered by the device connected bit in the host port control and status register (PCDET bit in OTG\_HPRT).

When HNP and SRP are both disabled, USB peripherals or B-device are detected as soon as they are connected. The OTG\_HS core issues a host port interrupt triggered by the device connected bit in the host port control and status (PCDET bit in OTG\_HPRT).

### Host detection of peripheral a disconnection

The peripheral disconnection event triggers the disconnect detected interrupt (DISCINT bit in OTG\_GINTSTS).

### Host enumeration

After detecting a peripheral connection the host must start the enumeration process by sending USB reset and configuration commands to the new peripheral.

Before starting to drive a USB reset, the application waits for the OTG interrupt triggered by the debounce done bit (DBCDNE bit in OTG\_GOTGINT), which indicates that the bus is stable again after the electrical debounce caused by the attachment of a pull-up resistor on DP (FS) or DM (LS).

The application drives a USB reset signaling (single-ended zero) over the USB by keeping the port reset bit set in the host port control and status register (PRST bit in OTG\_HPRT) for a minimum of 10 ms and a maximum of 20 ms. The application takes care of the timing count and then of clearing the port reset bit.

Once the USB reset sequence has completed, the host port interrupt is triggered by the port enable/disable change bit (PENCHNG bit in OTG\_HPRT). This informs the application that the speed of the enumerated peripheral can be read from the port speed field in the host port control and status register (PSPD bit in OTG\_HPRT) and that the host is starting to drive SOFs (FS) or Keep alives (LS). The host is now ready to complete the peripheral enumeration by sending peripheral configuration commands.

### Host suspend

The application decides to suspend the USB activity by setting the port suspend bit in the host port control and status register (PSUSP bit in OTG\_HPRT). The OTG\_HS core stops sending SOFs and enters the suspended state.

The suspended state can be optionally exited on the remote device's initiative (remote wakeup). In this case the remote wakeup interrupt (WKUPINT bit in OTG\_GINTSTS) is generated upon detection of a remote wakeup signaling, the port resume bit in the host port control and status register (PRES bit in OTG\_HPRT) self-sets, and resume signaling is automatically driven over the USB. The application must time the resume window and then clear the port resume bit to exit the suspended state and restart the SOF.

If the suspended state is exited on the host initiative, the application must set the port resume bit to start resume signaling on the host port, time the resume window and finally clear the port resume bit.

### 62.7.3 Host channels

The OTG\_HS core instantiates 16 host channels. Each host channel supports an USB host transfer (USB pipe). The host is not able to support more than 16 transfer requests at the same time. If more than 16 transfer requests are pending from the application, the host controller driver (HCD) must re-allocate channels when they become available from previous duty, that is, after receiving the transfer completed and channel halted interrupts.

Each host channel can be configured to support in/out and any type of periodic/nonperiodic transaction. Each host channel makes use of proper control (OTG\_HCCHARx), transfer configuration (OTG\_HCTSIZx) and status/interrupt (OTG\_HCINTx) registers with associated mask (OTG\_HCINTMSKx) registers.

#### Host channel control

- The following host channel controls are available to the application through the host channel-x characteristics register (OTG\_HCCHARx):
  - Channel enable/disable
  - Program the HS/FS/LS speed of target USB peripheral
  - Program the address of target USB peripheral
  - Program the endpoint number of target USB peripheral
  - Program the transfer IN/OUT direction
  - Program the USB transfer type (control, bulk, interrupt, isochronous)
  - Program the maximum packet size (MPS)
  - Program the periodic transfer to be executed during odd/even frames

#### Host channel transfer

The host channel transfer size registers (OTG\_HCTSIZx) allow the application to program the transfer size parameters, and read the transfer status. Programming must be done before setting the channel enable bit in the host channel characteristics register. Once the endpoint is enabled the packet count field is read-only as the OTG\_HS core updates it according to the current transfer status.

- The following transfer parameters can be programmed:
  - transfer size in bytes
  - number of packets making up the overall transfer size
  - initial data PID

#### Host channel status/interrupt

The host channel-x interrupt register (OTG\_HCINTx) indicates the status of an endpoint with respect to USB- and AHB-related events. The application must read these register when the host channels interrupt bit in the core interrupt register (HCINT bit in OTG\_GINTSTS) is set. Before the application can read these registers, it must first read the host all channels interrupt (OTG\_HAINT) register to get the exact channel number for the host channel-x interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the OTG\_HAINT and OTG\_GINTSTS registers.

The mask bits for each interrupt source of each channel are also available in the OTG\_HCINTMSKx register.

- The host core provides the following status checks and interrupt generation:
  - Transfer completed interrupt, indicating that the data transfer is complete on both the application (AHB) and USB sides
  - Channel has stopped due to transfer completed, USB transaction error or disable command from the application
  - Associated transmit FIFO is half or completely empty (IN endpoints)
  - ACK response received
  - NAK response received
  - STALL response received
  - USB transaction error due to CRC failure, timeout, bit stuff error, false EOP
  - Babble error
  - frame overrun
  - data toggle error

#### 62.7.4 Host scheduler

The host core features a built-in hardware scheduler which is able to autonomously re-order and manage the USB transaction requests posted by the application. At the beginning of each frame the host executes the periodic (isochronous and interrupt) transactions first, followed by the nonperiodic (control and bulk) transactions to achieve the higher level of priority granted to the isochronous and interrupt transfer types by the USB specification.

The host processes the USB transactions through request queues (one for periodic and one for nonperiodic). Each request queue can hold up to 8 entries. Each entry represents a pending transaction request from the application, and holds the IN or OUT channel number along with other information to perform a transaction on the USB. The order in which the requests are written to the queue determines the sequence of the transactions on the USB interface.

At the beginning of each frame, the host processes the periodic request queue first, followed by the nonperiodic request queue. The host issues an incomplete periodic transfer interrupt (IPXFR bit in OTG\_GINTSTS) if an isochronous or interrupt transaction scheduled for the current frame is still pending at the end of the current frame. The OTG\_HS core is fully responsible for the management of the periodic and nonperiodic request queues. The periodic transmit FIFO and queue status register (OTG\_HPTXSTS) and nonperiodic transmit FIFO and queue status register (OTG\_HNPTXSTS) are read-only registers which can be used by the application to read the status of each request queue. They contain:

- The number of free entries currently available in the periodic (nonperiodic) request queue (8 max)
- Free space currently available in the periodic (nonperiodic) Tx FIFO (out-transactions)
- IN/OUT token, host channel number and other status information.

As request queues can hold a maximum of 8 entries each, the application can push to schedule host transactions in advance with respect to the moment they physically reach the SB for a maximum of 8 pending periodic transactions plus 8 pending non-periodic transactions.

To post a transaction request to the host scheduler (queue) the application must check that there is at least 1 entry available in the periodic (nonperiodic) request queue by reading the

PTXQSAV bits in the OTG\_HNPTXSTS register or NPTQXSAV bits in the OTG\_HNPTXSTS register.

## 62.8 OTG\_HS SOF trigger

Figure 723. SOF connectivity (SOF trigger output to TIM and ITR1 connection)

The OTG\_HS core provides means to monitor, track and configure SOF framing in the host and peripheral, as well as an SOF pulse output connectivity feature.

Such utilities are especially useful for adaptive audio clock generation techniques, where the audio peripheral needs to synchronize to the isochronous stream provided by the PC, or the host needs to trim its framing rate according to the requirements of the audio peripheral.

### 62.8.1 Host SOFs

In host mode the number of PHY clocks occurring between the generation of two consecutive SOF (HS/FS) or Keep-alive (LS) tokens is programmable in the host frame interval register (HFIR), thus providing application control over the SOF framing period. An interrupt is generated at any start of frame (SOF bit in OTG\_GINTSTS). The current frame number and the time remaining until the next SOF are tracked in the host frame number register (HFNUM).

A SOF pulse signal, is generated at any SOF starting token and with a width of 20 HCLK cycles. The SOF pulse is also internally connected to the input trigger of the timer, so that the input capture feature, the output compare feature and the timer can be triggered by the SOF pulse.

### 62.8.2 Peripheral SOFs

In device mode, the start of frame interrupt is generated each time an SOF token is received on the USB (SOF bit in OTG\_GINTSTS). The corresponding frame number can be read from the device status register (FNSOF bit in OTG\_DSTS). A SOF pulse signal with a width of 20 HCLK cycles is also generated. The SOF pulse signal is also internally connected to the TIM input trigger, so that the input capture feature, the output compare feature and the timer can be triggered by the SOF pulse.

The end of periodic frame interrupt (OTG\_GINTSTS/EOPF) is used to notify the application when 80%, 85%, 90% or 95% of the time frame interval elapsed depending on the periodic frame interval field in the device configuration register (PFIVL bit in OTG\_DCFG). This feature can be used to determine if all of the isochronous traffic for that frame is complete.

## 62.9 OTG\_HS low-power modes

Table 502 below defines the STM32 low power modes and their compatibility with the OTG.

**Table 502. Compatibility of STM32 low power modes with the OTG**

Mode	Description	USB compatibility
Run	MCU fully active	Required when USB not in suspend state.
Sleep	USB suspend exit causes the device to exit Sleep mode. Peripheral registers content is kept.	Available while USB is in suspend state.
Stop	USB suspend exit causes the device to exit Stop mode. Peripheral registers content is kept <sup>(1)</sup> .	Available while USB is in suspend state.
Standby	Powered-down. The peripheral must be reinitialized after exiting Standby mode.	Not compatible with USB applications.

1. Within Stop mode there are different possible settings. Some restrictions may also exist, refer to [Section 6: Power control \(PWR\)](#) to understand which (if any) restrictions apply when using OTG.

The following bits and procedures reduce power consumption.

The power consumption of the OTG PHY is controlled by two or three bits in the general core configuration register, depending on OTG revision supported.

- PHY power down (OTG\_GCCFG/PWRDWN)  
It switches on/off the full-speed transceiver module of the PHY. It must be preliminarily set to allow any USB operation
- V<sub>BUS</sub> detection enable (OTG\_GCCFG/VBDEN)  
It switches on/off the V<sub>BUS</sub> sensing comparators associated with OTG operations

Power reduction techniques are available while in the USB suspended state, when the USB session is not yet valid or the device is disconnected.

- Stop PHY clock (STPPCLK bit in OTG\_PCGCCTL)  
When setting the stop PHY clock bit in the clock gating control register, most of the 48 MHz clock domain internal to the OTG core is switched off by clock gating. The dynamic power consumption due to the USB clock switching activity is cut even if the 48 MHz clock input is kept running by the application  
Most of the transceiver is also disabled, and only the part in charge of detecting the asynchronous resume or remote wakeup event is kept alive.
- Gate HCLK (GATEHCLK bit in OTG\_PCGCCTL)  
When setting the Gate HCLK bit in the clock gating control register, most of the system clock domain internal to the OTG\_HS core is switched off by clock gating. Only the register read and write interface is kept alive. The dynamic power consumption due to

the USB clock switching activity is cut even if the system clock is kept running by the application for other purposes.

- USB system stop

When the OTG\_HS is in the USB suspended state, the application may decide to drastically reduce the overall power consumption by a complete shut down of all the clock sources in the system. USB System Stop is activated by first setting the Stop PHY clock bit and then configuring the system deep sleep mode in the power control system module (PWR).

The OTG\_HS core automatically reactivates both system and USB clocks by asynchronous detection of remote wakeup (as an host) or resume (as a device) signaling on the USB.

To save dynamic power, the USB data FIFO is clocked only when accessed by the OTG\_HS core.

### 62.10 OTG\_HS Dynamic update of the OTG\_HFIR register

The USB core embeds a dynamic trimming capability of micro-SOF framing period in host mode allowing to synchronize an external device with the micro-SOF frames.

When the OTG\_HFIR register is changed within a current micro-SOF frame, the SOF period correction is applied in the next frame as described in [Figure 724](#).

For a dynamic update, it is required to set RLDCTRL=1.

**Figure 724. Updating OTG\_HFIR dynamically (RLDCTRL = 1)**

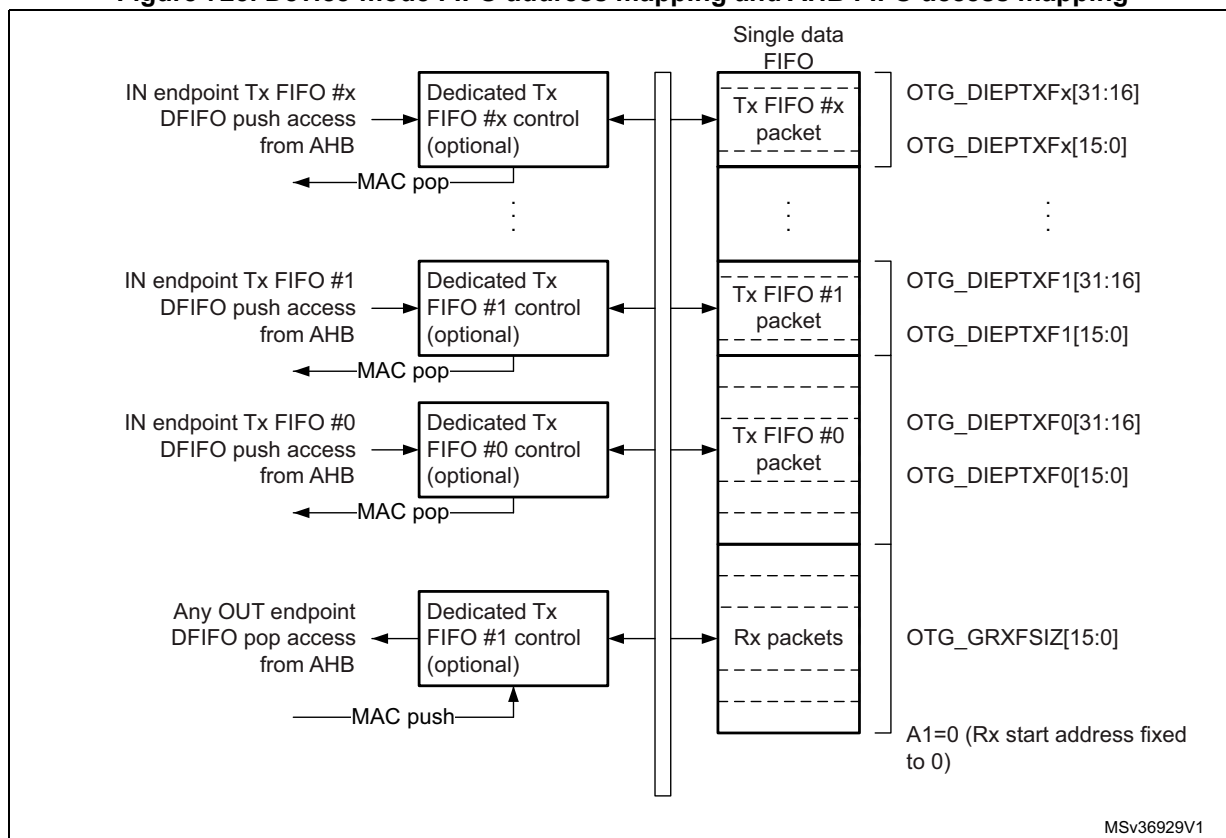

### 62.11 OTG\_HS data FIFOs

The USB system features 4 Kbytes of dedicated RAM with a sophisticated FIFO control mechanism. The packet FIFO controller module in the OTG\_HS core organizes RAM space into Tx FIFOs into which the application pushes the data to be temporarily stored before the USB transmission, and into a single Rx FIFO where the data received from the USB are temporarily stored before retrieval (popped) by the application. The number of instructed FIFOs and how these are organized inside the RAM depends on the device's role. In peripheral mode an additional Tx FIFO is instructed for each active IN endpoint. Any FIFO size is software configured to better meet the application requirements.

### 62.11.1 Peripheral FIFO architecture

Figure 725. Device-mode FIFO address mapping and AHB FIFO access mapping

#### Peripheral Rx FIFO

The OTG peripheral uses a single receive FIFO that receives the data directed to all OUT endpoints. Received packets are stacked back-to-back until free space is available in the Rx FIFO. The status of the received packet (which contains the OUT endpoint destination number, the byte count, the data PID and the validity of the received data) is also stored by the core on top of the data payload. When no more space is available, host transactions are NACKed and an interrupt is received on the addressed endpoint. The size of the receive FIFO is configured in the receive FIFO size register (OTG\_GRXFSIZ).

The single receive FIFO architecture makes it more efficient for the USB peripheral to fill in the receive RAM buffer:

- All OUT endpoints share the same RAM buffer (shared FIFO)
- The OTG\_HS core can fill in the receive FIFO up to the limit for any host sequence of OUT tokens

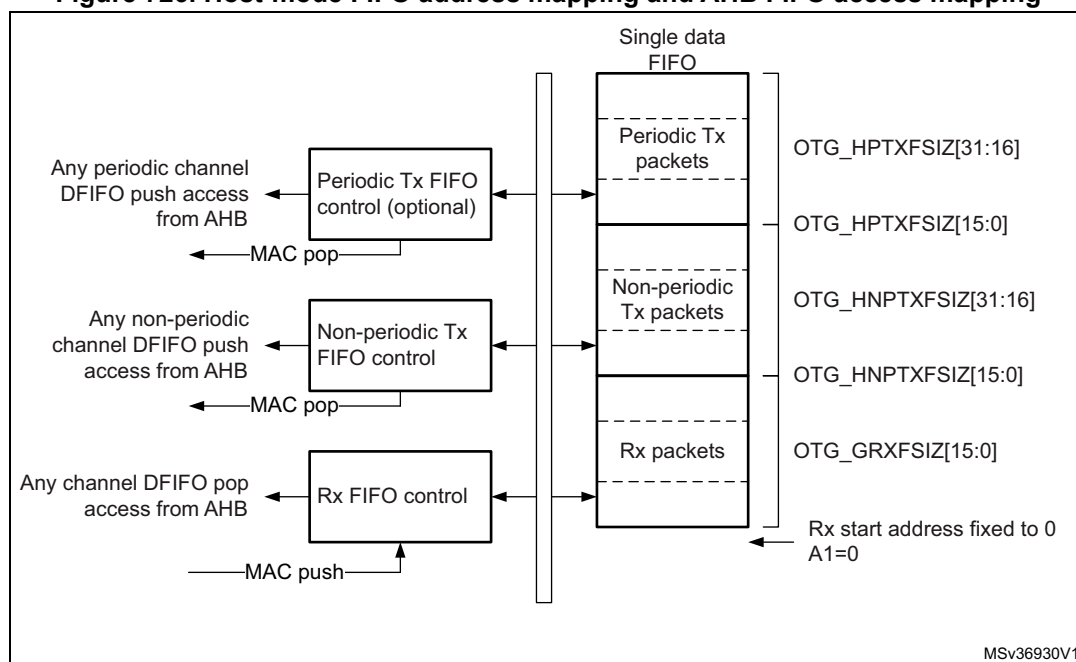

The application keeps receiving the Rx FIFO non-empty interrupt (RXFLVL bit in OTG\_GINTSTS) as long as there is at least one packet available for download. It reads the packet information from the receive status read and pop register (OTG\_GRXSTSP) and finally pops data off the receive FIFO by reading from the endpoint-related pop address.

### Peripheral Tx FIFOs

The core has a dedicated FIFO for each IN endpoint. The application configures FIFO sizes by writing the endpoint 0 transmit FIFO size register (OTG\_DIEPTXF0) for IN endpoint0 and the device IN endpoint transmit FIFOx registers (OTG\_DIEPTXFx) for IN endpoint-x.

### 62.11.2 Host FIFO architecture

Figure 726. Host-mode FIFO address mapping and AHB FIFO access mapping

### Host Rx FIFO

The host uses one receiver FIFO for all periodic and nonperiodic transactions. The FIFO is used as a receive buffer to hold the received data (payload of the received packet) from the USB until it is transferred to the system memory. Packets received from any remote IN endpoint are stacked back-to-back until free space is available. The status of each received packet with the host channel destination, byte count, data PID and validity of the received data are also stored into the FIFO. The size of the receive FIFO is configured in the receive FIFO size register (OTG\_GRXF0SIZ).

The single receive FIFO architecture makes it highly efficient for the USB host to fill in the receive data buffer:

- All IN configured host channels share the same RAM buffer (shared FIFO)
- The OTG\_HS core can fill in the receive FIFO up to the limit for any sequence of IN tokens driven by the host software

The application receives the Rx FIFO not-empty interrupt as long as there is at least one packet available for download. It reads the packet information from the receive status read and pop register and finally pops the data off the receive FIFO.

## Host Tx FIFOs

The host uses one transmit FIFO for all non-periodic (control and bulk) OUT transactions and one transmit FIFO for all periodic (isochronous and interrupt) OUT transactions. FIFOs are used as transmit buffers to hold the data (payload of the transmit packet) to be transmitted over the USB. The size of the periodic (nonperiodic) Tx FIFO is configured in the host periodic (nonperiodic) transmit FIFO size OTG\_HPTXFSIZ / OTG\_HNPTXFSIZ register.

The two Tx FIFO implementation derives from the higher priority granted to the periodic type of traffic over the USB frame. At the beginning of each frame, the built-in host scheduler processes the periodic request queue first, followed by the nonperiodic request queue.

The two transmit FIFO architecture provides the USB host with separate optimization for periodic and nonperiodic transmit data buffer management:

- All host channels configured to support periodic (nonperiodic) transactions in the OUT direction share the same RAM buffer (shared FIFOs)
- The OTG\_HS core can fill in the periodic (nonperiodic) transmit FIFO up to the limit for any sequence of OUT tokens driven by the host software

The OTG\_HS core issues the periodic Tx FIFO empty interrupt (PTXFE bit in OTG\_GINTSTS) as long as the periodic Tx FIFO is half or completely empty, depending on the value of the periodic Tx FIFO empty level bit in the AHB configuration register (PTXFELVL bit in OTG\_GAHBCFG). The application can push the transmission data in advance as long as free space is available in both the periodic Tx FIFO and the periodic request queue. The host periodic transmit FIFO and queue status register (OTG\_HPTXSTS) can be read to know how much space is available in both.

OTG\_HS core issues the non periodic Tx FIFO empty interrupt (NPTXFE bit in OTG\_GINTSTS) as long as the nonperiodic Tx FIFO is half or completely empty depending on the non periodic Tx FIFO empty level bit in the AHB configuration register (TXFELVL bit in OTG\_GAHBCFG). The application can push the transmission data as long as free space is available in both the nonperiodic Tx FIFO and nonperiodic request queue. The host nonperiodic transmit FIFO and queue status register (OTG\_HNPTXSTS) can be read to know how much space is available in both.

## 62.11.3 FIFO RAM allocation

### Device mode

**Receive FIFO RAM allocation:** the application should allocate RAM for SETUP packets:

- 10 locations must be reserved in the receive FIFO to receive SETUP packets on control endpoint. The core does not use these locations, which are reserved for SETUP packets, to write any other data.
- One location is to be allocated for Global OUT NAK.
- Status information is written to the FIFO along with each received packet. Therefore, a minimum space of  $(\text{largest packet size} / 4) + 1$  must be allocated to receive packets. If multiple isochronous endpoints are enabled, then at least two  $(\text{largest packet size} / 4) + 1$  spaces must be allocated to receive back-to-back packets. Typically, two  $(\text{largest packet size} / 4) + 1$  spaces are recommended so that when the previous packet is being transferred to the CPU, the USB can receive the subsequent packet.
- Along with the last packet for each endpoint, transfer complete status information is also pushed to the FIFO. One location for each OUT endpoint is recommended.

Device RxFIFO =

$(5 * \text{number of control endpoints} + 8) + ((\text{largest USB packet used} / 4) + 1 \text{ for status information}) + (2 * \text{number of OUT endpoints}) + 1 \text{ for Global NAK}$

Example: The MPS is 1,024 bytes for a periodic USB packet and 512 bytes for a non-periodic USB packet. There are three OUT endpoints, three IN endpoints, one control endpoint, and three host channels.

Device RxFIFO =  $(5 * 1 + 8) + ((1,024 / 4) + 1) + (2 * 4) + 1 = 279$

**Transmit FIFO RAM allocation:** the minimum RAM space required for each IN endpoint Transmit FIFO is the maximum packet size for that particular IN endpoint.

*Note: More space allocated in the transmit IN endpoint FIFO results in better performance on the USB.*

### Host mode

Receive FIFO RAM allocation:

Status information is written to the FIFO along with each received packet. Therefore, a minimum space of  $(\text{largest packet size} / 4) + 1$  must be allocated to receive packets. If multiple isochronous channels are enabled, then at least two  $(\text{largest packet size} / 4) + 1$  spaces must be allocated to receive back-to-back packets. Typically, two  $(\text{largest packet size} / 4) + 1$  spaces are recommended so that when the previous packet is being transferred to the CPU, the USB can receive the subsequent packet.

Along with the last packet in the host channel, transfer complete status information is also pushed to the FIFO. So one location must be allocated for this.

Host RxFIFO =  $(\text{largest USB packet used} / 4) + 1 \text{ for status information} + 1 \text{ transfer complete}$

Example: Host RxFIFO =  $((1,024 / 4) + 1) + 1 = 258$

Transmit FIFO RAM allocation:

The minimum amount of RAM required for the host Non-periodic Transmit FIFO is the largest maximum packet size among all supported non-periodic OUT channels.

Typically, two largest packet sizes worth of space is recommended, so that when the current packet is under transfer to the USB, the CPU can get the next packet.

Non-Periodic TxFIFO =  $\text{largest non-periodic USB packet used} / 4$

Example: Non-Periodic TxFIFO =  $(512 / 4) = 128$

The minimum amount of RAM required for host periodic Transmit FIFO is the largest maximum packet size out of all the supported periodic OUT channels. If there is at least one isochronous OUT endpoint, then the space must be at least two times the maximum packet size of that channel.

Host Periodic TxFIFO =  $\text{largest periodic USB packet used} / 4$

Example: Host Periodic TxFIFO =  $(1,024 / 4) = 256$

*Note: More space allocated in the Transmit Non-periodic FIFO results in better performance on the USB.*

## 62.12 OTG\_HS interrupts

When the OTG\_HS controller is operating in one mode, either device or host, the application must not access registers from the other mode. If an illegal access occurs, a mode mismatch interrupt is generated and reflected in the core interrupt register (MMIS bit in the OTG\_GINTSTS register). When the core switches from one mode to the other, the registers in the new mode of operation must be reprogrammed as they would be after a power-on reset.

[Figure 727](#) shows the interrupt hierarchy.

Figure 727. Interrupt hierarchy

MSv47472V3

1. OTG\_HS\_WKUP becomes active (high state) when resume condition occurs during L1 SLEEP or L2 SUSPEND states.

## 62.13 OTG\_HS control and status registers

By reading from and writing to the control and status registers (CSRs) through the AHB slave interface, the application controls the OTG\_HS controller. These registers are 32 bits wide, and the addresses are 32-bit block aligned. The OTG\_HS registers must be accessed by words (32 bits).

CSRs are classified as follows:

- Core global registers
- Host-mode registers
- Host global registers
- Host port CSRs
- Host channel-specific registers
- Device-mode registers
- Device global registers
- Device endpoint-specific registers
- Power and clock-gating registers
- Data FIFO (DFIFO) access registers

Only the core global, power and clock-gating, data FIFO access, and host port control and status registers can be accessed in both host and device modes. When the OTG\_HS controller is operating in one mode, either device or host, the application must not access registers from the other mode. If an illegal access occurs, a mode mismatch interrupt is generated and reflected in the core interrupt register (MMIS bit in the OTG\_GINTSTS register). When the core switches from one mode to the other, the registers in the new mode of operation must be reprogrammed as they would be after a power-on reset.

### 62.13.1 CSR memory map

The host and device mode registers occupy different addresses. All registers are implemented in the AHB clock domain.

#### Global CSR map

These registers are available in both host and device modes.

**Table 503. Core global control and status registers (CSRs)**

Acronym	Address offset	Register name
OTG_GOTGCTL	0x000	<a href="#">Section 62.14.1: OTG control and status register (OTG_GOTGCTL)</a>

**Data FIFO (DFIFO) access register map**

These registers, available in both host and device modes, are used to read or write the FIFO space for a specific endpoint or a channel, in a given direction. If a host channel is of type IN, the FIFO can only be read on the channel. Similarly, if a host channel is of type OUT, the FIFO can only be written on the channel.

**Table 506. Data FIFO (DFIFO) access register map**

FIFO access register section	Offset address	Access
Device IN endpoint 0/Host OUT Channel 0: DFIFO write access Device OUT endpoint 0/Host IN Channel 0: DFIFO read access	0x1000–0x1FFC	w r
Device IN endpoint 1/Host OUT Channel 1: DFIFO write access Device OUT endpoint 1/Host IN Channel 1: DFIFO read access	0x2000–0x2FFC	w r
...	...	...
Device IN endpoint x <sup>(1)</sup> /Host OUT Channel x <sup>(1)</sup> : DFIFO write access Device OUT endpoint x <sup>(1)</sup> /Host IN Channel x <sup>(1)</sup> : DFIFO read access	0xX000–0xXFFC	w r

1. Where x is 8 in device mode and 15 in host mode.

### Power and clock gating CSR map

There is a single register for power and clock gating. It is available in both host and device modes.

**Table 507. Power and clock gating control and status registers**

Acronym	Offset address	Register name
OTG_PCGCCTL	0xE00–0xE04	<a href="#">Section 62.14.66: OTG power and clock gating control register (OTG_PCGCCTL)</a>

## 62.14 OTG\_HS registers

These registers are available in both host and device modes, and do not need to be reprogrammed when switching between these modes.

Bit values in the register descriptions are expressed in binary unless otherwise specified.

### 62.14.1 OTG control and status register (OTG\_GOTGCTL)

Address offset: 0x000

Reset value: 0x0001 0000

The OTG\_GOTGCTL register controls the behavior and reflects the status of the OTG function of the core.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CUR MOD	OTG VER	BSVLD	ASVLD	DBCT	CID STS
										r	rW	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

			rW	rW	rW	rW	r	rW	rW	rW	rW	rW	rW	rW	r

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **CURMOD**: Current mode of operation

Indicates the current mode (host or device).

0: Device mode

1: Host mode

Bit 20 **OTGVER**: OTG version

Selects the OTG revision.

0: OTG Version 1.3. OTG1.3 is obsolete for new product development.

1: OTG Version 2.0. In this version the core supports only data line pulsing for SRP.

Bit 19 **BSVLD**: B-session valid

Indicates the device mode transceiver status.

0: B-session is not valid.

1: B-session is valid.

In OTG mode, the user can use this bit to determine if the device is connected or disconnected.

*Note: Only accessible in device mode.*

Bit 18 **ASVLD**: A-session valid

Indicates the host mode transceiver status.

0: A-session is not valid

1: A-session is valid

*Note: Only accessible in host mode.*

Bit 17 **DBCT**: Long/short debounce time

Indicates the debounce time of a detected connection.

0: Long debounce time, used for physical connections (100 ms + 2.5  $\mu$ s)

1: Short debounce time, used for soft connections (2.5  $\mu$ s)

*Note: Only accessible in host mode.*

Bit 16 **CIDSTS**: Connector ID status

Indicates the connector ID status on a connect event.

0: The OTG\_HS controller is in A-device mode

1: The OTG\_HS controller is in B-device mode

*Note: Accessible in both device and host modes.*

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **EHEN**: Embedded host enable

It is used to select between OTG A device state machine and embedded host state machine.

0: OTG A device state machine is selected

1: Embedded host state machine is selected

Bit 11 **DHNPEN**: Device HNP enabled

The application sets this bit when it successfully receives a SetFeature.SetHNPEnable command from the connected USB host.

0: HNP is not enabled in the application

1: HNP is enabled in the application

*Note: Only accessible in device mode.*

- Bit 10 **HSHNPEN**: host set HNP enable  
The application sets this bit when it has successfully enabled HNP (using the SetFeature.SetHNPEnable command) on the connected device.  
0: Host Set HNP is not enabled  
1: Host Set HNP is enabled  
*Note: Only accessible in host mode.*
- Bit 9 **HNPRQ**: HNP request  
The application sets this bit to initiate an HNP request to the connected USB host. The application can clear this bit by writing a 0 when the host negotiation success status change bit in the OTG\_GOTGINT register (HNSSCHG bit in OTG\_GOTGINT) is set. The core clears this bit when the HNSSCHG bit is cleared.  
0: No HNP request  
1: HNP request  
*Note: Only accessible in device mode.*
- Bit 8 **HNGSCS**: Host negotiation success  
The core sets this bit when host negotiation is successful. The core clears this bit when the HNP request (HNPRQ) bit in this register is set.  
0: Host negotiation failure  
1: Host negotiation success  
*Note: Only accessible in device mode.*
- Bit 7 **BVALOVAL**: B-peripheral session valid override value.  
This bit is used to set override value for Bvalid signal when BVALOEN bit is set.  
0: Bvalid value is '0' when BVALOEN = 1  
1: Bvalid value is '1' when BVALOEN = 1  
*Note: Only accessible in device mode.*
- Bit 6 **BVALOEN**: B-peripheral session valid override enable.  
This bit is used to enable/disable the software to override the Bvalid signal using the BVALOVAL bit.  
0: Override is disabled and Bvalid signal from the respective PHY selected is used internally by the core  
1: Internally Bvalid received from the PHY is overridden with BVALOVAL bit value  
*Note: Only accessible in device mode.*
- Bit 5 **AVALOVAL**: A-peripheral session valid override value.  
This bit is used to set override value for Avalid signal when AVALOEN bit is set.  
0: Avalid value is '0' when AVALOEN = 1  
1: Avalid value is '1' when AVALOEN = 1  
*Note: Only accessible in host mode.*
- Bit 4 **AVALOEN**: A-peripheral session valid override enable.  
This bit is used to enable/disable the software to override the Avalid signal using the AVALOVAL bit.  
0: Override is disabled and Avalid signal from the respective PHY selected is used internally by the core  
1: Internally Avalid received from the PHY is overridden with AVALOVAL bit value  
*Note: Only accessible in host mode.*

Bit 3 **VBVALOVAL**: V<sub>BUS</sub> valid override value.

This bit is used to set override value for vbusvalid signal when VBVALOEN bit is set.

0: vbusvalid value is '0' when VBVALOEN = 1

1: vbusvalid value is '1' when VBVALOEN = 1

*Note: Only accessible in host mode.*

Bit 2 **VBVALOEN**: V<sub>BUS</sub> valid override enable.

This bit is used to enable/disable the software to override the vbusvalid signal using the VBVALOVAL bit.

0: Override is disabled and vbusvalid signal from the respective PHY selected is used internally by the core

1: Internally vbusvalid received from the PHY is overridden with VBVALOVAL bit value

*Note: Only accessible in host mode.*

Bit 1 **SRQ**: Session request

The application sets this bit to initiate a session request on the USB. The application can clear this bit by writing a 0 when the host negotiation success status change bit in the OTG\_GOTGINT register (HNSSCHG bit in OTG\_GOTGINT) is set. The core clears this bit when the HNSSCHG bit is cleared.

If the user uses the USB 1.1 full-speed serial transceiver interface to initiate the session request, the application must wait until V<sub>BUS</sub> discharges to 0.2 V, after the B-session valid bit in this register (BSVLD bit in OTG\_GOTGCTL) is cleared.

0: No session request

1: Session request

*Note: Only accessible in device mode.*

Bit 0 **SRQSCS**: Session request success

The core sets this bit when a session request initiation is successful.

0: Session request failure

1: Session request success

*Note: Only accessible in device mode.*

### 62.14.2 OTG interrupt register (OTG\_GOTGINT)

Address offset: 0x04

Reset value: 0x0000 0000

The application reads this register whenever there is an OTG interrupt and clears the bits in this register to clear the OTG interrupt.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBC DNE	ADTO CHG	HNG DET	Res.

						rc_w1	rc_w1						rc_w1		

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **DBCONE**: Debounce done

The core sets this bit when the debounce is completed after the device connect. The application can start driving USB reset after seeing this interrupt. This bit is only valid when the HNP Capable or SRP Capable bit is set in the OTG\_GUSBCFG register (HNPCAP bit or SRPCAP bit in OTG\_GUSBCFG, respectively).

*Note: Only accessible in host mode.*

Bit 18 **ADTOCHG**: A-device timeout change

The core sets this bit to indicate that the A-device has timed out while waiting for the B-device to connect.

*Note: Accessible in both device and host modes.*

Bit 17 **HNGDET**: Host negotiation detected

The core sets this bit when it detects a host negotiation request on the USB.

*Note: Accessible in both device and host modes.*

Bits 16:10 Reserved, must be kept at reset value.

Bit 9 **HNSSCHG**: Host negotiation success status change

The core sets this bit on the success or failure of a USB host negotiation request. The application must read the host negotiation success bit of the OTG\_GOTGCTL register (HNGSCS bit in OTG\_GOTGCTL) to check for success or failure.

*Note: Accessible in both device and host modes.*

Bits 7:3 Reserved, must be kept at reset value.

Bit 8 **SRSSCHG**: Session request success status change

The core sets this bit on the success or failure of a session request. The application must read the session request success bit in the OTG\_GOTGCTL register (SRQSCS bit in OTG\_GOTGCTL) to check for success or failure.

*Note: Accessible in both device and host modes.*

Bit 2 **SEDET**: Session end detected

The core sets this bit to indicate that the level of the voltage on  $V_{BUS}$  is no longer valid for a B-Peripheral session when  $V_{BUS} < 0.8$  V.

*Note: Accessible in both device and host modes.*

Bits 1:0 Reserved, must be kept at reset value.

### 62.14.3 OTG AHB configuration register (OTG\_GAHBCFG)

Address offset: 0x008

Reset value: 0x0000 0000

This register can be used to configure the core after power-on or a change in mode. This register mainly contains AHB system-related configuration parameters. Do not change this register after the initial programming. The application must program this register before starting any transactions on either the AHB or the USB.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	PTXFE LVL	TXFE LVL	Res.	DMAEN	HBSTLEN[3:0]				GINT MSK
							rw	rw		rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **PTXFELVL**: Periodic Tx FIFO empty level

Indicates when the periodic Tx FIFO empty interrupt bit in the OTG\_GINTSTS register (PTXFE bit in OTG\_GINTSTS) is triggered.

- 0: PTXFE (in OTG\_GINTSTS) interrupt indicates that the Periodic Tx FIFO is half empty
- 1: PTXFE (in OTG\_GINTSTS) interrupt indicates that the Periodic Tx FIFO is completely empty

*Note: Only accessible in host mode.*

Bit 7 **TXFELVL**: Tx FIFO empty level

In device mode, this bit indicates when IN endpoint Transmit FIFO empty interrupt (TXFE in OTG\_DIEPINTx) is triggered:

- 0: The TXFE (in OTG\_DIEPINTx) interrupt indicates that the IN endpoint Tx FIFO is half empty
- 1: The TXFE (in OTG\_DIEPINTx) interrupt indicates that the IN endpoint Tx FIFO is completely empty

In host mode, this bit indicates when the nonperiodic Tx FIFO empty interrupt (NPTXFE bit in OTG\_GINTSTS) is triggered:

- 0: The NPTXFE (in OTG\_GINTSTS) interrupt indicates that the nonperiodic Tx FIFO is half empty
- 1: The NPTXFE (in OTG\_GINTSTS) interrupt indicates that the nonperiodic Tx FIFO is completely empty

Bit 6 Reserved, must be kept at reset value.

Bit 5 **DMAEN**: DMA enabled  
 0: The core operates in slave mode  
 1: The core operates in DMA mode

Bits 4:1 **HBSTLEN[3:0]**: Burst length/type  
 0000 Single: Bus transactions use single 32 bit accesses (not recommended)  
 0001 INCR: Bus transactions use unspecified length accesses (not recommended, uses the INCR AHB bus command)  
 0011 INCR4: Bus transactions target 4x 32 bit accesses  
 0101 INCR8: Bus transactions target 8x 32 bit accesses  
  
 0111 INCR16: Bus transactions based on 16x 32 bit accesses  
 Others: Reserved

Bit 0 **GINTMSK**: Global interrupt mask  
 The application uses this bit to mask or unmask the interrupt line assertion to itself. Irrespective of this bit's setting, the interrupt status registers are updated by the core.  
 0: Mask the interrupt assertion to the application.  
 1: Unmask the interrupt assertion to the application.

*Note: Accessible in both device and host modes.*

### 62.14.4 OTG USB configuration register (OTG\_GUSBCFG)

Address offset: 0x00C

Reset value: 0x0000 1400

This register can be used to configure the core after power-on or a changing to host mode or device mode. It contains USB and USB-PHY related configuration parameters. The application must program this register before starting any transactions on either the AHB or the USB. Do not make changes to this register after the initial programming.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r/w		r/w	r/w	r/w	r/w	r/w	r/w		r/w				r/w	r/w	r/w

- Bit 31 Reserved, must be kept at reset value.
- Bit 30 **FDMOD**: Force device mode  
Writing a 1 to this bit, forces the core to device mode irrespective of the OTG\_ID input pin.  
0: Normal mode  
1: Force device mode  
After setting the force bit, the application must wait at least 25 ms before the change takes effect.  
*Note: Accessible in both device and host modes.*
- Bit 29 **FHMOD**: Force host mode  
Writing a 1 to this bit, forces the core to host mode irrespective of the OTG\_ID input pin.  
0: Normal mode  
1: Force host mode  
After setting the force bit, the application must wait at least 25 ms before the change takes effect.  
*Note: Accessible in both device and host modes.*
- Bits 28:26 Reserved, must be kept at reset value.
- Bit 25 **ULPIIPD**: ULPI interface protect disable  
This bit controls the circuitry built in the PHY to protect the ULPI interface when the link tri-states stp and data. Any pull-up or pull-down resistors employed by this feature can be disabled. Refer to the ULPI specification for more details.  
0: Enables the interface protection circuit  
1: Disables the interface protection circuit
- Bit 24 **PTCI**: Indicator pass through  
This bit controls whether the complement output is qualified with the internal  $V_{BUS}$  valid comparator before being used in the  $V_{BUS}$  state in the RX CMD. Refer to the ULPI specification for more details.  
0: Complement Output signal is qualified with the Internal  $V_{BUS}$  valid comparator  
1: Complement Output signal is not qualified with the Internal  $V_{BUS}$  valid comparator
- Bit 23 **PCCI**: Indicator complement  
This bit controls the PHY to invert the ExternalVbusIndicator input signal, and generate the complement output. Refer to the ULPI specification for more details.  
0: PHY does not invert the ExternalVbusIndicator signal  
1: PHY inverts ExternalVbusIndicator signal
- Bit 22 **TSDPS**: TermSel DLine pulsing selection  
This bit selects utmi\_termselect to drive the data line pulse during SRP (session request protocol).  
0: Data line pulsing using utmi\_txvalid (default)  
1: Data line pulsing using utmi\_termsel
- Bit 21 **ULPIVBUSI**: ULPI external  $V_{BUS}$  indicator  
This bit indicates to the ULPI PHY to use an external  $V_{BUS}$  overcurrent indicator.  
0: PHY uses an internal  $V_{BUS}$  valid comparator  
1: PHY uses an external  $V_{BUS}$  valid comparator
- Bit 20 **ULPIVBUSD**: ULPI External  $V_{BUS}$  Drive  
This bit selects between internal or external supply to drive 5 V on  $V_{BUS}$ , in the ULPI PHY.  
0: PHY drives  $V_{BUS}$  using internal charge pump (default)  
1: PHY drives  $V_{BUS}$  using external supply.

- Bit 19 **ULPICSM**: ULPI clock SuspendM  
 This bit sets the ClockSuspendM bit in the interface control register on the ULPI PHY. This bit applies only in the serial and carkit modes.  
 0: PHY powers down the internal clock during suspend  
 1: PHY does not power down the internal clock
- Bit 18 **ULPIAR**: ULPI Auto-resume  
 This bit sets the AutoResume bit in the interface control register on the ULPI PHY.  
 0: PHY does not use AutoResume feature  
 1: PHY uses AutoResume feature
- Bit 17 **ULPIFSL**: ULPI FS/LS select  
 The application uses this bit to select the FS/LS serial interface for the ULPI PHY. This bit is valid only when the FS serial transceiver is selected on the ULPI PHY.  
 0: ULPI interface  
 1: ULPI FS/LS serial interface
- Bit 16 Reserved, must be kept at reset value.
- Bit 15 **PHYLPC**: PHY Low-power clock select  
 This bit selects either 480 MHz or 48 MHz (low-power) PHY mode. In FS and LS modes, the PHY can usually operate on a 48 MHz clock to save power.  
 0: 480 MHz internal PLL clock  
 1: 48 MHz external clock  
 In 480 MHz mode, the UTMI interface operates at either 60 or 30 MHz, depending on whether the 8- or 16-bit data width is selected. In 48 MHz mode, the UTMI interface operates at 48 MHz in FS and LS modes.
- Bit 14 Reserved, must be kept at reset value.
- Bits 13:10 **TRDT[3:0]**: USB turnaround time  
 These bits are used to set the turnaround time in PHY clocks. They must be configured according to [Table 508: TRDT values](#), depending on the application AHB frequency. Higher TRDT values allow stretching the USB response time to IN tokens in order to compensate for longer AHB read access latency to the data FIFO.  
*Note: Only accessible in device mode.*
- Bit 9 **HNPCAP**: HNP-capable  
 The application uses this bit to control the OTG\_HS controller's HNP capabilities.  
 0: HNP capability is not enabled.  
 1: HNP capability is enabled.  
*Note: Accessible in both device and host modes.*
- Bit 8 **SRPCAP**: SRP-capable  
 The application uses this bit to control the OTG\_HS controller's SRP capabilities. If the core operates as a non-SRP-capable B-device, it cannot request the connected A-device (host) to activate  $V_{BUS}$  and start a session.  
 0: SRP capability is not enabled.  
 1: SRP capability is enabled.  
*Note: Accessible in both device and host modes.*
- Bit 7 Reserved, must be kept at reset value.
- Bit 6 **PHYSEL**: Full speed serial transceiver mode select  
 0: USB 2.0 external ULPI high-speed PHY.  
 1: USB 1.1 full-speed serial mode.

- Bit 5 Reserved, must be kept at reset value.
- Bit 4 Reserved, must be kept at reset value.
- Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **TOCAL[2:0]**: FS timeout calibration

The number of PHY clocks that the application programs in this field is added to the full-speed interpacket timeout duration in the core to account for any additional delays introduced by the PHY. This can be required, because the delay introduced by the PHY in generating the line state condition can vary from one PHY to another.

The USB standard timeout value for full-speed operation is 16 to 18 (inclusive) bit times. The application must program this field based on the speed of enumeration. The number of bit times added per PHY clock is 0.25 bit times.

**Table 508. TRDT values**

AHB frequency range (MHz)		TRDT minimum value
Min	Max	
30	-	0x9

**62.14.5 OTG reset register (OTG\_GRSTCTL)**

Address offset: 0x10

Reset value: 0x8000 0000

The application uses this register to reset various hardware features inside the core.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
AHB IDL	DMAR EQ	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
r	r														
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	TXFNUM[4:0]					TXF FLSH	RXF FLSH	Res.	FCRST	PSRST	CSRST
					rw	rw	rw	rw	rw	rs	rs		rs	rs	rs

Bit 31 **AHBIDL**: AHB master idle

Indicates that the AHB master state machine is in the Idle condition.

*Note: Accessible in both device and host modes.*

Bit 30 **DMAREQ**: DMA request signal enabled

This bit indicates that the DMA request is in progress. Used for debug.

Bits 29:11 Reserved, must be kept at reset value.

Bits 10:6 **TXFNUM[4:0]**: Tx FIFO number

This is the FIFO number that must be flushed using the Tx FIFO Flush bit. This field must not be changed until the core clears the Tx FIFO Flush bit.

00000:

- Non-periodic Tx FIFO flush in host mode
- Tx FIFO 0 flush in device mode

00001:

- Periodic Tx FIFO flush in host mode
- Tx FIFO 1 flush in device mode

00010: Tx FIFO 2 flush in device mode

...

01111: Tx FIFO 15 flush in device mode

10000: Flush all the transmit FIFOs in device or host mode.

*Note: Accessible in both device and host modes.*

Bit 5 **TXFFLSH**: Tx FIFO flush

This bit selectively flushes a single or all transmit FIFOs, but cannot do so if the core is in the midst of a transaction.

The application must write this bit only after checking that the core is neither writing to the Tx FIFO nor reading from the Tx FIFO. Verify using these registers:

Read—NAK Effective interrupt ensures the core is not reading from the FIFO

Write—AHBIDL bit in OTG\_GRSTCTL ensures the core is not writing anything to the FIFO.

Flushing is normally recommended when FIFOs are reconfigured. FIFO flushing is also recommended during device endpoint disable. The application must wait until the core clears this bit before performing any operations. This bit takes eight clocks to clear, using the slower clock of phy\_clk or hclk.

*Note: Accessible in both device and host modes.*

Bit 4 **RXFFLSH**: Rx FIFO flush

The application can flush the entire Rx FIFO using this bit, but must first ensure that the core is not in the middle of a transaction.

The application must only write to this bit after checking that the core is neither reading from the Rx FIFO nor writing to the Rx FIFO.

The application must wait until the bit is cleared before performing any other operations. This bit requires 8 clocks (slowest of PHY or AHB clock) to clear.

*Note: Accessible in both device and host modes.*

Bit 3 Reserved, must be kept at reset value.

**Bit 2 FCRST:** Host frame counter reset

The application writes this bit to reset the (micro-)frame number counter inside the core. When the (micro-)frame counter is reset, the subsequent SOF sent out by the core has a frame number of 0.

When application writes '1' to the bit, it might not be able to read back the value as it gets cleared by the core in a few clock cycles.

*Note:* Only accessible in host mode.

**Bit 1 PSRST:** Partial soft reset

Resets the internal state machines but keeps the enumeration info. Could be used to recover some specific PHY errors.

*Note:* Accessible in both device and host modes.

**Bit 0 CSRST:** Core soft reset

Resets the HCLK and PHY clock domains as follows:

Clears the interrupts and all the CSR register bits except for the following bits:

- GATEHCLK bit in OTG\_PCGCCTL
- STPPCLK bit in OTG\_PCGCCTL
- FSLSPCS bits in OTG\_HCFG
- DSPD bit in OTG\_DCFG
- SDIS bit in OTG\_DCTL
- OTG\_GCCFG register

All module state machines (except for the AHB slave unit) are reset to the Idle state, and all the transmit FIFOs and the receive FIFO are flushed.

Any transactions on the AHB Master are terminated as soon as possible, after completing the last data phase of an AHB transfer. Any transactions on the USB are terminated immediately.

The application can write to this bit any time it wants to reset the core. This is a self-clearing bit and the core clears this bit after all the necessary logic is reset in the core, which can take several clocks, depending on the current state of the core. Once this bit has been cleared, the software must wait at least 3 PHY clocks before accessing the PHY domain (synchronization delay). The software must also check that bit 31 in this register is set to 1 (AHB Master is Idle) before starting any operation.

Typically, the software reset is used during software development and also when the user dynamically changes the PHY selection bits in the above listed USB configuration registers. When the user changes the PHY, the corresponding clock for the PHY is selected and used in the PHY domain. Once a new clock is selected, the PHY domain has to be reset for proper operation.

*Note:* Accessible in both device and host modes.

### 62.14.6 OTG core interrupt register (OTG\_GINTSTS)

Address offset: 0x014

Reset value: 0x0400 0020

This register interrupts the application for system-level events in the current mode (device mode or host mode).

Some of the bits in this register are valid only in host mode, while others are valid in device mode only. This register also indicates the current mode. To clear the interrupt status bits of the rc\_w1 type, the application must write 1 into the bit.

The FIFO status interrupts are read-only; once software reads from or writes to the FIFO while servicing these interrupts, FIFO interrupt conditions are cleared automatically.

The application must clear the OTG\_GINTSTS register at initialization before unmasking the interrupt bit to avoid any interrupts generated prior to initialization.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1			r	r	r	r	rc_w1	r	rc_w1	r

**Bit 31 WKUPINT:** Resume/remote wakeup detected interrupt  
 Wakeup interrupt during suspend(L2) or LPM(L1) state.  
 – During suspend(L2):  
 In device mode, this interrupt is asserted when a resume is detected on the USB. In host mode, this interrupt is asserted when a remote wakeup is detected on the USB.  
 – During LPM(L1):  
 This interrupt is asserted for either host initiated resume or device initiated remote wakeup on USB.

*Note: Accessible in both device and host modes.*

**Bit 30 SRQINT:** Session request/new session detected interrupt  
 In host mode, this interrupt is asserted when a session request is detected from the device. In device mode, this interrupt is asserted when V<sub>BUS</sub> is in the valid range for a B-peripheral device. Accessible in both device and host modes.

**Bit 29 DISCINT:** Disconnect detected interrupt  
 Asserted when a device disconnect is detected.  
*Note: Only accessible in host mode.*

**Bit 28 CIDSCHG:** Connector ID status change  
 The core sets this bit when there is a change in connector ID status.  
*Note: Accessible in both device and host modes.*

**Bit 27 LPMINT:** LPM interrupt

In device mode, this interrupt is asserted when the device receives an LPM transaction and responds with a non-ERRORed response.

In host mode, this interrupt is asserted when the device responds to an LPM transaction with a non-ERRORed response or when the host core has completed LPM transactions for the programmed number of times (RETRYCNT bit in OTG\_GLPMCFG).

This field is valid only if the LPMEN bit in OTG\_GLPMCFG is set to 1.

**Bit 26 PTXFE:** Periodic Tx FIFO empty

Asserted when the periodic transmit FIFO is either half or completely empty and there is space for at least one entry to be written in the periodic request queue. The half or completely empty status is determined by the periodic Tx FIFO empty level bit in the OTG\_GAHBCFG register (PTXFELVL bit in OTG\_GAHBCFG).

*Note:* Only accessible in host mode.

**Bit 25 HCINT:** Host channels interrupt

The core sets this bit to indicate that an interrupt is pending on one of the channels of the core (in host mode). The application must read the OTG\_HAINT register to determine the exact number of the channel on which the interrupt occurred, and then read the corresponding OTG\_HCINTx register to determine the exact cause of the interrupt. The application must clear the appropriate status bit in the OTG\_HCINTx register to clear this bit.

*Note:* Only accessible in host mode.

**Bit 24 HPRTINT:** Host port interrupt

The core sets this bit to indicate a change in port status of one of the OTG\_HS controller ports in host mode. The application must read the OTG\_HPRT register to determine the exact event that caused this interrupt. The application must clear the appropriate status bit in the OTG\_HPRT register to clear this bit.

*Note:* Only accessible in host mode.

**Bit 23 RSTDET:** Reset detected interrupt

In device mode, this interrupt is asserted when a reset is detected on the USB in partial power-down mode when the device is in suspend.

*Note:* Only accessible in device mode.

**Bit 22 DATAFSUSP:** Data fetch suspended

This interrupt is valid only in DMA mode. This interrupt indicates that the core has stopped fetching data for IN endpoints due to the unavailability of TxFIFO space or request queue space. This interrupt is used by the application for an endpoint mismatch algorithm. For example, after detecting an endpoint mismatch, the application:

- Sets a global nonperiodic IN NAK handshake
- Disables IN endpoints
- Flushes the FIFO
- Determines the token sequence from the IN token sequence learning queue
- Re-enables the endpoints

Clears the global nonperiodic IN NAK handshake If the global nonperiodic IN NAK is cleared, the core has not yet fetched data for the IN endpoint, and the IN token is received: the core generates an “IN token received when FIFO empty” interrupt. The OTG then sends a NAK response to the host. To avoid this scenario, the application can check the FetSusp interrupt in OTG\_GINTSTS, which ensures that the FIFO is full before clearing a global NAK handshake. Alternatively, the application can mask the “IN token received when FIFO empty” interrupt when clearing a global IN NAK handshake.

- Bit 21 **IPXFR**: Incomplete periodic transfer  
In host mode, the core sets this interrupt bit when there are incomplete periodic transactions still pending, which are scheduled for the current frame.
- INCOMPISOOUT**: Incomplete isochronous OUT transfer  
In device mode, the core sets this interrupt to indicate that there is at least one isochronous OUT endpoint on which the transfer is not completed in the current frame. This interrupt is asserted along with the End of periodic frame interrupt (EOPF) bit in this register.
- Bit 20 **ISOIXFR**: Incomplete isochronous IN transfer  
The core sets this interrupt to indicate that there is at least one isochronous IN endpoint on which the transfer is not completed in the current frame. This interrupt is asserted along with the End of periodic frame interrupt (EOPF) bit in this register.  
*Note: Only accessible in device mode.*
- Bit 19 **OEPINT**: OUT endpoint interrupt  
The core sets this bit to indicate that an interrupt is pending on one of the OUT endpoints of the core (in device mode). The application must read the OTG\_DAIN register to determine the exact number of the OUT endpoint on which the interrupt occurred, and then read the corresponding OTG\_DOEPINTx register to determine the exact cause of the interrupt. The application must clear the appropriate status bit in the corresponding OTG\_DOEPINTx register to clear this bit.  
*Note: Only accessible in device mode.*
- Bit 18 **IEPINT**: IN endpoint interrupt  
The core sets this bit to indicate that an interrupt is pending on one of the IN endpoints of the core (in device mode). The application must read the OTG\_DAIN register to determine the exact number of the IN endpoint on which the interrupt occurred, and then read the corresponding OTG\_DIEPINTx register to determine the exact cause of the interrupt. The application must clear the appropriate status bit in the corresponding OTG\_DIEPINTx register to clear this bit.  
*Note: Only accessible in device mode.*
- Bits 17:16 Reserved, must be kept at reset value.
- Bit 15 **EOPF**: End of periodic frame interrupt  
Indicates that the period specified in the periodic frame interval field of the OTG\_DCFG register (PFIVL bit in OTG\_DCFG) has been reached in the current frame.  
*Note: Only accessible in device mode.*
- Bit 14 **ISOODRP**: Isochronous OUT packet dropped interrupt  
The core sets this bit when it fails to write an isochronous OUT packet into the Rx FIFO because the Rx FIFO does not have enough space to accommodate a maximum size packet for the isochronous OUT endpoint.  
*Note: Only accessible in device mode.*
- Bit 13 **ENUMDNE**: Enumeration done  
The core sets this bit to indicate that speed enumeration is complete. The application must read the OTG\_DSTS register to obtain the enumerated speed.  
*Note: Only accessible in device mode.*
- Bit 12 **USBRST**: USB reset  
The core sets this bit to indicate that a reset is detected on the USB.  
*Note: Only accessible in device mode.*

**Bit 11 USBSUSP:** USB suspend

The core sets this bit to indicate that a suspend was detected on the USB. The core enters the suspended state when there is no activity on the data lines for an extended period of time.

*Note: Only accessible in device mode.*

**Bit 10 ESUSP:** Early suspend

The core sets this bit to indicate that an Idle state has been detected on the USB for 3 ms.

*Note: Only accessible in device mode.*

Bits 9:8 Reserved, must be kept at reset value.

**Bit 7 GONAKEFF:** Global OUT NAK effective

Indicates that the Set global OUT NAK bit in the OTG\_DCTL register (SGONAK bit in OTG\_DCTL), set by the application, has taken effect in the core. This bit can be cleared by writing the Clear global OUT NAK bit in the OTG\_DCTL register (CGONAK bit in OTG\_DCTL).

*Note: Only accessible in device mode.*

**Bit 6 GINAKEFF:** Global IN non-periodic NAK effective

Indicates that the Set global non-periodic IN NAK bit in the OTG\_DCTL register (SGINAK bit in OTG\_DCTL), set by the application, has taken effect in the core. That is, the core has sampled the Global IN NAK bit set by the application. This bit can be cleared by clearing the Clear global non-periodic IN NAK bit in the OTG\_DCTL register (CGINAK bit in OTG\_DCTL).

This interrupt does not necessarily mean that a NAK handshake is sent out on the USB. The STALL bit takes precedence over the NAK bit.

*Note: Only accessible in device mode.*

**Bit 5 NPTXFE:** Non-periodic Tx FIFO empty

This interrupt is asserted when the non-periodic Tx FIFO is either half or completely empty, and there is space for at least one entry to be written to the non-periodic transmit request queue. The half or completely empty status is determined by the non-periodic Tx FIFO empty level bit in the OTG\_GAHBCFG register (TXFELVL bit in OTG\_GAHBCFG).

*Note: Accessible in host mode only.*

**Bit 4 RXFLVL:** Rx FIFO non-empty

Indicates that there is at least one packet pending to be read from the Rx FIFO.

*Note: Accessible in both host and device modes.*

**Bit 3 SOF:** Start of frame

In host mode, the core sets this bit to indicate that an SOF (FS), or Keep-Alive (LS) is transmitted on the USB. The application must write a 1 to this bit to clear the interrupt.

In device mode, the core sets this bit to indicate that an SOF token has been received on the USB. The application can read the OTG\_DSTS register to get the current frame number. This interrupt is seen only when the core is operating in FS.

*Note: This register may return '1' if read immediately after power on reset. If the register bit reads '1' immediately after power on reset it does not indicate that an SOF has been sent (in case of host mode) or SOF has been received (in case of device mode). The read value of this interrupt is valid only after a valid connection between host and device is established. If the bit is set after power on reset the application can clear the bit.*

*Note: Accessible in both host and device modes.*

Bit 2 **OTGINT**: OTG interrupt

The core sets this bit to indicate an OTG protocol event. The application must read the OTG interrupt status (OTG\_GOTGINT) register to determine the exact event that caused this interrupt. The application must clear the appropriate status bit in the OTG\_GOTGINT register to clear this bit.

*Note: Accessible in both host and device modes.*

Bit 1 **MMIS**: Mode mismatch interrupt

The core sets this bit when the application is trying to access:

- A host mode register, when the core is operating in device mode
- A device mode register, when the core is operating in host mode

The register access is completed on the AHB with an OKAY response, but is ignored by the core internally and does not affect the operation of the core.

*Note: Accessible in both host and device modes.*

Bit 0 **CMOD**: Current mode of operation

Indicates the current mode.

- 0: Device mode
- 1: Host mode

*Note: Accessible in both host and device modes.*

### 62.14.7 OTG interrupt mask register (OTG\_GINTMSK)

Address offset: 0x018

Reset value: 0x0000 0000

This register works with the core interrupt register to interrupt the application. When an interrupt bit is masked, the interrupt associated with that bit is not generated. However, the core interrupt (OTG\_GINTSTS) register bit corresponding to that interrupt is still set.

### 62.14.8 OTG receive status debug read register (OTG\_GRXSTSR)

Address offset for read: 0x01C

Reset value: 0x0000 0000

This description is for register OTG\_GRXSTSR in Device mode.

A read to the receive status debug read register returns the contents of the top of the receive FIFO.

The core ignores the receive status read when the receive FIFO is empty and returns a value of 0x0000 0000.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **STSPHST**: Status phase start

Indicates the start of the status phase for a control write transfer. This bit is set along with the OUT transfer completed PKTSTS pattern.

Bits 26:25 Reserved, must be kept at reset value.

Bits 24:21 **FRMNUM[3:0]**: Frame number

This is the least significant 4 bits of the frame number in which the packet is received on the USB. This field is supported only when isochronous OUT endpoints are supported.

Bits 20:17 **PKTSTS[3:0]**: Packet status

Indicates the status of the received packet  
 0001: Global OUT NAK (triggers an interrupt)  
 0010: OUT data packet received  
 0011: OUT transfer completed (triggers an interrupt)  
 0100: SETUP transaction completed (triggers an interrupt)  
 0110: SETUP data packet received  
 Others: Reserved

Bits 16:15 **DPID[1:0]**: Data PID

Indicates the data PID of the received OUT data packet  
 00: DATA0  
 10: DATA1  
 01: DATA2  
 11: MDATA

Bits 14:4 **BCNT[10:0]**: Byte count

Indicates the byte count of the received data packet.

Bits 3:0 **EPNUM[3:0]**: Endpoint number

Indicates the endpoint number to which the current received packet belongs.

**62.14.9 OTG receive status debug read [alternate] (OTG\_GRXSTSR)**

Address offset for read: 0x01C

Reset value: 0x0000 0000

This description is for register OTG\_GRXSTSR in Host mode.

A read to the receive status debug read register returns the contents of the top of the receive FIFO.

The core ignores the receive status read when the receive FIFO is empty and returns a value of 0x0000 0000.

DPID	BCNT[10:0]										CHNUM[3:0]				
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:17 **PKTSTS[3:0]**: Packet status

- Indicates the status of the received packet
- 0010: IN data packet received
- 0011: IN transfer completed (triggers an interrupt)
- 0101: Data toggle error (triggers an interrupt)
- 0111: Channel halted (triggers an interrupt)
- Others: Reserved

Bits 16:15 **DPID[1:0]**: Data PID

- Indicates the data PID of the received packet
- 00: DATA0
- 10: DATA1
- 01: DATA2
- 11: MDATA

Bits 14:4 **BCNT[10:0]**: Byte count

Indicates the byte count of the received IN data packet.

Bits 3:0 **CHNUM[3:0]**: Channel number

Indicates the channel number to which the current received packet belongs.

### 62.14.10 OTG status read and pop registers (OTG\_GRXSTSP)

Address offset for pop: 0x020

Reset value: 0x0000 0000

This description is for register OTG\_GRXSTSP in Device mode.

Similarly to OTG\_GRXSTSR (receive status debug read register) where a read returns the contents of the top of the receive FIFO, a read to OTG\_GRXSTSP (receive status read and pop register) additionally pops the top data entry out of the Rx FIFO.

The core ignores the receive status pop/read when the receive FIFO is empty and returns a value of 0x0000 0000. The application must only pop the receive status FIFO when the receive FIFO non-empty bit of the core interrupt register (RXFLVL bit in OTG\_GINTSTS) is asserted.

DPID[0]	BCNT[10:0]										EPNUM[3:0]				
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **STSPHST**: Status phase start

Indicates the start of the status phase for a control write transfer. This bit is set along with the OUT transfer completed PKTSTS pattern.

Bits 26:25 Reserved, must be kept at reset value.

Bits 24:21 **FRMNUM[3:0]**: Frame number

This is the least significant 4 bits of the frame number in which the packet is received on the USB. This field is supported only when isochronous OUT endpoints are supported.

Bits 20:17 **PKTSTS[3:0]**: Packet status

- Indicates the status of the received packet
- 0001: Global OUT NAK (triggers an interrupt)
- 0010: OUT data packet received
- 0011: OUT transfer completed (triggers an interrupt)
- 0100: SETUP transaction completed (triggers an interrupt)
- 0110: SETUP data packet received
- Others: Reserved

Bits 16:15 **DPID[1:0]**: Data PID  
 Indicates the data PID of the received OUT data packet  
 00: DATA0  
 10: DATA1  
 01: DATA2  
 11: MDATA

Bits 14:4 **BCNT[10:0]**: Byte count  
 Indicates the byte count of the received data packet.

Bits 3:0 **EPNUM[3:0]**: Endpoint number  
 Indicates the endpoint number to which the current received packet belongs.

### 62.14.11 OTG status read and pop registers [alternate] (OTG\_GRXSTSP)

Address offset for pop: 0x020

Reset value: 0x0000 0000

This description is for register OTG\_GRXSTSP in Host mode.

Similarly to OTG\_GRXSTSR (receive status debug read register) where a read returns the contents of the top of the receive FIFO, a read to OTG\_GRXSTSP (receive status read and pop register) additionally pops the top data entry out of the Rx FIFO.

The core ignores the receive status pop/read when the receive FIFO is empty and returns a value of 0x0000 0000. The application must only pop the receive status FIFO when the receive FIFO non-empty bit of the core interrupt register (RXFLVL bit in OTG\_GINTSTS) is asserted.

**Host mode**

Bits 31:16 **NPTXFD[15:0]**: Non-periodic Tx FIFO depth  
 This value is in terms of 32-bit words.  
 Minimum value is 16  
 Programmed values must respect the available FIFO memory allocation and must not exceed the power-on value.

Bits 15:0 **NPTXFSA[15:0]**: Non-periodic transmit RAM start address  
 This field configures the memory start address for non-periodic transmit FIFO RAM.

**Device mode**

Bits 31:16 **TX0FD**: Endpoint 0 Tx FIFO depth  
 This value is in terms of 32-bit words.  
 Minimum value is 16  
 Programmed values must respect the available FIFO memory allocation and must not exceed the power-on value.

Bits 15:0 **TX0FSA**: Endpoint 0 transmit RAM start address  
 This field configures the memory start address for the endpoint 0 transmit FIFO RAM.

**62.14.14 OTG non-periodic transmit FIFO/queue status register (OTG\_HNPTXSTS)**

Address offset: 0x02C

Reset value: 0x0008 0400

*Note:* In device mode, this register is not valid.

This read-only register contains the free space information for the non-periodic Tx FIFO and the non-periodic transmit request queue.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 30:24 **NPTXQTOP[6:0]**: Top of the non-periodic transmit request queue

Entry in the non-periodic Tx request queue that is currently being processed by the MAC.

Bits 30:27: Channel/endpoint number

Bits 26:25:

00: IN/OUT token

01: Zero-length transmit packet (device IN/host OUT)

11: Channel halt command

Bit 24: Terminate (last entry for selected channel/endpoint)

Bits 23:16 **NPTQXSAV[7:0]**: Non-periodic transmit request queue space available

Indicates the amount of free space available in the non-periodic transmit request queue.

This queue holds both IN and OUT requests.

0: Non-periodic transmit request queue is full

1: 1 location available

2: locations available

n: n locations available (0 ≤ n ≤ 8)

Others: Reserved

Bits 15:0 **NPTXFSAV[15:0]**: Non-periodic Tx FIFO space available

Indicates the amount of free space available in the non-periodic Tx FIFO.

Values are in terms of 32-bit words.

0: Non-periodic Tx FIFO is full

1: 1 word available

2: 2 words available

n: n words available (where 0 ≤ n ≤ 512)

Others: Reserved

### 62.14.15 OTG general core configuration register (OTG\_GCCFG)

Address offset: 0x038

Reset value: 0x0000 XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VB DEN	SD EN	PD EN	DCD EN	BC DEN	PWR DWN
										rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PS2 DET	SDET	PDET	DCDET
												r	r	r	r

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **VBDEN**: USB  $V_{BUS}$  detection enable

Enables  $V_{BUS}$  sensing comparators to detect  $V_{BUS}$  valid levels on the  $V_{BUS}$  PAD for USB host and device operation. If HNP and/or SRP support is enabled,  $V_{BUS}$  comparators are automatically enabled independently of VBDEN value.

0 =  $V_{BUS}$  detection disabled

1 =  $V_{BUS}$  detection enabled

Bit 20 **SDEN**: Secondary detection (SD) mode enable

This bit is set by the software to put the BCD into SD mode. Only one detection mode (DCD, PD, SD or OFF) should be selected to work correctly

Bit 19 **PDEN**: Primary detection (PD) mode enable

This bit is set by the software to put the BCD into PD mode. Only one detection mode (DCD, PD, SD or OFF) should be selected to work correctly.

Bit 18 **DCDEN**: Data contact detection (DCD) mode enable

This bit is set by the software to put the BCD into DCD mode. Only one detection mode (DCD, PD, SD or OFF) should be selected to work correctly.

Bit 17 **BCDEN**: Battery charging detector (BCD) enable

This bit is set by the software to enable the BCD support within the USB device. When enabled, the USB PHY is fully controlled by BCD and cannot be used for normal communication. Once the BCD discovery is finished, the BCD should be placed in OFF mode by clearing this bit to '0' in order to allow the normal USB operation.

Bit 16 **PWRDWN**: Power down control of FS PHY

Used to activate the FS PHY in transmission/reception. When reset, the PHY is kept in power-down. When set, the BCD function must be off (BCDEN=0).

0 = USB FS PHY disabled

1 = USB FS PHY enabled

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **PS2DET**: DM pull-up detection status

This bit is active only during PD and gives the result of comparison between DM voltage level and VLGC threshold. In normal situation, the DM level should be below this threshold. If it is above, it means that the DM is externally pulled high. This can be caused by connection to a PS2 port (which pulls-up both DP and DM lines) or to some proprietary charger not following the BCD specification.

0: Normal port detected (connected to SDP, CDP or DCP)

1: PS2 port or proprietary charger detected

Bit 2 **SDET**: Secondary detection (SD) status

This bit gives the result of SD.

0: CDP detected

1: DCP detected

Bit 1 **PDET**: Primary detection (PD) status

This bit gives the result of PD.

0: no BCD support detected (connected to SDP or proprietary device).

1: BCD support detected (connected to CDP or DCP).

Bit 0 **DCDET**: Data contact detection (DCD) status

This bit gives the result of DCD.

0: data lines contact not detected

1: data lines contact detected

### 62.14.16 OTG core ID register (OTG\_CID)

Address offset: 0x03C

Reset value: 0x0000 2300

This is a register containing the Product ID as reset value.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PRODUCT_ID[31:16]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PRODUCT_ID[15:0]

Bits 31:0 **PRODUCT\_ID[31:0]**: Product ID field  
Application-programmable ID field.

### 62.14.17 OTG core LPM configuration register (OTG\_GLPMCFG)

Address offset: 0x54

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	EN BESL	LPMRCNTSTS[2:0]			SND LPM	LPMRCNT[2:0]			LPMCHIDX[3:0]			L1RSM OK	
			r/w	r	r	r	rs	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SLP STS	LPMRSP[1:0]		L1DS EN	BESLTHRS[3:0]				L1SS EN	REM WAKE	BESL[3:0]				LPM ACK	LPM EN
r	r	r	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **ENBESL**: Enable best effort service latency

This bit enables the BESL feature as defined in the LPM errata:

0: The core works as described in the following document:

*USB 2.0 Link Power Management Addendum Engineering Change Notice to the USB 2.0 specification, July 16, 2007*

1: The core works as described in the LPM Errata:

*Errata for USB 2.0 ECN: Link Power Management (LPM) - 7/2007*

*Note: Only the updated behavior (described in LPM Errata) is considered in this document and so the ENBESL bit should be set to '1' by application SW.*

Bits 27:25 **LPMRCNTSTS[2:0]**: LPM retry count status

Number of LPM host retries still remaining to be transmitted for the current LPM sequence.

*Note: Accessible only in host mode.*

Bit 24 **SNDLPM**: Send LPM transaction

When the application software sets this bit, an LPM transaction containing two tokens, EXT and LPM is sent. The hardware clears this bit once a valid response (STALL, NYET, or ACK) is received from the device or the core has finished transmitting the programmed number of LPM retries.

*Note: This bit must be set only when the host is connected to a local port.*

*Note: Accessible only in host mode.*

Bits 23:21 **LPMRCNT[2:0]**: LPM retry count

When the device gives an ERROR response, this is the number of additional LPM retries that the host performs until a valid device response (STALL, NYET, or ACK) is received.

*Note: Accessible only in host mode.*

Bits 20:17 **LPMCHIDX[3:0]**: LPM Channel Index

The channel number on which the LPM transaction has to be applied while sending an LPM transaction to the local device. Based on the LPM channel index, the core automatically inserts the device address and endpoint number programmed in the corresponding channel into the LPM transaction.

*Note: Accessible only in host mode.*

Bit 16 **L1RSMOK**: Sleep state resume OK

Indicates that the device or host can start resume from Sleep state. This bit is valid in LPM sleep (L1) state. It is set in sleep mode after a delay of 50  $\mu$ s ( $T_{L1Residency}$ ).

This bit is reset when SLPSTS is 0.

1: The application or host can start resume from Sleep state

0: The application or host cannot start resume from Sleep state

Bit 15 **SLPSTS**: Port sleep status**Device mode:**

This bit is set as long as a Sleep condition is present on the USB bus. The core enters the Sleep state when an ACK response is sent to an LPM transaction and the  $T_{L1TokenRetry}$  timer has expired. To stop the PHY clock, the application must set the STPPCLK bit in OTG\_PCGCTL, which asserts the PHY suspend input signal.

The application must rely on SLPSTS and not ACK in LPMRSP to confirm transition into sleep.

The core comes out of sleep:

- When there is any activity on the USB linestate
- When the application writes to the RWUSIG bit in OTG\_DCTL or when the application resets or soft-disconnects the device.

**Host mode:**

The host transitions to Sleep (L1) state as a side-effect of a successful LPM transaction by the core to the local port with ACK response from the device. The read value of this bit reflects the current Sleep status of the port.

The core clears this bit after:

- The core detects a remote L1 wakeup signal,
- The application sets the PRST bit or the PRES bit in the OTG\_HPRT register, or
- The application sets the L1Resume/ remote wakeup detected interrupt bit or disconnect detected interrupt bit in the core interrupt register (WKUPINT or DISCINT bit in OTG\_GINTSTS, respectively).

0: Core not in L1

1: Core in L1

Bits 14:13 **LPMRSP[1:0]**: LPM response

**Device mode:**

The response of the core to LPM transaction received is reflected in these two bits.

**Host mode:**

Handshake response received from local device for LPM transaction

11: ACK

10: NYET

01: STALL

00: ERROR (No handshake response)

Bit 12 **L1DSEN**: L1 deep sleep enable

Enables suspending the PHY in L1 Sleep mode. For maximum power saving during L1 Sleep mode, this bit should be set to '1' by application SW in all the cases.

Bits 11:8 **BESLTHRS[3:0]**: BESL threshold

**Device mode:**

The core puts the PHY into deep low power mode in L1 when BESL value is greater than or equal to the value defined in this field BESL\_Thres[3:0].

**Host mode:**

The core puts the PHY into deep low power mode in L1. BESLTHRS[3:0] specifies the time for which resume signaling is to be reflected by host ( $T_{L1HubDrvResume2}$ ) on the USB bus when it detects device initiated resume.

BESLTHRS must not be programmed with a value greater than 1100b in host mode, because this exceeds maximum  $T_{L1HubDrvResume2}$ .

Thres[3:0] host mode resume signaling time ( $\mu$ s):

0000: 75

0001: 100

0010: 150

0011: 250

0100: 350

0101: 450

0110: 950

All other values: reserved

Bit 7 **L1SSEN**: L1 Shallow Sleep enable

Enables suspending the PHY in L1 Sleep mode. For maximum power saving during L1 Sleep mode, this bit should be set to '1' by application SW in all the cases.

Bit 6 **REMWAKE**: bRemoteWake value

**Host mode:**

The value of remote wake up to be sent in the wIndex field of LPM transaction.

**Device mode (read-only):**

This field is updated with the received LPM token bRemoteWake bmAttribute when an ACK, NYET, or STALL response is sent to an LPM transaction.

Bits 5:2 **BESL[3:0]**: Best effort service latency

**Host mode:**

The value of BESL to be sent in an LPM transaction. This value is also used to initiate resume for a duration  $T_{L1HubDrvResume1}$  for host initiated resume.

**Device mode (read-only):**

This field is updated with the received LPM token BESL bmAttribute when an ACK, NYET, or STALL response is sent to an LPM transaction.

BESL[3:0] $T_{BESL}$  ( $\mu$ s)

0000: 125  
 0001: 150  
 0010: 200  
 0011: 300  
 0100: 400  
 0101: 500  
 0110: 1000  
 0111: 2000  
 1000: 3000  
 1001: 4000  
 1010: 5000  
 1011: 6000  
 1100: 7000  
 1101: 8000  
 1110: 9000  
 1111: 10000

Bit 1 **LPMACK**: LPM token acknowledge enable

Handshake response to LPM token preprogrammed by device application software.

1: ACK

Even though ACK is preprogrammed, the core device responds with ACK only on successful LPM transaction. The LPM transaction is successful if:

- No PID/CRC5 errors in either EXT token or LPM token (else ERROR)
- Valid bLinkState = 0001B (L1) received in LPM transaction (else STALL)
- No data pending in transmit queue (else NYET).

0: NYET

The preprogrammed software bit is over-ridden for response to LPM token when:

- The received bLinkState is not L1 (STALL response), or
- An error is detected in either of the LPM token packets because of corruption (ERROR response).

*Note: Accessible only in device mode.*

Bit 0 **LPMEN**: LPM support enable

The application uses this bit to control the OTG\_HS core LPM capabilities.

If the core operates as a non-LPM-capable host, it cannot request the connected device or hub to activate LPM mode.

If the core operates as a non-LPM-capable device, it cannot respond to any LPM transactions.

0: LPM capability is not enabled

1: LPM capability is enabled

**62.14.18 OTG host periodic transmit FIFO size register (OTG\_HPTXFSIZ)**

Address offset: 0x100

Reset value: 0x0400 0800

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

PTXSA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **PTXFSIZ[15:0]**: Host periodic Tx FIFO depth

This value is in terms of 32-bit words.

Minimum value is 16

Bits 15:0 **PTXSA[15:0]**: Host periodic Tx FIFO start address

This field configures the memory start address for periodic transmit FIFO RAM.

**62.14.19 OTG device IN endpoint transmit FIFO x size register (OTG\_DIEPTFX)**

Address offset: 0x104 + 0x04 \* (x - 1), (x = 1 to 8)

Reset value: Block 1: 0x0200 0400

INEPTXSA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **INEPTXFD[15:0]**: IN endpoint Tx FIFO depth  
 This value is in terms of 32-bit words.  
 Minimum value is 16

Bits 15:0 **INEPTXSA[15:0]**: IN endpoint FIFOx transmit RAM start address  
 This field contains the memory start address for IN endpoint transmit FIFOx. The address must be aligned with a 32-bit memory location.

### 62.14.20 Host-mode registers

Bit values in the register descriptions are expressed in binary unless otherwise specified.

Host-mode registers affect the operation of the core in the host mode. Host mode registers must not be accessed in device mode, as the results are undefined. Host mode registers can be categorized as follows:

### 62.14.21 OTG host configuration register (OTG\_HCFG)

Address offset: 0x400

Reset value: 0x0000 0000

This register configures the core after power-on. Do not make changes to this register after initializing the host.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	PERSS CHEDE NA	FRLSTEN[1:0]		DESCD MA	Res.	Res.	Res.	Res.	Res.	Res.	Res.
					rw	rw	rw	rw							
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FSLSS	FSLSPCS[1:0]	
													r	rw	rw

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **PERSSCHEDENA**: Enable periodic scheduling  
 Applicable in host scatter/gather DMA mode only. Enables periodic scheduling within the core. Initially, the bit is res and the core does not process any periodic channels. As soon as this bit is set, the core gets ready to start scheduling periodic channels and sets OTG\_HCFG.PERSCHESTAT. The setting of PERSCHESTAT indicates the core has enabled periodic scheduling. Once PERSSCHEDENA is set, the application is not supposed to reset the bit unless PERSCHESTAT is set. As soon as this bit is reset, the core gets ready to stop scheduling periodic channels and resets HCFG. PerSchedStat. In non-Scatter/Gather DMA mode, this bit is reserved.

Bits 25:24 **FRLSTEN[1:0]**: Frame list entries  
 The value in the register specifies the number of entries in the Frame list. This field is valid only in Scatter/Gather DMA mode.  
 2'b00: Reserved  
 2'b01: 8 Entries  
 2'b10: 16 Entries  
 2'b11: 32 Entries In non-Scatter/Gather

Bit 23 **DESCDMA**: Enable scatter/gather DMA in host mode

The application can set this bit during initialization to enable the Scatter/Gather DMA operation. This bit must be modified only once after a reset. The following combinations are available for programming:

- OTG\_GAHBCFG.DMAEN=0,OTG\_HCFG.DESCDMA=0 => Slave mode
- OTG\_GAHBCFG.DMAEN=0,OTG\_HCFG.DESCDMA=1 => Invalid
- OTG\_GAHBCFG.DMAEN=1,OTG\_HCFG.DESCDMA=0 => Buffered DMA mode
- OTG\_GAHBCFG.DMAEN=1,OTG\_HCFG.DESCDMA=1 => Scatter/Gather DMA mode

Bits 22:3 Reserved, must be kept at reset value.

Bit 2 **FSLSS**: FS- and LS-only support

The application uses this bit to control the core's enumeration speed. Using this bit, the application can make the core enumerate as an FS host, even if the connected device supports HS traffic. Do not make changes to this field after initial programming.

Bits 1:0 **FSLSPCS[1:0]**: FS/LS PHY clock select

When the core is in FS host mode

01: PHY clock is running at 48 MHz

Others: Reserved

When the core is in LS host mode

00: Reserved

01: Select 48 MHz PHY clock frequency

10: Select 6 MHz PHY clock frequency

11: Reserved

*Note: The FSLSPCS must be set on a connection event according to the speed of the connected device (after changing this bit, a software reset must be performed).*

### 62.14.22 OTG host frame interval register (OTG\_HFIR)

Address offset: 0x404

Reset value: 0x0000 EA60

This register stores the frame interval information for the current speed to which the OTG\_HS controller has enumerated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RLD CTRL
															rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FRIVL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **RLDCTRL**: Reload control

This bit allows dynamic reloading of the HFIR register during run time.

0: The HFIR cannot be reloaded dynamically

1: The HFIR can be dynamically reloaded during run time.

This bit needs to be programmed during initial configuration and its value must not be changed during run time.

**Caution:** RLDCTRL = 0 is not recommended.

Bits 15:0 **FRIVL[15:0]**: Frame interval

The value that the application programs to this field, specifies the interval between two consecutive micro-SOFs (HS) or Keep-Alive tokens (LS). This field contains the number of PHY clocks that constitute the required frame interval. The application can write a value to this register only after the port enable bit of the host port control and status register (PENA bit in OTG\_HPRT) has been set. If no value is programmed, the core calculates the value based on the PHY clock specified in the FS/LS PHY clock select field of the host configuration register (FSLSPCS in OTG\_HCFG). Do not change the value of this field after the initial configuration, unless the RLDCTRL bit is set. In such case, the FRIVL is reloaded with each SOF event.

- Frame interval = 125 μs × (FRIVL - 1) in high speed operation
- Frame interval = 1 ms × (FRIVL - 1) in low/full speed operation

### 62.14.23 OTG host frame number/frame time remaining register (OTG\_HFNUM)

Address offset: 0x408

Reset value: 0x0000 3FFF

This register indicates the current frame number. It also indicates the time remaining (in terms of the number of PHY clocks) in the current frame.

Bits 31:16 **FTREM[15:0]**: Frame time remaining

Indicates the amount of time remaining in the current frame, in terms of PHY clocks. This field decrements on each PHY clock. When it reaches zero, this field is reloaded with the value in the Frame interval register and a new SOF is transmitted on the USB.

Bits 15:0 **FRNUM[15:0]**: Frame number

This field increments when a new SOF is transmitted on the USB, and is cleared to 0 when it reaches 0x3FFF.

### 62.14.24 OTG\_Host periodic transmit FIFO/queue status register (OTG\_HPTXSTS)

Address offset: 0x410

Reset value: 0x0008 0100

This read-only register contains the free space information for the periodic Tx FIFO and the periodic transmit request queue.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PTXQTOP[7:0]								PTXQSAV[7:0]

	PTXFSAVL[15:0]															
	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

- Bits 31:24 PTXQTOP[7:0]:** Top of the periodic transmit request queue

  - This indicates the entry in the periodic Tx request queue that is currently being processed by the MAC.
  - This register is used for debugging.
  - Bit 31: Odd/Even frame
  - 0: send in even frame
  - 1: send in odd frame
  - Bits 30:27: Channel/endpoint number
  - Bits 26:25: Type
  - 00: IN/OUT
  - 01: Zero-length packet
  - 11: Disable channel command
  - Bit 24: Terminate (last entry for the selected channel/endpoint)
  
- Bits 23:16 PTXQSAV[7:0]:** Periodic transmit request queue space available

  - Indicates the number of free locations available to be written in the periodic transmit request queue. This queue holds both IN and OUT requests.
  - 00: Periodic transmit request queue is full
  - 01: 1 location available
  - 10: 2 locations available
  - bxn: n locations available (0 ≤ n ≤ 8)
  - Others: Reserved
  
- Bits 15:0 PTXFSAVL[15:0]:** Periodic transmit data FIFO space available

  - Indicates the number of free locations available to be written to in the periodic Tx FIFO.
  - Values are in terms of 32-bit words
  - 0000: Periodic Tx FIFO is full
  - 0001: 1 word available
  - 0010: 2 words available
  - bxn: n words available (where 0 ≤ n ≤ PTXFD)
  - Others: Reserved

### 62.14.25 OTG host all channels interrupt register (OTG\_HAINT)

Address offset: 0x414

Reset value: 0x0000 0000

When a significant event occurs on a channel, the host all channels interrupt register interrupts the application using the host channels interrupt bit of the core interrupt register (HCINT bit in OTG\_GINTSTS). This is shown in *Figure 727*. There is one interrupt bit per channel, up to a maximum of 16 bits. Bits in this register are set and cleared when the application sets and clears bits in the corresponding host channel-x interrupt register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

HAINT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **HAINT[15:0]**: Channel interrupts

One bit per channel: Bit 0 for Channel 0, bit 15 for Channel 15

### 62.14.26 OTG host all channels interrupt mask register (OTG\_HAINTMSK)

Address offset: 0x418

Reset value: 0x0000 0000

The host all channel interrupt mask register works with the host all channel interrupt register to interrupt the application when an event occurs on a channel. There is one interrupt mask bit per channel, up to a maximum of 16 bits.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

HAINTM[15:0]															
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **HAINTM[15:0]**: Channel interrupt mask

0: Masked interrupt

1: Unmasked interrupt

One bit per channel: Bit 0 for channel 0, bit 15 for channel 15

### 62.14.27 OTG host frame list base address register (OTG\_HFLBADDR)

Address offset: 0x41C

Reset value: 0x0000 0000

This register holds the starting address of the frame list information (scatter/gather mode).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HFLBADDR[31:16]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

HFLBADDR[15:0]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

Bits 31:0 **HFLBADDR[31:0]**: The starting address of the frame list (scatter/gather mode).  
 This register is used only for isochronous and interrupt channels.

### 62.14.28 OTG host port control and status register (OTG\_HPRT)

Address offset: 0x440

Reset value: 0x0000 0000

This register is available only in host mode. Currently, the OTG host supports only one port.

A single register holds USB port-related information such as USB reset, enable, suspend, resume, connect status, and test mode for each port. It is shown in [Figure 727](#). The rc\_w1 bits in this register can trigger an interrupt to the application through the host port interrupt bit of the core interrupt register (HPRTINT bit in OTG\_GINTSTS). On a port interrupt, the application must read this register and clear the bit that caused the interrupt. For the rc\_w1 bits, the application must write a 1 to the bit to clear the interrupt.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PSPD[1:0]		PTCTL [3]
													r	r	rW
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

rW	rW	rW	rW	r	r		rW	rs	rW	rc_w1	r	rc_w1	rc_w1	rc_w1	r

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:17 **PSPD[1:0]**: Port speed

Indicates the speed of the device attached to this port.

01: Full speed

10: Low speed

11: Reserved

00: High speed

Bits 16:13 **PTCTL[3:0]**: Port test control

The application writes a nonzero value to this field to put the port into a Test mode, and the corresponding pattern is signaled on the port.

0000: Test mode disabled

0001: Test\_J mode

0010: Test\_K mode

0011: Test\_SE0\_NAK mode

0100: Test\_Packet mode

0101: Test\_Force\_Enable

Others: Reserved

Bit 12 **PPWR**: Port power

The application uses this field to control power to this port, and the core clears this bit on an overcurrent condition.

0: Power off

1: Power on

Bits 11:10 **PLSTS[1:0]**: Port line status

Indicates the current logic level USB data lines

Bit 10: Logic level of OTG\_DP

Bit 11: Logic level of OTG\_DM

Bit 9 Reserved, must be kept at reset value.

Bit 8 **PRST**: Port reset

When the application sets this bit, a reset sequence is started on this port. The application must time the reset period and clear this bit after the reset sequence is complete.

0: Port not in reset

1: Port in reset

The application must leave this bit set for a minimum duration of at least 10 ms to start a reset on the port. The application can leave it set for another 10 ms in addition to the required minimum duration, before clearing the bit, even though there is no maximum limit set by the USB standard.

High speed: 50 ms

Full speed/Low speed: 10 ms

Bit 7 **PSUSP**: Port suspend

The application sets this bit to put this port in suspend mode. The core only stops sending SOFs when this is set. To stop the PHY clock, the application must set the port clock stop bit, which asserts the suspend input pin of the PHY.

The read value of this bit reflects the current suspend status of the port. This bit is cleared by the core after a remote wakeup signal is detected or the application sets the port reset bit or port resume bit in this register or the resume/remote wakeup detected interrupt bit or disconnect detected interrupt bit in the core interrupt register (WKUPINT or DISCINT in OTG\_GINTSTS, respectively).

0: Port not in suspend mode

1: Port in suspend mode

**Bit 6 PRES:** Port resume

The application sets this bit to drive resume signaling on the port. The core continues to drive the resume signal until the application clears this bit.

If the core detects a USB remote wakeup sequence, as indicated by the port resume/remote wakeup detected interrupt bit of the core interrupt register (WKUPINT bit in OTG\_GINTSTS), the core starts driving resume signaling without application intervention and clears this bit when it detects a disconnect condition. The read value of this bit indicates whether the core is currently driving resume signaling.

0: No resume driven

1: Resume driven

When LPM is enabled and the core is in L1 state, the behavior of this bit is as follow:

1. The application sets this bit to drive resume signaling on the port.

2. The core continues to drive the resume signal until a predetermined time specified in BESLTHRS[3:0] field of OTG\_GLPMCFG register.

3. If the core detects a USB remote wakeup sequence, as indicated by the port L1Resume/Remote L1Wakeup detected interrupt bit of the core interrupt register (WKUPINT in OTG\_GINTSTS), the core starts driving resume signaling without application intervention and clears this bit at the end of resume. This bit can be set or cleared by both the core and the application. This bit is cleared by the core even if there is no device connected to the host.

**Bit 5 POCCHNG:** Port overcurrent change

The core sets this bit when the status of the port overcurrent active bit (bit 4) in this register changes.

**Bit 4 POCA:** Port overcurrent active

Indicates the overcurrent condition of the port.

0: No overcurrent condition

1: Overcurrent condition

**Bit 3 PENCHNG:** Port enable/disable change

The core sets this bit when the status of the port enable bit 2 in this register changes.

**Bit 2 PENA:** Port enable

A port is enabled only by the core after a reset sequence, and is disabled by an overcurrent condition, a disconnect condition, or by the application clearing this bit. The application cannot set this bit by a register write. It can only clear it to disable the port. This bit does not trigger any interrupt to the application.

0: Port disabled

1: Port enabled

**Bit 1 PCDET:** Port connect detected

The core sets this bit when a device connection is detected to trigger an interrupt to the application using the host port interrupt bit in the core interrupt register (HPRTINT bit in OTG\_GINTSTS). The application must write a 1 to this bit to clear the interrupt.

**Bit 0 PCSTS:** Port connect status

0: No device is attached to the port

1: A device is attached to the port

**62.14.29 OTG host channel x characteristics register (OTG\_HCCHARx)**

Address offset: 0x500 + 0x20 \* x, (x = 0 to 15)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CHENA	CHDIS	ODD FRM	DAD[6:0]						MCNT[1:0]		EPTYP[1:0]		LSDEV	Res.	
rs	rs	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EPDIR	EPNUM[3:0]			MPSIZ[10:0]											
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

- Bit 31 CHENA:** Channel enable  
 When Scatter/Gather mode is enabled:  
 1'b0: Indicates that the descriptor structure is not yet ready  
 1'b1: Indicates that the descriptor structure and data buffer with data is setup and this channel can access the descriptor  
 When Scatter/Gather mode is disabled: This field is set by the application and cleared by the OTG host.  
 0: Channel disabled  
 1: Channel enabled
- Bit 30 CHDIS:** Channel disable  
 The application sets this bit to stop transmitting/receiving data on a channel, even before the transfer for that channel is complete. The application must wait for the Channel disabled interrupt before treating the channel as disabled.
- Bit 29 ODDFRM:** Odd frame  
 This field is set (reset) by the application to indicate that the OTG host must perform a transfer in an odd frame. This field is applicable for only periodic (isochronous and interrupt) transactions.  
 0: Even frame  
 1: Odd frame
- Bits 28:22 DAD[6:0]:** Device address  
 This field selects the specific device serving as the data source or sink.
- Bits 21:20 MCNT[1:0]:** Multicount  
 This field indicates to the host the number of transactions that must be executed per frame for this periodic endpoint. For non-periodic transfers, this field is not used  
 00: Reserved. This field yields undefined results  
 01: 1 transaction  
 10: 2 transactions per frame to be issued for this endpoint  
 11: 3 transactions per frame to be issued for this endpoint  
*Note: This field must be set to at least 01.*
- Bits 19:18 EPTYP[1:0]:** Endpoint type  
 Indicates the transfer type selected.  
 00: Control  
 01: Isochronous  
 10: Bulk  
 11: Interrupt

- Bit 17 **LSDEV**: Low-speed device  
This field is set by the application to indicate that this channel is communicating to a low-speed device.
- Bit 16 Reserved, must be kept at reset value.
- Bit 15 **EPDIR**: Endpoint direction  
Indicates whether the transaction is IN or OUT.  
0: OUT  
1: IN
- Bits 14:11 **EPNUM[3:0]**: Endpoint number  
Indicates the endpoint number on the device serving as the data source or sink.
- Bits 10:0 **MPSIZ[10:0]**: Maximum packet size  
Indicates the maximum packet size of the associated endpoint.

### 62.14.30 OTG host channel x split control register (OTG\_HCSPLTx)

Address offset: 0x504 + 0x20 \* x, (x = 0 to 15)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

- Bit 31 **SPLITEN**: Split enable  
The application sets this bit to indicate that this channel is enabled to perform split transactions.
- Bits 30:17 Reserved, must be kept at reset value.
- Bit 16 **COMPLSPLT**: Do complete split  
The application sets this bit to request the OTG host to perform a complete split transaction.
- Bits 15:14 **XACTPOS[1:0]**: Transaction position  
This field is used to determine whether to send all, first, middle, or last payloads with each OUT transaction.  
11: All. This is the entire data payload of this transaction (which is less than or equal to 188 bytes)  
10: Begin. This is the first data payload of this transaction (which is larger than 188 bytes)  
00: Mid. This is the middle payload of this transaction (which is larger than 188 bytes)  
01: End. This is the last payload of this transaction (which is larger than 188 bytes)
- Bits 13:7 **HUBADDR[6:0]**: Hub address  
This field holds the device address of the transaction translator's hub.
- Bits 6:0 **PRTADDR[6:0]**: Port address  
This field is the port number of the recipient transaction translator.

### 62.14.31 OTG host channel x interrupt register (OTG\_HCINTx)

Address offset: 0x508 + 0x20 \* x, (x = 0 to 15)

Reset value: 0x0000 0000

This register indicates the status of a channel with respect to USB- and AHB-related events. It is shown in [Figure 727](#). The application must read this register when the host channels interrupt bit in the core interrupt register (HCINT bit in OTG\_GINTSTS) is set. Before the application can read this register, it must first read the host all channels interrupt (OTG\_HAINT) register to get the exact channel number for the host channel-x interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the OTG\_HAINT and OTG\_GINTSTS registers.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	DE SCLST ROLL	XC SXACT ERR	BNA	DTERR	FRM OR	BBERR	TXERR	NYET	ACK	NAK	STALL	AHB ERR	CHH	XFRC
		rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **DESCLSTROLL**: Descriptor rollover interrupt.

This bit is valid only when Scatter/Gather DMA mode is enabled. The core sets this bit when the corresponding channel descriptor list rolls over. For non Scatter/Gather DMA mode, this bit is reserved.

Bit 12 **XCSXACTERR**: Excessive transaction error.

This bit is valid only when Scatter/Gather DMA mode is enabled. The core sets this bit when 3 consecutive transaction errors occurred on the USB bus. XCS\_XACT\_ERR is not generated for isochronous channels. For non Scatter/Gather DMA mode, this bit is reserved.

Bit 11 **BNA**: Buffer not available interrupt.

This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the core to process. BNA interrupt is not generated for isochronous channels. For non Scatter/Gather DMA mode, this bit is reserved.

Bit 10 **DTERR**: Data toggle error. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

Bit 9 **FRMOR**: Frame overrun. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

Bit 8 **BBERR**: Babble error. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

Bit 7 **TXERR**: Transaction error. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

Indicates one of the following errors occurred on the USB.

- CRC check failure
- Timeout
- Bit stuff error
- False EOP

- Bit 6 **NYET**: Not yet ready response received interrupt. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.
- Bit 5 **ACK**: ACK response received/transmitted interrupt. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.
- Bit 4 **NAK**: NAK response received interrupt. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.
- Bit 3 **STALL**: STALL response received interrupt. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.
- Bit 2 **AHBERR**: AHB error  
 This error is generated only in Internal DMA mode when an AHB error occurs during an AHB read/write operation. The application can read the corresponding DMA channel address register to get the error address.
- Bit 1 **CHH**: Channel halted.  
 In non scatter/gather DMA mode indicates the transfer completed abnormally either because of any USB transaction error or in response to disable request by the application. In scatter/gather DMA mode, this indicates that transfer completed due to any of the following:
  - EOL being set in descriptor
  - AHB error
  - Excessive transaction errors
  - In response to disable request by the application
  - Babble
  - Stall
- Bit 0 **XFRC**: Transfer completed.  
 Transfer completed normally without any errors.

### 62.14.32 OTG host channel x interrupt mask register (OTG\_HCINTMSKx)

Address offset: 0x50C + 0x20 \* x, (x = 0 to 15)

Reset value: 0x0000 0000

This register reflects the mask for each channel status described in the previous section.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

		rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **DESCLSTROLLMSK**: Descriptor rollover interrupt mask register.

This bit is valid only when Scatter/Gather DMA mode is enabled.

In non Scatter/Gather DMA mode, this bit is reserved.

Bit 12 Reserved, must be kept at reset value.

Bit 11 **BNAMSK**: Buffer not available interrupt mask register.

This bit is valid only when Scatter/Gather DMA mode is enabled.

In non Scatter/Gather DMA mode, this bit is reserved

Bit 10 **DTERRM**: Data toggle error mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

0: Masked interrupt

1: Unmasked interrupt

Bit 9 **FRMORM**: Frame overrun mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

0: Masked interrupt

1: Unmasked interrupt

Bit 8 **BBERRM**: Babble error mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

0: Masked interrupt

1: Unmasked interrupt

Bit 7 **TXERRM**: Transaction error mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

0: Masked interrupt

1: Unmasked interrupt

Bit 6 **NYET**: response received interrupt mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

0: Masked interrupt

1: Unmasked interrupt

Bit 5 **ACKM**: ACK response received/transmitted interrupt mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

0: Masked interrupt

1: Unmasked interrupt

Bit 4 **NAKM**: NAK response received interrupt mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

0: Masked interrupt

1: Unmasked interrupt

Bit 3 **STALLM**: STALL response received interrupt mask. In Scatter/Gather DMA mode, the interrupt due to this bit is masked.

0: Masked interrupt

1: Unmasked interrupt

Bit 2 **AHBERRM**: AHB error. In scatter/gather DMA mode for host, interrupts will not be generated due to the corresponding bits set in OTG\_HCINTx.

- 0: Masked interrupt
- 1: Unmasked interrupt

Bit 1 **CHHM**: Channel halted mask

- 0: Masked interrupt
- 1: Unmasked interrupt

Bit 0 **XFRM**: Transfer completed mask

- 0: Masked interrupt
- 1: Unmasked interrupt

### 62.14.33 OTG host channel x transfer size register (OTG\_HCTSIZx)

Address offset: 0x510 + 0x20 \* x, (x = 0 to 15)

Reset value: 0x0000 0000

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DO PNG		DPID[1:0]		PKTCNT[9:0]								XFRSIZ[18:16]			
	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	XFRSIZ[15:0]															
	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

Bit 31 **DOPNG**: Do Ping

This bit is used only for OUT transfers. Setting this field to 1 directs the host to do PING protocol.

*Note: Do not set this bit for IN transfers. If this bit is set for IN transfers, it disables the channel.*

Bits 30:29 **DPID[1:0]**: Data PID

The application programs this field with the type of PID to use for the initial transaction. The host maintains this field for the rest of the transfer.

- 00: DATA0
- 01: DATA2
- 10: DATA1
- 11: SETUP (control) / MDATA (non-control)

Bits 28:19 **PKTCNT[9:0]**: Packet count

This field is programmed by the application with the expected number of packets to be transmitted (OUT) or received (IN).

The host decrements this count on every successful transmission or reception of an OUT/IN packet. Once this count reaches zero, the application is interrupted to indicate normal completion.

Bits 18:0 **XFRSIZ[18:0]**: Transfer size

For an OUT, this field is the number of data bytes the host sends during the transfer.

For an IN, this field is the buffer size that the application has reserved for the transfer. The application is expected to program this field as an integer multiple of the maximum packet size for IN transactions (periodic and non-periodic).

**62.14.34 OTG host channel x transfer size register (OTG\_HCTSIZSGx)**

Address offset: 0x510 + 0x20 \* x, (x = 0 to 15)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

Bit 31 **DOPNG**: Do Ping

This bit is used only for OUT transfers. Setting this field to 1 directs the host to do PING protocol.

*Note: Do not set this bit for IN transfers. If this bit is set for IN transfers, it disables the channel.*

Bits 30:29 **PID[1:0]**: Pid

The application programs this field with the type of PID to use for the initial transaction. The host maintains this field for the rest of the transfer.

00: DATA0

01: DATA2

10: DATA1

11: MDATA (non-control) / SETUP (control)

Bits 28:16 Reserved, must be kept at reset value.

Bits 15:8 **NTD[7:0]**: Number of transfer descriptors

Non isochronous: this value is in terms of number of descriptors. The maximum number of descriptor that can be present in the list is 64. The values can be from 0 to 63.

0: 1 descriptor

1: 2 descriptors

...

63: 64 descriptors

Others: Reserved

This field indicates the total number of descriptors present in that list. The core will wrap around after servicing NTD number of descriptors for that list.

Isochronous: this field indicates the number of descriptors present in that list.

The possible values for FS are:

1: 2 descriptors

3: 4 descriptors

7: 8 descriptors

15: 16 descriptors

31: 32 descriptors

63: 64 descriptors

Others: Reserved

The possible values for HS are:

7: 8 descriptors

15: 16 descriptors

31: 32 descriptors

63: 64 descriptors

127: 128 descriptors

255: 256 descriptors

Others: Reserved

Bits 7:0 **SCHED\_INFO[7:0]**: Schedule information

Every bit in this 8 bit register indicates scheduling for that microframe. Bit 0 indicates scheduling for 1st microframe and bit 7 indicates scheduling for 8th microframe in that frame. A value of 0b11111111 indicates that the corresponding interrupt channel is scheduled to issue a token every microframe in that frame. A value of 0b10101010 indicates that the corresponding interrupt channel is scheduled to issue a token every alternate microframe starting with second microframe. Note that this field is applicable only for periodic (isochronous and interrupt) channels.

**62.14.35 OTG host channel x DMA address register in buffer DMA [alternate] (OTG\_HCDMAx)**

Address offset:  $0x514 + 0x20 * x$ , ( $x = 0$  to  $15$ )

Reset value:  $0x0000\ 0000$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

DMAADDR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DMAADDR[31:0]**: DMA address

This field holds the start address in the external memory from which the data for the endpoint must be fetched or to which it must be stored. This register is incremented on every AHB transaction.

**62.14.36 OTG host channel x DMA address register in scatter/gather DMA [alternate] (OTG\_HCDMASGx)**

Address offset:  $0x514 + 0x20 * x$ , ( $x = 0$  to  $15$ )

Reset value:  $0x0000\ 0000$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DMASG[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DMASG[15:3]													Res.	Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw			

Bits 31:3 **DMASG[31:3]:** DMA scatter/gather information

The DMASG information is composed of two parts  $DMASG\_ADDR = DMASG[31:N]$  and  $DMASG\_CTD = DAMSG[N-1:3]$ .

Non-isochronous case (N = 9):

The DAMSG\_ADDR field holds the start address of the 512 bytes page. The first descriptor in the list should be located in this address. The first descriptor may be or may not be ready. The core starts processing the list from the CTD value.

The DMASG\_CTD field holds a value in terms of number of descriptors. The values can be from 0 (1 descriptor) to 63 (64 descriptors). This field indicates the current descriptor processed in the list. This field is updated both by application and the core. For example, if the application enables the channel after programming  $CTD = 5$ , then the core will start processing the 6th descriptor. The address is obtained by adding a value of  $8 * 5 = 40$  bytes (decimal) to DMAAddr.

Isochronous case (N=4 to 11):

The DAMSG\_ADDR field holds the address of the  $2*(NTD+1)$  bytes of locations in which the isochronous descriptors are present where N is based on NTD as per the following table:

HS ISOC; NTD = 7:	N = 6
HS ISOC; NTD = 15:	N = 7
HS ISOC; NTD = 31:	N = 8
HS ISOC; NTD = 63:	N = 9
HS ISOC; NTD = 127:	N = 10
HS ISOC; NTD = 255:	N = 11
FS ISOC; NTD = 1:	N = 4
FS ISOC; NTD = 3:	N = 5
FS ISOC; NTD = 7:	N = 6
FS ISOC; NTD = 15:	N = 7
FS ISOC; NTD = 31:	N = 8
FS ISOC; NTD = 63:	N = 9

The DMASG\_CTD field is based on the current frame/(micro)frame value. Need to be set to zero by application.

Bits 2:0 Reserved, must be kept at reset value.

**62.14.37 OTG host channel-n DMA address buffer register (OTG\_HCDMABx)**

Address offset:  $0x51C + 0x20 * x$ , (x = 0 to 15)

Reset value: 0x0000 0000 (0x0000 0000)

Bits 31:0 **HCDMAB[31:0]:** DMA address

This register holds the current buffer address (scatter/gather mode).

### 62.14.38 Device-mode registers

These registers must be programmed every time the core changes to device mode

### 62.14.39 OTG device configuration register (OTG\_DCFG)

Address offset: 0x800

Reset value: 0x0220 0000

This register configures the core in device mode after power-on or after certain control commands or enumeration. Do not make changes to this register after initial programming.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	PERSCHIVL[1:0]		DESCDMA	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:24 **PERSCHIVL[1:0]**: Periodic schedule interval

This field specifies the amount of time the Internal DMA engine must allocate for fetching periodic IN endpoint data. Based on the number of periodic endpoints, this value must be specified as 25, 50 or 75% of the (micro) frame.

- When any periodic endpoints are active, the internal DMA engine allocates the specified amount of time in fetching periodic IN endpoint data
- When no periodic endpoint is active, then the internal DMA engine services nonperiodic endpoints, ignoring this field
- After the specified time within a (micro) frame, the DMA switches to fetching nonperiodic endpoints

00: 25% of (micro)frame

01: 50% of (micro)frame

10: 75% of (micro)frame

11: Reserved

*Note: Periodic Scheduling Interval (PERSCHIVL) must be programmed for Scatter/Gather DMA mode.*

Bit 23 **DESCDMA**: Enable scatter/gather DMA in device mode

The application can set this bit during initialization to enable the Scatter/Gather DMA operation. This bit must be modified only once after a reset. The following combinations are available for programming:

OTG\_GAHBCFG.DMAEN=0,OTG\_DCFG.DESCDMA=0 => Slave mode

OTG\_GAHBCFG.DMAEN=0,OTG\_DCFG.DESCDMA=1 => Invalid

OTG\_GAHBCFG.DMAEN=1,OTG\_DCFG.DESCDMA=0 => Buffer DMA mode

OTG\_GAHBCFG.DMAEN=1,OTG\_DCFG.DESCDMA=1 => Scatter/Gather DMA mode

Bits 22:16 Reserved, must be kept at reset value.

- Bit 15 **ERRATIM**: Erratic error interrupt mask  
1: Mask early suspend interrupt on erratic error  
0: Early suspend interrupt is generated on erratic error
- Bit 14 **XCVRDLY**: Transceiver delay  
Enables or disables delay in ULPI timing during device chirp.  
0: Disable delay (use default timing)  
1: Enable delay to default timing, necessary for some ULPI PHYs
- Bit 13 Reserved, must be kept at reset value.
- Bits 12:11 **PFIVL[1:0]**: Periodic frame interval  
Indicates the time within a frame at which the application must be notified using the end of periodic frame interrupt. This can be used to determine if all the isochronous traffic for that frame is complete.  
00: 80% of the frame interval  
01: 85% of the frame interval  
10: 90% of the frame interval  
11: 95% of the frame interval
- Bits 10:4 **DAD[6:0]**: Device address  
The application must program this field after every SetAddress control command.
- Bit 3 Reserved, must be kept at reset value.
- Bit 2 **NZLSOHSK**: Non-zero-length status OUT handshake  
The application can use this field to select the handshake the core sends on receiving a nonzero-length data packet during the OUT transaction of a control transfer's status stage.  
1: Send a STALL handshake on a nonzero-length status OUT transaction and do not send the received OUT packet to the application.  
0: Send the received OUT packet to the application (zero-length or nonzero-length) and send a handshake based on the NAK and STALL bits for the endpoint in the device endpoint control register.
- Bits 1:0 **DSPD[1:0]**: Device speed  
Indicates the speed at which the application requires the core to enumerate, or the maximum speed the application can support. However, the actual bus speed is determined only after the chirp sequence is completed, and is based on the speed of the USB host to which the core is connected.  
00: High speed  
01: Full speed using HS  
10: Reserved  
11: Full speed using internal FS PHY

### 62.14.40 OTG device control register (OTG\_DCTL)

Address offset: 0x804

Reset value: 0x0000 0002

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DS BESL RJCT	ENCO NTONB NA	Res.
													rw	rw	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	PO PRG DNE	CGO NAK	SGO NAK	CGI NAK	SGI NAK	TCTL[2:0]			GON STS	GIN STS	SDIS	RWU SIG
				rw	w	w	w	w	rw	rw	rw	r	r	rw	rw

Bits 31:19 Reserved, must be kept at reset value.

**Bit 18 DSBSLRJCT:** Deep sleep BESL reject

Core rejects LPM request with BESL value greater than BESL threshold programmed. NYET response is sent for LPM tokens with BESL value greater than BESL threshold. By default, the deep sleep BESL reject feature is disabled.

**Bit 17 ENCONTONBNA:** Enable continue on BNA

This bit enables the core to continue on BNA for Bulk OUT and INTR OUT endpoints. With this feature enabled, when a Bulk OUT or INTR OUT endpoint receives a BNA interrupt the core starts processing the descriptor that caused the BNA interrupt after the endpoint re-enables the endpoint.

0: After receiving BNA interrupt, the core disables the endpoint. When the endpoint is re-enabled by the application, the core starts processing from the DOEPDMA descriptor.

1: After receiving BNA interrupt, the core disables the endpoint. When the endpoint is re-enabled by the application, the core starts processing from the descriptor that received the BNA interrupt. It is a one-time programmable after reset bit like any other OTG\_DCTL register bit.

Bits 16:12 Reserved, must be kept at reset value.

**Bit 11 POPRGDNE:** Power-on programming done

The application uses this bit to indicate that register programming is completed after a wakeup from power down mode.

**Bit 10 CGONAK:** Clear global OUT NAK

Writing 1 to this field clears the Global OUT NAK.

**Bit 9 SGONAK:** Set global OUT NAK

Writing 1 to this field sets the Global OUT NAK.

The application uses this bit to send a NAK handshake on all OUT endpoints.

The application must set this bit only after making sure that the Global OUT NAK effective bit in the core interrupt register (GONAKEFF bit in OTG\_GINTSTS) is cleared.

**Bit 8 CGINAK:** Clear global IN NAK

Writing 1 to this field clears the Global IN NAK.

**Bit 7 SGINAK:** Set global IN NAK

Writing 1 to this field sets the Global non-periodic IN NAK. The application uses this bit to send a NAK handshake on all non-periodic IN endpoints.

The application must set this bit only after making sure that the Global IN NAK effective bit in the core interrupt register (GINAKEFF bit in OTG\_GINTSTS) is cleared.

Bits 6:4 **TCTL[2:0]**: Test control

- 000: Test mode disabled
- 001: Test\_J mode
- 010: Test\_K mode
- 011: Test\_SE0\_NAK mode
- 100: Test\_Packet mode
- 101: Test\_Force\_Enable
- Others: Reserved

Bit 3 **GONSTS**: Global OUT NAK status

- 0:A handshake is sent based on the FIFO status and the NAK and STALL bit settings.
- 1:No data is written to the Rx FIFO, irrespective of space availability. Sends a NAK handshake on all packets, except on SETUP transactions. All isochronous OUT packets are dropped.

Bit 2 **GINSTS**: Global IN NAK status

- 0:A handshake is sent out based on the data availability in the transmit FIFO.
- 1:A NAK handshake is sent out on all non-periodic IN endpoints, irrespective of the data availability in the transmit FIFO.

Bit 1 **SDIS**: Soft disconnect

- The application uses this bit to signal the USB OTG core to perform a soft disconnect. As long as this bit is set, the host does not see that the device is connected, and the device does not receive signals on the USB. The core stays in the disconnected state until the application clears this bit.
- 0:Normal operation. When this bit is cleared after a soft disconnect, the core generates a device connect event to the USB host. When the device is reconnected, the USB host restarts device enumeration.
- 1:The core generates a device disconnect event to the USB host.

Bit 0 **RWUSIG**: Remote wakeup signaling

- When the application sets this bit, the core initiates remote signaling to wake up the USB host. The application must set this bit to instruct the core to exit the suspend state. As specified in the USB 2.0 specification, the application must clear this bit 1 ms to 15 ms after setting it.
- If LPM is enabled and the core is in the L1 (sleep) state, when the application sets this bit, the core initiates L1 remote signaling to wake up the USB host. The application must set this bit to instruct the core to exit the sleep state. As specified in the LPM specification, the hardware automatically clears this bit 50  $\mu$ s ( $T_{L1DevDrvResume}$ ) after being set by the application. The application must not set this bit when bRemoteWake from the previous LPM transaction is zero (refer to REMWAKE bit in GLPMCFG register).

[Table 509](#) contains the minimum duration (according to device state) for which the Soft disconnect (SDIS) bit must be set for the USB host to detect a device disconnect. To accommodate clock jitter, it is recommended that the application add some extra delay to the specified minimum duration.

**Table 509. Minimum duration for soft disconnect**

Operating speed	Device state	Minimum duration
Full speed	Suspended	1 ms + 2.5 $\mu$ s
Full speed	Idle	2.5 $\mu$ s
Full speed	Not Idle or suspended (Performing transactions)	2.5 $\mu$ s
High speed	Not Idle or suspended (Performing transactions)	125 $\mu$ s

### 62.14.41 OTG device status register (OTG\_DSTS)

Address offset: 0x808

Reset value: 0x0000 0010

This register indicates the status of the core with respect to USB-related events. It must be read on interrupts from the device all interrupts (OTG\_DAINTE) register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DEVLNSTS[1:0]		FNSOF[13:8]					
								r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FNSOF[7:0]								Res.	Res.	Res.	Res.	EERR	ENUMSPD[1:0]		SUSP STS
r	r	r	r	r	r	r	r					r	r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:22 **DEVLNSTS[1:0]**: Device line status  
 Indicates the current logic level USB data lines.  
 Bit [23]: Logic level of D+  
 Bit [22]: Logic level of D-

Bits 21:8 **FNSOF[13:0]**: Frame number of the received SOF

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **EERR**: Erratic error  
 The core sets this bit to report any erratic errors.  
 Due to erratic errors, the OTG\_HS controller goes into suspended state and an interrupt is generated to the application with Early suspend bit of the OTG\_GINTSTS register (ESUSP bit in OTG\_GINTSTS). If the early suspend is asserted due to an erratic error, the application can only perform a soft disconnect recover.

Bits 2:1 **ENUMSPD[1:0]**: Enumerated speed  
 Indicates the speed at which the OTG\_HS controller has come up after speed detection through a chirp sequence.  
 00: High Speed using HS PHY  
 01: Full Speed using HS PHY  
 11: Full speed using embedded FS PHY  
 Others: reserved

Bit 0 **SUSPSTS**: Suspend status  
 In device mode, this bit is set as long as a suspend condition is detected on the USB. The core enters the suspended state when there is no activity on the USB data lines for a period of 3 ms. The core comes out of the suspend:  
 – When there is an activity on the USB data lines  
 – When the application writes to the remote wakeup signaling bit in the OTG\_DCTL register (RWUSIG bit in OTG\_DCTL).

### 62.14.42 OTG device IN endpoint common interrupt mask register (OTG\_DIEPMSK)

Address offset: 0x810

Reset value: 0x0000 0000

This register works with each of the OTG\_DIEPINTx registers for all endpoints to generate an interrupt per IN endpoint. The IN endpoint interrupt for a specific status in the OTG\_DIEPINTx register can be masked by writing to the corresponding bit in this register. Status bits are masked by default.

  - 0: Masked interrupt
  - 1: Unmasked interrupt
- Bit 0 **XFRCM**: Transfer completed interrupt mask
  - 0: Masked interrupt
  - 1: Unmasked interrupt

**62.14.43 OTG device OUT endpoint common interrupt mask register (OTG\_DOEPMSK)**

Address offset: 0x814

Reset value: 0x0000 0000

This register works with each of the OTG\_DOEPINTx registers for all endpoints to generate an interrupt per OUT endpoint. The OUT endpoint interrupt for a specific status in the OTG\_DOEPINTx register can be masked by writing into the corresponding bit in this register. Status bits are masked by default.

 1: Unmasked interrupt

#### 62.14.44 OTG device all endpoints interrupt register (OTG\_DAIN)

Address offset: 0x818

Reset value: 0x0000 0000

When a significant event occurs on an endpoint, a OTG\_DAIN register interrupts the application using the device OUT endpoints interrupt bit or device IN endpoints interrupt bit of the OTG\_GINTSTS register (OEPINT or IEPINT in OTG\_GINTSTS, respectively). There is one interrupt bit per endpoint, up to a maximum of 16 bits for OUT endpoints and 16 bits for IN endpoints. For a bidirectional endpoint, the corresponding IN and OUT interrupt bits are used. Bits in this register are set and cleared when the application sets and clears bits in the corresponding device endpoint-x interrupt register (OTG\_DIEPINTx/OTG\_DOEPINTx).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OEPINT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

IEPINT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 **OEPINT[15:0]**: OUT endpoint interrupt bits  
 One bit per OUT endpoint:  
 Bit 16 for OUT endpoint 0, bit 19 for OUT endpoint 3.

Bits 15:0 **IEPINT[15:0]**: IN endpoint interrupt bits  
 One bit per IN endpoint:  
 Bit 0 for IN endpoint 0, bit 3 for endpoint 3.

**62.14.45 OTG all endpoints interrupt mask register (OTG\_DAINMSK)**

Address offset: 0x81C

Reset value: 0x0000 0000

The OTG\_DAINMSK register works with the device endpoint interrupt register to interrupt the application when an event occurs on a device endpoint. However, the OTG\_DAIN register bit corresponding to that interrupt is still set.

 Bit 0 for IN EP 0, bit 3 for IN EP 3  
 0: Masked interrupt  
 1: Unmasked interrupt

**62.14.46 OTG device V<sub>BUS</sub> discharge time register (OTG\_DVBUSDIS)**

Address offset: 0x0828

Reset value: 0x0000 17D7

This register specifies the V<sub>BUS</sub> discharge time after V<sub>BUS</sub> pulsing during SRP.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **VBUSDT[15:0]**: Device V<sub>BUS</sub> discharge time

Specifies the V<sub>BUS</sub> discharge time after V<sub>BUS</sub> pulsing during SRP. This value equals:  
 V<sub>BUS</sub> discharge time in PHY clocks / 1 024  
 Depending on V<sub>BUS</sub> load, this value may need adjusting.

**62.14.47 OTG device V<sub>BUS</sub> pulsing time register (OTG\_DVBUSPULSE)**

Address offset: 0x082C

Reset value: 0x0000 05B8

This register specifies the V<sub>BUS</sub> pulsing time during SRP.

					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **ARPEN**: Arbiter parking enable

This bit controls internal DMA arbiter parking for IN endpoints. When thresholding is enabled and this bit is set to one, then the arbiter parks on the IN endpoint for which there is a token received on the USB. This is done to avoid getting into underrun conditions. By default parking is enabled.

Bit 26 Reserved, must be kept at reset value.

Bits 25:17 **RXTHRLEN[8:0]**: Receive threshold length

This field specifies the receive thresholding size in 32-bit words. This field also specifies the amount of data received on the USB before the core can start transmitting on the AHB. The threshold length has to be at least eight 32-bit words. The recommended value for RXTHRLEN is to be the same as the programmed AHB burst length (HBSTLEN bit in OTG\_GAHBCFG).

Bit 16 **RXTHREN**: Receive threshold enable

When this bit is set, the core enables thresholding in the receive direction.

Bits 15:11 Reserved, must be kept at reset value.

Bits 10:2 **TXTHRLEN[8:0]**: Transmit threshold length

This field specifies the transmit thresholding size in 32-bit words. This field specifies the amount of data in bytes to be in the corresponding endpoint transmit FIFO, before the core can start transmitting on the USB. The threshold length has to be at least eight 32-bit words. This field controls both isochronous and nonisochronous IN endpoint thresholds. The recommended value for TXTHRLEN is to be the same as the programmed AHB burst length (HBSTLEN bit in OTG\_GAHBCFG).

Bit 1 **ISOTHREN**: ISO IN endpoint threshold enable

When this bit is set, the core enables thresholding for isochronous IN endpoints.

Bit 0 **NONISOTHREN**: Nonisochronous IN endpoints threshold enable

When this bit is set, the core enables thresholding for nonisochronous IN endpoints.

### 62.14.49 OTG device IN endpoint FIFO empty interrupt mask register (OTG\_DIEPEMPMSK)

Address offset: 0x834

Reset value: 0x0000 0000

This register is used to control the IN endpoint FIFO empty interrupt generation (TXFE\_OTG\_DIEPINTx).

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **OEP1INT**: OUT endpoint 1 interrupt bit

Bits 16:2 Reserved, must be kept at reset value.

Bit 1 **IEP1INT**: IN endpoint 1 interrupt bit

Bit 0 Reserved, must be kept at reset value.

### 62.14.51 OTG device each endpoint interrupt mask register (OTG\_DEACHINTMSK)

Address offset: 0x083C

Reset value: 0x0000 0000

There is one interrupt bit for endpoint 1 IN and one interrupt bit for endpoint 1 OUT.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **OEP1INTM**: OUT endpoint 1 interrupt mask bit

Bits 16:2 Reserved, must be kept at reset value.

Bit 1 **IEP1INTM**: IN endpoint 1 interrupt mask bit

Bit 0 Reserved, must be kept at reset value.

### 62.14.52 OTG device each IN endpoint-1 interrupt mask register (OTG\_HS\_DIEPEACHMSK1)

Address offset: 0x844

Reset value: 0x0000 0000

This register works with the OTG\_DIEPINT1 register to generate a dedicated interrupt OTG\_HS\_EP1\_IN for endpoint #1. The IN endpoint interrupt for a specific status in the OTG\_DOEPINT1 register can be masked by writing into the corresponding bit in this register. Status bits are masked by default.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

- Bit 0 **XFRM**: Transfer completed interrupt mask  
 0: Masked interrupt  
 1: Unmasked interrupt

**62.14.53 OTG device each OUT endpoint-1 interrupt mask register (OTG\_HS\_DOEPEACHMSK1)**

Address offset: 0x884

Reset value: 0x0000 0000

This register works with the OTG\_DOEPINT1 register to generate a dedicated interrupt OTG\_HS\_EP1\_OUT for endpoint #1. The OUT endpoint interrupt for a specific status in the OTG\_DOEPINT1 register can be masked by writing into the corresponding bit in this register. Status bits are masked by default.

0: Masked interrupt  
1: Unmasked interrupt
- Bit 7 Reserved, must be kept at reset value.
- Bit 6 **B2BSTUPM**: Back-to-back SETUP packets received mask  
Applies to control OUT endpoints only.  
0: Masked interrupt  
1: Unmasked interrupt
- Bit 5 Reserved, must be kept at reset value.
- Bit 4 **OTEPDM**: OUT token received when endpoint disabled mask  
Applies to control OUT endpoints only.  
0: Masked interrupt  
1: Unmasked interrupt
- Bit 3 **STUPM**: STUPM: SETUP phase done mask  
Applies to control endpoints only.  
0: Masked interrupt  
1: Unmasked interrupt
- Bit 2 **AHBERRM**: AHB error mask  
0: Masked interrupt  
1: Unmasked interrupt
- Bit 1 **EPDM**: Endpoint disabled interrupt mask  
0: Masked interrupt  
1: Unmasked interrupt
- Bit 0 **XFRM**: Transfer completed interrupt mask  
0: Masked interrupt  
1: Unmasked interrupt

### 62.14.54 OTG device IN endpoint x control register (OTG\_DIEPCTLx)

Address offset: 0x900 + 0x20 \* x, (x = 0 to 8)

Reset value: 0x0000 0000

The application uses this register to control the behavior of each logical endpoint other than endpoint 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EPENA	EPDIS	SODDFRM	SD0PID/SEVNFRM	SNAK	CNAK	TXFNUM[3:0]				STALL	Res.	EPTYP[1:0]		NAKSTS	EONUM/DPID
rs	rs	w	w	w	w	rw	rw	rw	rw	rw		rw	rw	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
USBAEP	Res.	Res.	Res.	Res.	MPSIZ[10:0]										
rw					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

**Bit 31 EPENA:** Endpoint enable

The application sets this bit to start transmitting data on an endpoint.  
 The core clears this bit before setting any of the following interrupts on this endpoint:

- SETUP phase done
- Endpoint disabled
- Transfer completed

**Bit 30 EPDIS:** Endpoint disable

The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the endpoint disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the endpoint disabled interrupt. The application must set this bit only if endpoint enable is already set for this endpoint.

**Bit 29 SODDFRM:** Set odd frame

Applies to isochronous IN and OUT endpoints only.  
 Writing to this field sets the Even/Odd frame (EONUM) field to odd frame.

**Bit 28 SD0PID:** Set DATA0 PID

Applies to interrupt/bulk IN endpoints only.  
 Writing to this field sets the endpoint data PID (DPID) field in this register to DATA0.

**SEVNFRM:** Set even frame

Applies to isochronous IN endpoints only.  
 Writing to this field sets the Even/Odd frame (EONUM) field to even frame.

**Bit 27 SNAK:** Set NAK

A write to this bit sets the NAK bit for the endpoint.  
 Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for OUT endpoints on a transfer completed interrupt, or after a SETUP is received on the endpoint.

**Bit 26 CNAK:** Clear NAK

A write to this bit clears the NAK bit for the endpoint.

- Bits 25:22 **TXFNUM[3:0]**: Tx FIFO number  
These bits specify the FIFO number associated with this endpoint. Each active IN endpoint must be programmed to a separate FIFO number.  
This field is valid only for IN endpoints.
- Bit 21 **STALL**: STALL handshake  
Applies to non-control, non-isochronous IN endpoints only (access type is rw).  
The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority.  
Only the application can clear this bit, never the core.
- Bit 20 Reserved, must be kept at reset value.
- Bits 19:18 **EPTYP[1:0]**: Endpoint type  
This is the transfer type supported by this logical endpoint.  
00: Control  
01: Isochronous  
10: Bulk  
11: Interrupt
- Bit 17 **NAKSTS**: NAK status  
It indicates the following:  
0: The core is transmitting non-NAK handshakes based on the FIFO status.  
1: The core is transmitting NAK handshakes on this endpoint.  
When either the application or the core sets this bit:  
For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there are data available in the Tx FIFO.  
For isochronous IN endpoints: The core sends out a zero-length data packet, even if there are data available in the Tx FIFO.  
Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.
- Bit 16 **EONUM**: Even/odd frame  
Applies to isochronous IN endpoints only.  
Indicates the frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd frame number in which it intends to transmit/receive isochronous data for this endpoint using the SEVNFRM and SODDFRM fields in this register.  
0: Even frame  
1: Odd frame
- DPID**: Endpoint data PID  
Applies to interrupt/bulk IN endpoints only.  
Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The application uses the SD0PID register field to program either DATA0 or DATA1 PID.  
0: DATA0  
1: DATA1

Bit 15 **USBAEP**: USB active endpoint

Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit.

Bits 14:11 Reserved, must be kept at reset value.

Bits 10:0 **MPSIZ[10:0]**: Maximum packet size

The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.

### 62.14.55 OTG device IN endpoint x interrupt register (OTG\_DIEPINTx)

Address offset: 0x908 + 0x20 \* x, (x = 0 to 8)

Reset value: 0x0000 0080

This register indicates the status of an endpoint with respect to USB- and AHB-related events. It is shown in *Figure 727*. The application must read this register when the IN endpoints interrupt bit of the core interrupt register (IEPINT in OTG\_GINTSTS) is set. Before the application can read this register, it must first read the device all endpoints interrupt (OTG\_DAINTE) register to get the exact endpoint number for the device endpoint-x interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the OTG\_DAINTE and OTG\_GINTSTS registers.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	NAK	Res.	PKTD RPSTS	Res.	BNA	TXFIF OD RN	TXFE	IN EPNE	IN EPNM	ITTXFE	TOC	AHB ERR	EP DISD	XFRC
		rc_w1		rc_w1		rc_w1	rc_w1	r	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **NAK**: NAK input

The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to unavailability of data in the Tx FIFO.

Bit 12 Reserved, must be kept at reset value.

Bit 11 **PKTDRPSTS**: Packet dropped status

This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt.

Bit 10 Reserved, must be kept at reset value.

Bit 9 **BNA**: Buffer not available interrupt

The core generates this interrupt when the descriptor accessed is not ready for the core to process, such as host busy or DMA done. This bit is only valid when Scatter/Gather DMA mode is enabled.

- Bit 8 **TXFIFOUDRN**: Transmit Fifo Underrun (TxfifoUndrn)  
The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint. Dependency: This interrupt is valid only when Thresholding is enabled
- Bit 7 **TXFE**: Transmit FIFO empty  
This interrupt is asserted when the Tx FIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the Tx FIFO Empty Level bit in the OTG\_GAHBCFG register (TXFELVL bit in OTG\_GAHBCFG).
- Bit 6 **INEPNE**: IN endpoint NAK effective  
This bit can be cleared when the application clears the IN endpoint NAK by writing to the CNAK bit in OTG\_DIEPCTLx.  
This interrupt indicates that the core has sampled the NAK bit set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit set by the application has taken effect in the core.  
This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit.
- Bit 5 **INEPNM**: IN token received with EP mismatch  
Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received.
- Bit 4 **ITTXFE**: IN token received when Tx FIFO is empty  
Indicates that an IN token was received when the associated Tx FIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received.
- Bit 3 **TOC**: Timeout condition  
Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint.
- Bit 2 **AHBERR**: AHB error  
This is generated only in internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address.
- Bit 1 **EPDISD**: Endpoint disabled interrupt  
This bit indicates that the endpoint is disabled per the application's request.
- Bit 0 **XFRC**: Transfer completed interrupt  
This field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.

### 62.14.56 OTG device IN endpoint 0 transfer size register (OTG\_DIEPTSIZ0)

Address offset: 0x910

Reset value: 0x0000 0000

The application must modify this register before enabling endpoint 0. Once endpoint 0 is enabled using the endpoint enable bit in the device control endpoint 0 control registers (EPENA in OTG\_DIEPCTL0), the core modifies this register. The application can only read this register once the core has cleared the endpoint enable bit.

Nonzero endpoints use the registers for endpoints 1–3.

									r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:19 **PKTCNT[1:0]**: Packet count

Indicates the total number of USB packets that constitute the transfer size amount of data for endpoint 0.

This field is decremented every time a packet (maximum size or short packet) is read from the Tx FIFO.

Bits 18:7 Reserved, must be kept at reset value.

Bits 6:0 **XFRSIZ[6:0]**: Transfer size

Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be set to the maximum packet size of the endpoint, to be interrupted at the end of each packet.

The core decrements this field every time a packet from the external memory is written to the Tx FIFO.

### 62.14.57 OTG device IN endpoint x DMA address register (OTG\_DIEPDMAx)

Address offset: 0x914 + 0x20 \* x, (x = 0 to 8)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:0 **DMAADDR[31:0]**: DMA Address

This field holds the start address in the external memory from which the data for the endpoint must be fetched. This register is incremented on every AHB transaction.

**62.14.58 OTG device IN endpoint transmit FIFO status register (OTG\_DTXFSTSx)**

Address offset: 0x918 + 0x20 \* x, (x = 0 to 8)

Reset value: 0x0000 0200

This read-only register contains the free space information for the device IN endpoint Tx FIFO.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

INEPTFSAV[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **INEPTFSAV[15:0]**: IN endpoint Tx FIFO space available

Indicates the amount of free space available in the endpoint Tx FIFO.

Values are in terms of 32-bit words:

0x0: Endpoint Tx FIFO is full

0x1: 1 word available

0x2: 2 words available

0xn: n words available

Others: Reserved

**62.14.59 OTG device IN endpoint x transfer size register (OTG\_DIEPTSIZx)**

Address offset: 0x910 + 0x20 \* x, (x = 1 to 8)

Reset value: 0x0000 0000

The application must modify this register before enabling the endpoint. Once the endpoint is enabled using the endpoint enable bit in the OTG\_DIEPCTLx registers (EPENA bit in OTG\_DIEPCTLx), the core modifies this register. The application can only read this register once the core has cleared the endpoint enable bit.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	MCNT[1:0]		PKTCNT[9:0]										XFRSIZ[18:16]		
	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
XFRSIZ[15:0]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

Bit 31 Reserved, must be kept at reset value.

Bits 30:29 **MCNT[1:0]**: Multi count

For periodic IN endpoints, this field indicates the number of packets that must be transmitted per frame on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints.

- 01: 1 packet
- 10: 2 packets
- 11: 3 packets

Bits 28:19 **PKTCNT[9:0]**: Packet count

Indicates the total number of USB packets that constitute the transfer size amount of data for this endpoint.

This field is decremented every time a packet (maximum size or short packet) is read from the Tx FIFO.

Bits 18:0 **XFRSIZ[18:0]**: Transfer size

This field contains the transfer size in bytes for the current endpoint. The core only interrupts the application after it has exhausted the transfer size amount of data. The transfer size can be set to the maximum packet size of the endpoint, to be interrupted at the end of each packet.

The core decrements this field every time a packet from the external memory is written to the Tx FIFO.

### 62.14.60 OTG device control OUT endpoint 0 control register (OTG\_DOEPCTL0)

Address offset: 0xB00

Reset value: 0x0000 8000

This section describes the OTG\_DOEPCTL0 register. Nonzero control endpoints use registers for endpoints 1–3.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

w	r			w	w					rs	rw	r	r	r	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
USBA EP	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MPSIZ[1:0]	
r														r	r

Bit 31 **EPENA**: Endpoint enable

The application sets this bit to start transmitting data on endpoint 0.

The core clears this bit before setting any of the following interrupts on this endpoint:

- SETUP phase done
- Endpoint disabled
- Transfer completed

Bit 30 **EPDIS**: Endpoint disable

The application cannot disable control OUT endpoint 0.

Bits 29:28 Reserved, must be kept at reset value.

- Bit 27 **SNAK**: Set NAK  
A write to this bit sets the NAK bit for the endpoint.  
Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit on a transfer completed interrupt, or after a SETUP is received on the endpoint.
- Bit 26 **CNAK**: Clear NAK  
A write to this bit clears the NAK bit for the endpoint.
- Bits 25:22 Reserved, must be kept at reset value.
- Bit 21 **STALL**: STALL handshake  
The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.
- Bit 20 **SNPM**: Snoop mode  
This bit configures the endpoint to Snoop mode. In Snoop mode, the core does not check the correctness of OUT packets before transferring them to application memory.
- Bits 19:18 **EPTYP[1:0]**: Endpoint type  
Hardcoded to 2'b00 for control.
- Bit 17 **NAKSTS**: NAK status  
Indicates the following:  
0: The core is transmitting non-NAK handshakes based on the FIFO status.  
1: The core is transmitting NAK handshakes on this endpoint.  
When either the application or the core sets this bit, the core stops receiving data, even if there is space in the Rx FIFO to accommodate the incoming packet. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.
- Bit 16 Reserved, must be kept at reset value.
- Bit 15 **USBAEP**: USB active endpoint  
This bit is always set to 1, indicating that a control endpoint 0 is always active in all configurations and interfaces.
- Bits 14:2 Reserved, must be kept at reset value.
- Bits 1:0 **MPSIZ[1:0]**: Maximum packet size  
The maximum packet size for control OUT endpoint 0 is the same as what is programmed in control IN endpoint 0.  
00: 64 bytes  
01: 32 bytes  
10: 16 bytes  
11: 8 bytes

### 62.14.61 OTG device OUT endpoint x interrupt register (OTG\_DOEPINTx)

Address offset: 0xB08 + 0x20 \* x, (x = 0 to 8)

Reset value: 0x0000 0080

This register indicates the status of an endpoint with respect to USB- and AHB-related events. It is shown in *Figure 727*. The application must read this register when the OUT endpoints interrupt bit of the OTG\_GINTSTS register (OEPINT bit in OTG\_GINTSTS) is set. Before the application can read this register, it must first read the OTG\_DAIN register to get the exact endpoint number for the OTG\_DOEPINTx register. The application must clear the appropriate bit in this register to clear the corresponding bits in the OTG\_DAIN and OTG\_GINTSTS registers.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
STPK TRX	NYET	NAK	BERR	Res.	Res.	BNA	OUT PKT ERR	Res.	B2B STUP	STSPH SRX	OEP DIS	STUP	AHB ERR	EP DISD	XFRC
rc_w1	rc_w1	rc_w1	rc_w1			rc_w1	rc_w1		rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **STPKTRX**: Setup packet received

Applicable for control OUT endpoints in only in the Buffer DMA Mode. Set by the OTG\_HS, this bit indicates that this buffer holds 8 bytes of setup data. There is only one setup packet per buffer. On receiving a setup packet, the OTG\_HS closes the buffer and disables the corresponding endpoint after SETUP\_COMPLETE status is seen in the Rx FIFO. OTG\_HS puts a SETUP\_COMPLETE status into the Rx FIFO when it sees the first IN or OUT token after the SETUP packet for that particular endpoint. The application must then re-enable the endpoint to receive any OUT data for the control transfer and reprogram the buffer start address. Because of the above behavior, OTG\_HS can receive any number of back to back setup packets and one buffer for every setup packet is used.

Bit 14 **NYET**: NYET interrupt

This interrupt is generated when a NYET response is transmitted for a non isochronous OUT endpoint.

Bit 13 **NAK**: NAK input

The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to unavailability of data in the Tx FIFO.

Bit 12 **BERR**: Babble error interrupt

The core generates this interrupt when babble is received for the endpoint.

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **BNA**: Buffer not available interrupt

The core generates this interrupt when the descriptor accessed is not ready for the core to process, such as host busy or DMA done. This bit is only valid when Scatter/Gather DMA mode is enabled.

- Bit 8 **OUTPKTERR**: OUT packet error  
This interrupt is asserted when the core detects an overflow or a CRC error for an OUT packet. This interrupt is valid only when thresholding is enabled.
- Bit 7 Reserved, must be kept at reset value.
- Bit 6 **B2BSTUP**: Back-to-back SETUP packets received  
Applies to control OUT endpoint only.  
This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint.
- Bit 5 **STSPHSRX**: Status phase received for control write  
This interrupt is valid only for control OUT endpoints. This interrupt is generated only after OTG\_HS has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a control write transfer. The application can use this interrupt to ACK or STALL the status phase, after it has decoded the data phase.
- Bit 4 **OTEPDIS**: OUT token received when endpoint disabled  
Applies only to control OUT endpoints.  
Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received.
- Bit 3 **STUP**: SETUP phase done  
Applies to control OUT endpoint only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet.
- Bit 2 **AHBERR**: AHB error  
This is generated only in internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address.
- Bit 1 **EPDISD**: Endpoint disabled interrupt  
This bit indicates that the endpoint is disabled per the application's request.
- Bit 0 **XFRC**: Transfer completed interrupt  
This field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.

### 62.14.62 OTG device OUT endpoint 0 transfer size register (OTG\_DOEPTSIZ0)

Address offset: 0xB10

Reset value: 0x0000 0000

The application must modify this register before enabling endpoint 0. Once endpoint 0 is enabled using the endpoint enable bit in the OTG\_DOEPCTL0 registers (EPENA bit in OTG\_DOEPCTL0), the core modifies this register. The application can only read this register once the core has cleared the endpoint enable bit.

Nonzero endpoints use the registers for endpoints 1–8.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	STUPCNT[1:0]		Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PKTCNT	Res.	Res.	Res.
	rw	rw										rw			
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	XFRSIZ[6:0]						
									rw	rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:29 **STUPCNT[1:0]**: SETUP packet count

This field specifies the number of back-to-back SETUP data packets the endpoint can receive.

- 01: 1 packet
- 10: 2 packets
- 11: 3 packets

Bits 28:20 Reserved, must be kept at reset value.

Bit 19 **PKTCNT**: Packet count

This field is decremented to zero after a packet is written into the Rx FIFO.

Bits 18:7 Reserved, must be kept at reset value.

Bits 6:0 **XFRSIZ[6:0]**: Transfer size

Indicates the transfer size in bytes for endpoint 0. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be set to the maximum packet size of the endpoint, to be interrupted at the end of each packet.

The core decrements this field every time a packet is read from the Rx FIFO and written to the external memory.

**62.14.63 OTG device OUT endpoint x DMA address register (OTG\_DOEPDMAx)**

Address offset: 0xB14 + 0x20 \* x, (x = 0 to 8)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

DMAADDR[15:0]															
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

Bits 31:0 **DMAADDR[31:0]**: DMA Address

This field holds the start address in the external memory from which the data for the endpoint must be fetched. This register is incremented on every AHB transaction.

**62.14.64 OTG device OUT endpoint x control register (OTG\_DOEPCTLx)**

Address offset: 0xB00 + 0x20 \* x, (x = 1 to 8)

Reset value: 0x0000 0000

The application uses this register to control the behavior of each logical endpoint other than endpoint 0.

rW					rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

- Bit 31 **EPENA**: Endpoint enable  
Applies to IN and OUT endpoints.  
The application sets this bit to start transmitting data on an endpoint.  
The core clears this bit before setting any of the following interrupts on this endpoint:
- SETUP phase done
  - Endpoint disabled
  - Transfer completed
- Bit 30 **EPDIS**: Endpoint disable  
The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the endpoint disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the endpoint disabled interrupt. The application must set this bit only if endpoint enable is already set for this endpoint.
- Bit 29 **SD1PID**: Set DATA1 PID  
Applies to interrupt/bulk IN and OUT endpoints only. Writing to this field sets the endpoint data PID (DPID) field in this register to DATA1.
- SODDFRM**: Set odd frame  
Applies to isochronous IN and OUT endpoints only. Writing to this field sets the Even/Odd frame (EONUM) field to odd frame.
- Bit 28 **SD0PID**: Set DATA0 PID  
Applies to interrupt/bulk OUT endpoints only.  
Writing to this field sets the endpoint data PID (DPID) field in this register to DATA0.
- SEVNFRM**: Set even frame  
Applies to isochronous OUT endpoints only.  
Writing to this field sets the Even/Odd frame (EONUM) field to even frame.
- Bit 27 **SNAK**: Set NAK  
A write to this bit sets the NAK bit for the endpoint.  
Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for OUT endpoints on a transfer completed interrupt, or after a SETUP is received on the endpoint.
- Bit 26 **CNAK**: Clear NAK  
A write to this bit clears the NAK bit for the endpoint.
- Bits 25:22 Reserved, must be kept at reset value.
- Bit 21 **STALL**: STALL handshake  
Applies to non-control, non-isochronous OUT endpoints only (access type is rw).  
The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core.  
Applies to control endpoints only (access type is rs).  
The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.
- Bit 20 **SNPM**: Snoop mode  
This bit configures the endpoint to Snoop mode. In Snoop mode, the core does not check the correctness of OUT packets before transferring them to application memory.

Bits 19:18 **EPTYP[1:0]**: Endpoint type

This is the transfer type supported by this logical endpoint.

- 00: Control
- 01: Isochronous
- 10: Bulk
- 11: Interrupt

Bit 17 **NAKSTS**: NAK status

Indicates the following:

- 0: The core is transmitting non-NAK handshakes based on the FIFO status.
- 1: The core is transmitting NAK handshakes on this endpoint.

When either the application or the core sets this bit:

The core stops receiving any data on an OUT endpoint, even if there is space in the Rx FIFO to accommodate the incoming packet.

Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.

Bit 16 **EONUM**: Even/odd frame

Applies to isochronous IN and OUT endpoints only.

Indicates the frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd frame number in which it intends to transmit/receive isochronous data for this endpoint using the SEVNFRM and SODDFRM fields in this register.

- 0: Even frame
- 1: Odd frame

**DPID**: Endpoint data PID

Applies to interrupt/bulk OUT endpoints only.

Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The application uses the SD0PID register field to program either DATA0 or DATA1 PID.

- 0: DATA0
- 1: DATA1

Bit 15 **USBAEP**: USB active endpoint

Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit.

## Bits 14:11 Reserved, must be kept at reset value.

Bits 10:0 **MPSIZ[10:0]**: Maximum packet size

The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.

### 62.14.65 OTG device OUT endpoint x transfer size register (OTG\_DOEPTSIZx)

Address offset: 0xB10 + 0x20 \* x, (x = 1 to 8)

Reset value: 0x0000 0000

The application must modify this register before enabling the endpoint. Once the endpoint is enabled using endpoint enable bit of the OTG\_DOEPCTLx registers (EPENA bit in OTG\_DOEPCTLx), the core modifies this register. The application can only read this register once the core has cleared the endpoint enable bit.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	RXDPID/ STUPCNT[1:0]		PKTCNT[9:0]										XFRSIZ[18:16]		
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
XFRSIZ[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:29 **RXDPID[1:0]**: Received data PID

Applies to isochronous OUT endpoints only.

This is the data PID received in the last packet for this endpoint.

00: DATA0

01: DATA2

10: DATA1

11: MDATA

**STUPCNT[1:0]**: SETUP packet count

Applies to control OUT endpoints only.

This field specifies the number of back-to-back SETUP data packets the endpoint can receive.

01: 1 packet

10: 2 packets

11: 3 packets

Bits 28:19 **PKTCNT[9:0]**: Packet count

Indicates the total number of USB packets that constitute the transfer size amount of data for this endpoint.

This field is decremented every time a packet (maximum size or short packet) is written to the Rx FIFO.

Bits 18:0 **XFRSIZ[18:0]**: Transfer size

This field contains the transfer size in bytes for the current endpoint. The core only interrupts the application after it has exhausted the transfer size amount of data. The transfer size can be set to the maximum packet size of the endpoint, to be interrupted at the end of each packet.

The core decrements this field every time a packet is read from the Rx FIFO and written to the external memory.

**62.14.66 OTG power and clock gating control register (OTG\_PCGCCTL)**

Address offset: 0xE00

Reset value: 0x200B 8000

This register is available in host and device modes.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

								r	r	rw	r			rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **SUSP**: Deep Sleep

This bit indicates that the PHY is in Deep Sleep when in L1 state.

Bit 6 **PHYSLEEP**: PHY in Sleep

This bit indicates that the PHY is in the Sleep state.

Bit 5 **ENL1GTG**: Enable sleep clock gating

When this bit is set, core internal clock gating is enabled in Sleep state if the core cannot assert utmi\_l1\_suspend\_n. When this bit is not set, the PHY clock is not gated in Sleep state.

Bit 4 **PHYSUSP**: PHY suspended

Indicates that the PHY has been suspended. This bit is updated once the PHY is suspended after the application has set the STPPCLK bit.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **GATEHCLK**: Gate HCLK

The application sets this bit to gate HCLK to modules other than the AHB Slave and Master and wakeup logic when the USB is suspended or the session is not valid. The application clears this bit when the USB is resumed or a new session starts.

Bit 0 **STPPCLK**: Stop PHY clock

The application sets this bit to stop the PHY clock when the USB is suspended, the session is not valid, or the device is disconnected. The application clears this bit when the USB is resumed or a new session starts.

62.14.67 OTG\_HS register map

The table below gives the USB OTG register map and reset values.

Table 510. OTG\_HS register map and reset values

## 62.15 OTG\_HS programming model

### 62.15.1 Core initialization

The application must perform the core initialization sequence. If the cable is connected during power-up, the current mode of operation bit in the OTG\_GINTSTS (CMOD bit in OTG\_GINTSTS) reflects the mode. The OTG\_HS controller enters host mode when an “A” plug is connected or device mode when a “B” plug is connected.

This section explains the initialization of the OTG\_HS controller after power-on. The application must follow the initialization sequence irrespective of host or device mode operation. All core global registers are initialized according to the core’s configuration:

1. Program the following fields in the OTG\_GAHBCFG register:
  - Global interrupt mask bit GINTMSK = 1
  - Rx FIFO non-empty (RXFLVL bit in OTG\_GINTSTS)
  - Periodic Tx FIFO empty level
2. Program the following fields in the OTG\_GUSBCFG register:
  - HNP capable bit
  - SRP capable bit
  - OTG\_HS timeout calibration field
  - USB turnaround time field
3. The software must unmask the following bits in the OTG\_GINTMSK register:
  - OTG interrupt mask
  - Mode mismatch interrupt mask
4. The software can read the CMOD bit in OTG\_GINTSTS to determine whether the OTG\_HS controller is operating in host or device mode.

## 62.15.2 Host initialization

To initialize the core as host, the application must perform the following steps:

1. Program the HPRTINT in the OTG\_GINTMSK register to unmask
2. Program the OTG\_HCFG register to select full-speed host
3. Program the PPWR bit in OTG\_HPRT to 1. This drives  $V_{BUS}$  on the USB.
4. Wait for the PCDET interrupt in OTG\_HPRT0. This indicates that a device is connecting to the port.
5. Program the PRST bit in OTG\_HPRT to 1. This starts the reset process.
6. Wait at least 10 ms for the reset process to complete.
7. Program the PRST bit in OTG\_HPRT to 0.
8. Wait for the PENCHNG interrupt in OTG\_HPRT.
9. Read the PSPD bit in OTG\_HPRT to get the enumerated speed.
10. Program the HFIR register with a value corresponding to the selected PHY clock 1
11. Program the FLSLPCS field in the OTG\_HCFG register following the speed of the device detected in step 9. If FLSLPCS has been changed a port reset must be performed.
12. Program the OTG\_GRXFSIZ register to select the size of the receive FIFO.
13. Program the OTG\_HNPTXFSIZ register to select the size and the start address of the Non-periodic transmit FIFO for non-periodic transactions.
14. Program the OTG\_HPTXFSIZ register to select the size and start address of the periodic transmit FIFO for periodic transactions.

To communicate with devices, the system software must initialize and enable at least one channel.

### 62.15.3 Device initialization

The application must perform the following steps to initialize the core as a device on power-up or after a mode change from host to device.

1. Program the following fields in the OTG\_DCFG register:
  - DESCDMA
  - Device speed
  - Non-zero-length status OUT handshake
  - Periodic Frame Interval
2. Program the Device threshold control register. This is required only if you are using DMA mode and you are planning to enable thresholding.
3. Clear the DCTL.SDIS bit. The core issues a connect after this bit is cleared.
4. Program the OTG\_GINTMSK register to unmask the following interrupts:
  - USB reset
  - Enumeration done
  - Early suspend
  - USB suspend
  - SOF
5. Wait for the USBRST interrupt in OTG\_GINTSTS. It indicates that a reset has been detected on the USB that lasts for about 10 ms on receiving this interrupt.
6. Wait for the ENUMDNE interrupt in OTG\_GINTSTS. This interrupt indicates the end of reset on the USB. On receiving this interrupt, the application must read the OTG\_DSTS register to determine the enumeration speed and perform the steps listed in [Endpoint initialization on enumeration completion on page 2680](#).

At this point, the device is ready to accept SOF packets and perform control transfers on control endpoint 0.

### 62.15.4 DMA mode

The OTG host uses the AHB master interface to fetch the transmit packet data (AHB to USB) and receive the data update (USB to AHB). The AHB master uses the programmed DMA address (OTG\_HCDMAx register in host mode and OTG\_DIEPDMAx/OTG\_DOEPDMAx register in peripheral mode) to access the data buffers.

#### Scatter/Gather DMA mode

In Scatter/Gather DMA mode, the core implements a true scatter/gather memory distribution in which data buffers are scattered over the system memory. However, the descriptors themselves are continuous. Each channel memory structure is implemented as a contiguous list of descriptors; each descriptor points to a data buffer of predefined size. In addition to the buffer pointer (a 32-bit word), the descriptor also has a status quadlet (32-bit word). When the list is implemented as a ring buffer, the list processor switches to the first element of the list when it encounters last bit. All channels (control, bulk, interrupt, and isochronous) implement these structures in memory. When Scatter/Gather DMA is enabled in device mode, OTG\_DIEPDMAx and OTG\_DOEPDMAx registers are used to access the base descriptor.

## 62.15.5 Host programming model

### Channel initialization

The application must initialize one or more channels before it can communicate with connected devices. To initialize and enable a channel, the application must perform the following steps:

1. Program the OTG\_GINTMSK register to unmask the following:
2. Channel interrupt
  - Non-periodic transmit FIFO empty for OUT transactions (applicable when operating in pipelined transaction-level with the packet count field programmed with more than one).
  - Non-periodic transmit FIFO half-empty for OUT transactions (applicable when operating in pipelined transaction-level with the packet count field programmed with more than one).
3. Program the OTG\_HAINTMSK register to unmask the selected channels' interrupts.
4. Program the OTG\_HCINTMSK register to unmask the transaction-related interrupts of interest given in the host channel interrupt register.
5. Program the selected channel's OTG\_HCTSIZx register with the total transfer size, in bytes, and the expected number of packets, including short packets. The application must program the PID field with the initial data PID (to be used on the first OUT transaction or to be expected from the first IN transaction).
6. Program the OTG\_HCCHARx register of the selected channel with the device's endpoint characteristics, such as type, speed, direction, and so forth. (The channel can be enabled by setting the channel enable bit to 1 only when the application is ready to transmit or receive any packet).
7. Program the selected channels in the OTG\_HCSPLTx register(s) with the hub and port addresses (split transactions only).
8. Program the selected channels in the OTG\_HCDMAx register(s) with the buffer start address (DMA transactions only).

### Halting a channel

The application can disable any channel by programming the OTG\_HCCHARx register with the CHDIS and CHENA bits set to 1. This enables the OTG\_HS host to flush the posted requests (if any) and generates a channel halted interrupt. The application must wait for the CHH interrupt in OTG\_HCINTx before reallocating the channel for other transactions. The OTG\_HS host does not interrupt the transaction that has already been started on the USB.

To disable a channel in DMA mode operation, the application does not need to check for space in the request queue. The OTG\_HS host checks for space to write the disable request on the disabled channel's turn during arbitration. Meanwhile, all posted requests are dropped from the request queue when the CHDIS bit in OTG\_HCCHARx is set to 1.

Before disabling a channel, the application must ensure that there is at least one free space available in the non-periodic request queue (when disabling a non-periodic channel) or the periodic request queue (when disabling a periodic channel). The application can simply flush the posted requests when the request queue is full (before disabling the channel), by programming the OTG\_HCCHARx register with the CHDIS bit set to 1 which automatically clears the CHENA bit to 0.

The application is expected to disable a channel on any of the following conditions:

1. When an STALL, TXERR, BBERR or DTERR interrupt in OTG\_HCINTx is received for an IN or OUT channel. The application must be able to receive other interrupts (DTERR, Nak, data, TXERR) for the same channel before receiving the halt.
2. When an XFRC interrupt in OTG\_HCINTx is received during a non periodic IN transfer or high-bandwidth interrupt IN transfer
3. When a DISCINT (disconnect device) interrupt in OTG\_GINTSTS is received. (The application is expected to disable all enabled channels).
4. When the application aborts a transfer before normal completion.

### Ping protocol

When the OTG\_HS host operates in high speed, the application must initiate the ping protocol when communicating with high-speed bulk or control (data and status stage) OUT endpoints. The application must initiate the ping protocol when it receives a NAK/NYET/TXERR interrupt. When the OTG\_HS host receives one of the above responses, it does not continue any transaction for a specific endpoint, drops all posted or fetched OUT requests (from the request queue), and flushes the corresponding data (from the transmit FIFO). This is valid in slave mode only. In Slave mode, the application can send a ping token either by setting the DOPING bit in OTG\_HCTSIZx before enabling the channel or by just writing the OTG\_HCTSIZx register with the DOPING bit set when the channel is already enabled. This enables the OTG\_HS host to write a ping request entry to the request queue. The application must wait for the response to the ping token (a NAK, ACK, or TXERR interrupt) before continuing the transaction or sending another ping token. The application can continue the data transaction only after receiving an ACK from the OUT endpoint for the requested ping. In DMA mode operation, the application does not need to set the DOPING bit in OTG\_HCTSIZx for a NAK/NYET response in case of bulk/control OUT. The OTG\_HS host automatically sets the DOPING bit in OTG\_HCTSIZx, and issues the ping tokens for bulk/control OUT. The OTG\_HS host continues sending ping tokens until it receives an ACK, and then switches automatically to the data transaction.

### Operational model

The application must initialize a channel before communicating to the connected device. This section explains the sequence of operation to be performed for different types of USB transactions.

- **Writing the transmit FIFO**

The OTG\_HS host automatically writes an entry (OUT request) to the periodic/non-periodic request queue, along with the last 32-bit word write of a packet. The application must ensure that at least one free space is available in the periodic/non-periodic request queue before starting to write to the transmit FIFO. The application must always write to the transmit FIFO in 32-bit words. If the packet size is non-32-bit word aligned, the application must use padding. The OTG\_HS host determines the actual packet size based on the programmed maximum packet size and transfer size.

Figure 728. Transmit FIFO write task

- Reading the receive FIFO**  
 The application must ignore all packet statuses other than IN data packet (bx0010).

Figure 729. Receive FIFO read task

- **Bulk and control OUT/SETUP transactions**

A typical bulk or control OUT/SETUP pipelined transaction-level operation is shown in [Figure 730](#). See channel 1 (ch\_1). Two bulk OUT packets are transmitted. A control SETUP transaction operates in the same way but has only one packet. The assumptions are:

- The application is attempting to send two maximum-packet-size packets (transfer size = 1,024 bytes).
- The non-periodic transmit FIFO can hold two packets (1 Kbyte for HS).
- The non-periodic request queue depth = 4.

- **Normal bulk and control OUT/SETUP operations**

The sequence of operations in (channel 1) is as follows:

1. Initialize channel 1
2. Write the first packet for channel 1
3. Along with the last word write, the core writes an entry to the non-periodic request queue
4. As soon as the non-periodic queue becomes non-empty, the core attempts to send an OUT token in the current frame
5. Write the second (last) packet for channel 1
6. The core generates the XFRC interrupt as soon as the last transaction is completed successfully
7. In response to the XFRC interrupt, de-allocate the channel for other transfers
8. Handling non-ACK responses

Figure 730. Normal bulk/control OUT/SETUP

1. The grayed elements are not relevant in the context of this figure.

The channel-specific interrupt service routine for bulk and control OUT/SETUP transactions is shown in the following code samples.

- **Interrupt service routine for bulk/control OUT/SETUP and bulk/control IN transactions**

a) Bulk/control OUT/SETUP

```

Unmask (NAK/TXERR/STALL/XFRC)
if (XFRC)
{
    Reset Error Count
    Mask ACK
    De-allocate Channel
}
else if (STALL)
{
    Transfer Done = 1
    Unmask CHH
    Disable Channel
}
else if (NAK or TXERR )
{
    Rewind Buffer Pointers
    Unmask CHH
    Disable Channel
    if (TXERR)
    {
        Increment Error Count
        Unmask ACK
    }
    else
    {
        Reset Error Count
    }
}
else if (CHH)
{
    Mask CHH
    if (Transfer Done or (Error_count == 3))
    {
        De-allocate Channel
    }
    else
    {
        Re-initialize Channel
    }
}

```

```

else if (ACK)
{
Reset Error Count
Mask ACK
}

```

The application is expected to write the data packets into the transmit FIFO when the space is available in the transmit FIFO and the request queue. The application can make use of the NPTXFE interrupt in OTG\_GINTSTS to find the transmit FIFO space.

b) Bulk/control IN

```

Unmask (TXERR/XFRC/BBERR/STALL/DTERR)
if (XFRC)
{
Reset Error Count
Unmask CHH
Disable Channel
Reset Error Count
Mask ACK
}
else if (TXERR or BBERR or STALL)
{
Unmask CHH
Disable Channel
if (TXERR)
{
Increment Error Count
Unmask ACK
}
}
else if (CHH)
{
Mask CHH
if (Transfer Done or (Error_count == 3))
{
De-allocate Channel
}
else
{
Re-initialize Channel
}
}
else if (ACK)
{
Reset Error Count
Mask ACK
}

```

```
else if (DTERR)
{
    Reset Error Count
}
```

The application is expected to write the requests as and when the request queue space is available and until the XFRC interrupt is received.

- **Bulk and control IN transactions**

A typical bulk or control IN pipelined transaction-level operation is shown in [Figure 731](#). See channel 2 (ch\_2). The assumptions are:

- The application is attempting to receive two maximum-packet-size packets (transfer size = 1 024 bytes).
- The receive FIFO can contain at least one maximum-packet-size packet and two status words per packet (520 bytes for HS).
- The non-periodic request queue depth = 4.

Figure 731. Bulk/control IN transactions

1. The grayed elements are not relevant in the context of this figure.

The sequence of operations is as follows:

1. Initialize channel 2.
2. Set the CHENA bit in OTG\_HCCHAR2 to write an IN request to the non-periodic request queue.
3. The core attempts to send an IN token after completing the current OUT transaction.
4. The core generates an RXFLVL interrupt as soon as the received packet is written to the receive FIFO.
5. In response to the RXFLVL interrupt, mask the RXFLVL interrupt and read the received packet status to determine the number of bytes received, then read the receive FIFO accordingly. Following this, unmask the RXFLVL interrupt.
6. The core generates the RXFLVL interrupt for the transfer completion status entry in the receive FIFO.
7. The application must read and ignore the receive packet status when the receive packet status is not an IN data packet (PKTSTS in OTG\_GRXSTSR  $\neq$  0b0010).
8. The core generates the XFRC interrupt as soon as the receive packet status is read.
9. In response to the XFRC interrupt, disable the channel and stop writing the OTG\_HCCHAR2 register for further requests. The core writes a channel disable request to the non-periodic request queue as soon as the OTG\_HCCHAR2 register is written.
10. The core generates the RXFLVL interrupt as soon as the halt status is written to the receive FIFO.
11. Read and ignore the receive packet status.
12. The core generates a CHH interrupt as soon as the halt status is popped from the receive FIFO.
13. In response to the CHH interrupt, de-allocate the channel for other transfers.
14. Handling non-ACK responses
  - **Control transactions**

Setup, data, and status stages of a control transfer must be performed as three separate transfers. setup-, data- or status-stage OUT transactions are performed similarly to the bulk OUT transactions explained previously. Data- or status-stage IN transactions are performed similarly to the bulk IN transactions explained previously. For all three stages, the application is expected to set the EPTYP field in

OTG\_HCCHAR1 to control. During the setup stage, the application is expected to set the PID field in OTG\_HCTSIZ1 to SETUP.

- **Interrupt OUT transactions**

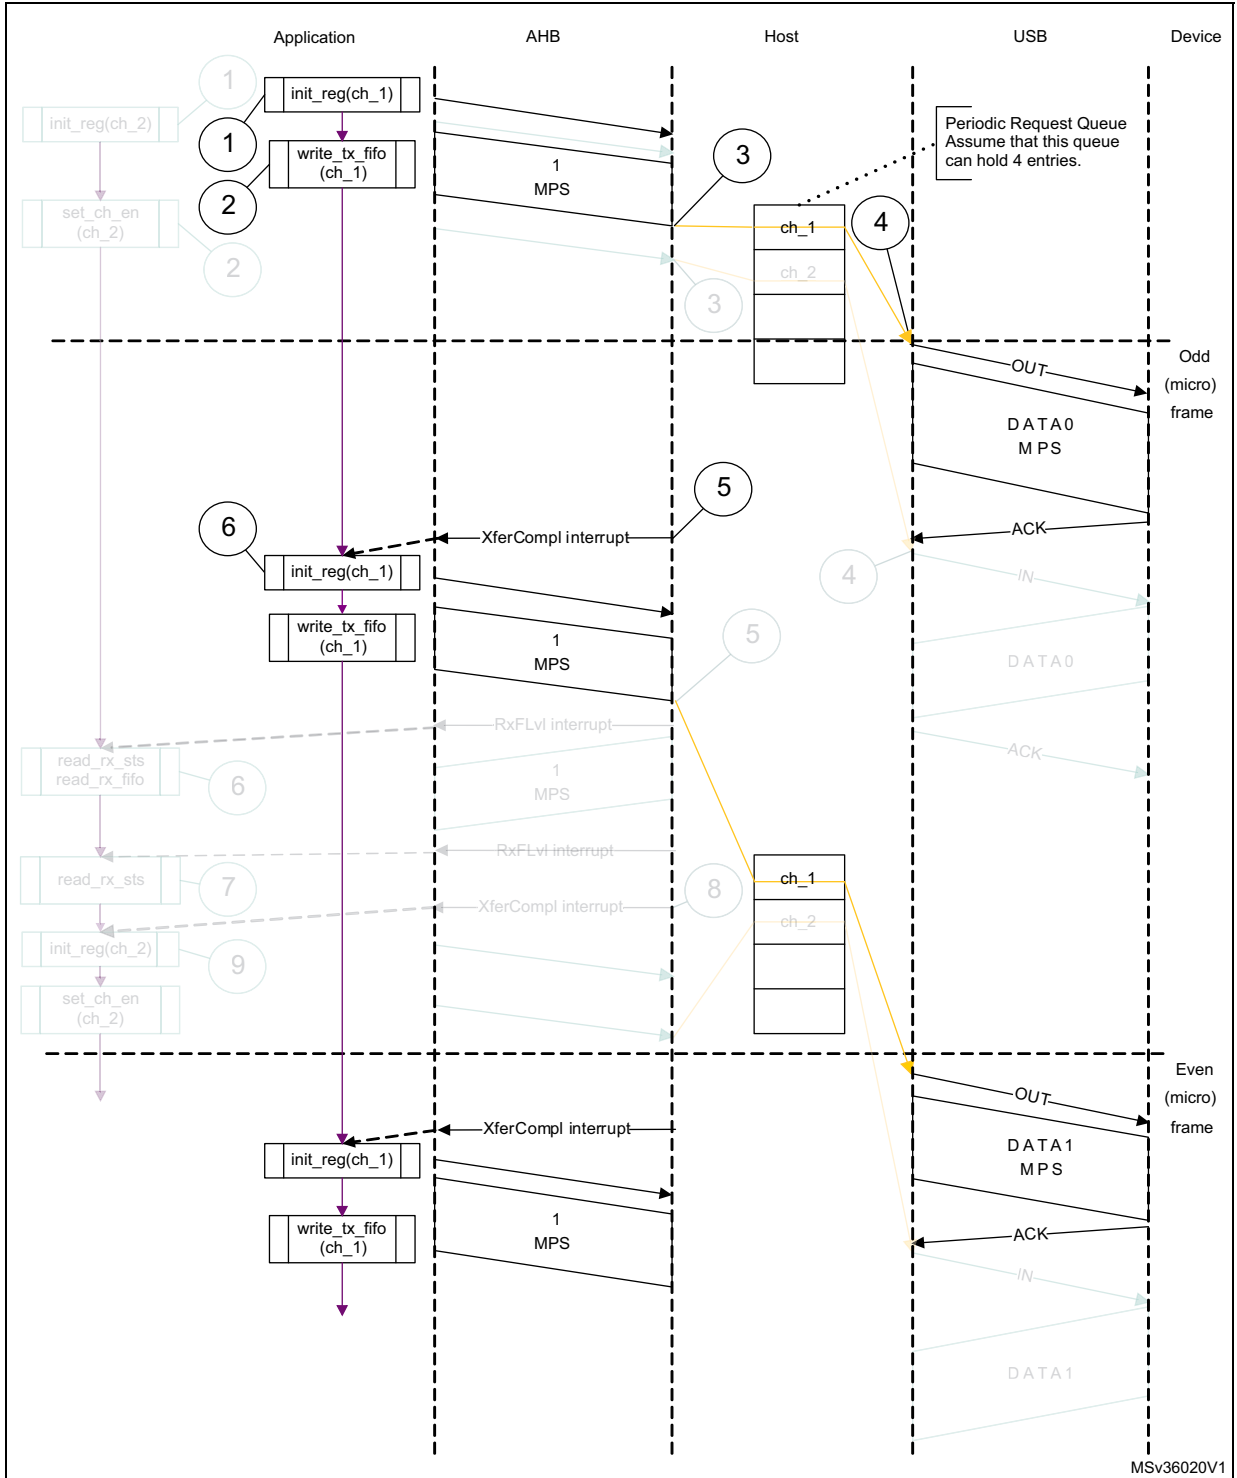

A typical interrupt OUT operation is shown in [Figure 732](#). The assumptions are:

- The application is attempting to send one packet in every frame (up to 1 maximum packet size), starting with the odd frame (transfer size = 1 024 bytes)
- The periodic transmit FIFO can hold one packet (1 Kbyte)
- Periodic request queue depth = 4

The sequence of operations is as follows:

1. Initialize and enable channel 1. The application must set the ODDFRM bit in OTG\_HCCHAR1.
2. Write the first packet for channel 1.
3. Along with the last word write of each packet, the OTG\_HS host writes an entry to the periodic request queue.
4. The OTG\_HS host attempts to send an OUT token in the next (odd) frame.
5. The OTG\_HS host generates an XFRC interrupt as soon as the last packet is transmitted successfully.
6. In response to the XFRC interrupt, reinitialize the channel for the next transfer.

Figure 732. Normal interrupt OUT

MSv36020V1

1. The grayed elements are not relevant in the context of this figure.

- **Interrupt service routine for interrupt OUT/IN transactions**

- a) **Interrupt OUT**

**Unmask (NAK/TXERR/STALL/XFRC/FRMOR)**

```
if (XFRC)
{
  Reset Error Count
  Mask ACK
  De-allocate Channel
}
else
  if (STALL or FRMOR)
  {
    Mask ACK
    Unmask CHH
    Disable Channel
    if (STALL)
    {
      Transfer Done = 1
    }
  }
  else
    if (NAK or TXERR)
    {
      Rewind Buffer Pointers
      Reset Error Count
      Mask ACK
      Unmask CHH
      Disable Channel
    }
    else
      if (CHH)
      {
        Mask CHH
        if (Transfer Done or (Error_count == 3))
        {
          De-allocate Channel
        }
        else
        {
          Re-initialize Channel (in next b_interval - 1 Frame)
        }
      }
    else
      if (ACK)
      {
        Reset Error Count
        Mask ACK
      }
```

The application uses the NPTXFE interrupt in OTG\_GINTSTS to find the transmit FIFO space.

Interrupt IN

Unmask (NAK/TXERR/XFRC/BBERR/STALL/FRMOR/DTERR)

```
if (XFRC)
{
  Reset Error Count
  Mask ACK
  if (OTG_HCTSIZx.PKTCNT == 0)
  {
    De-allocate Channel
  }
  else
  {
    Transfer Done = 1
    Unmask CHH
    Disable Channel
  }
}
else
  if (STALL or FRMOR or NAK or DTERR or BBERR)
  {
    Mask ACK
    Unmask CHH
    Disable Channel
    if (STALL or BBERR)
    {
      Reset Error Count
      Transfer Done = 1
    }
    else
      if (!FRMOR)
      {
        Reset Error Count
      }
  }
else
  if (TXERR)
  {
    Increment Error Count
    Unmask ACK
    Unmask CHH
    Disable Channel
  }
else
```

```

if (CHH)
{
Mask CHH
if (Transfer Done or (Error_count == 3))
{
De-allocate Channel
}
else
Re-initialize Channel (in next b_interval - 1 /Frame)
}
}
else
if (ACK)
{
Reset Error Count
Mask ACK
}

```

- **Interrupt IN transactions**

The assumptions are:

- The application is attempting to receive one packet (up to 1 maximum packet size) in every frame, starting with odd (transfer size = 1 024 bytes).
- The receive FIFO can hold at least one maximum-packet-size packet and two status words per packet (1 031 bytes).
- Periodic request queue depth = 4.

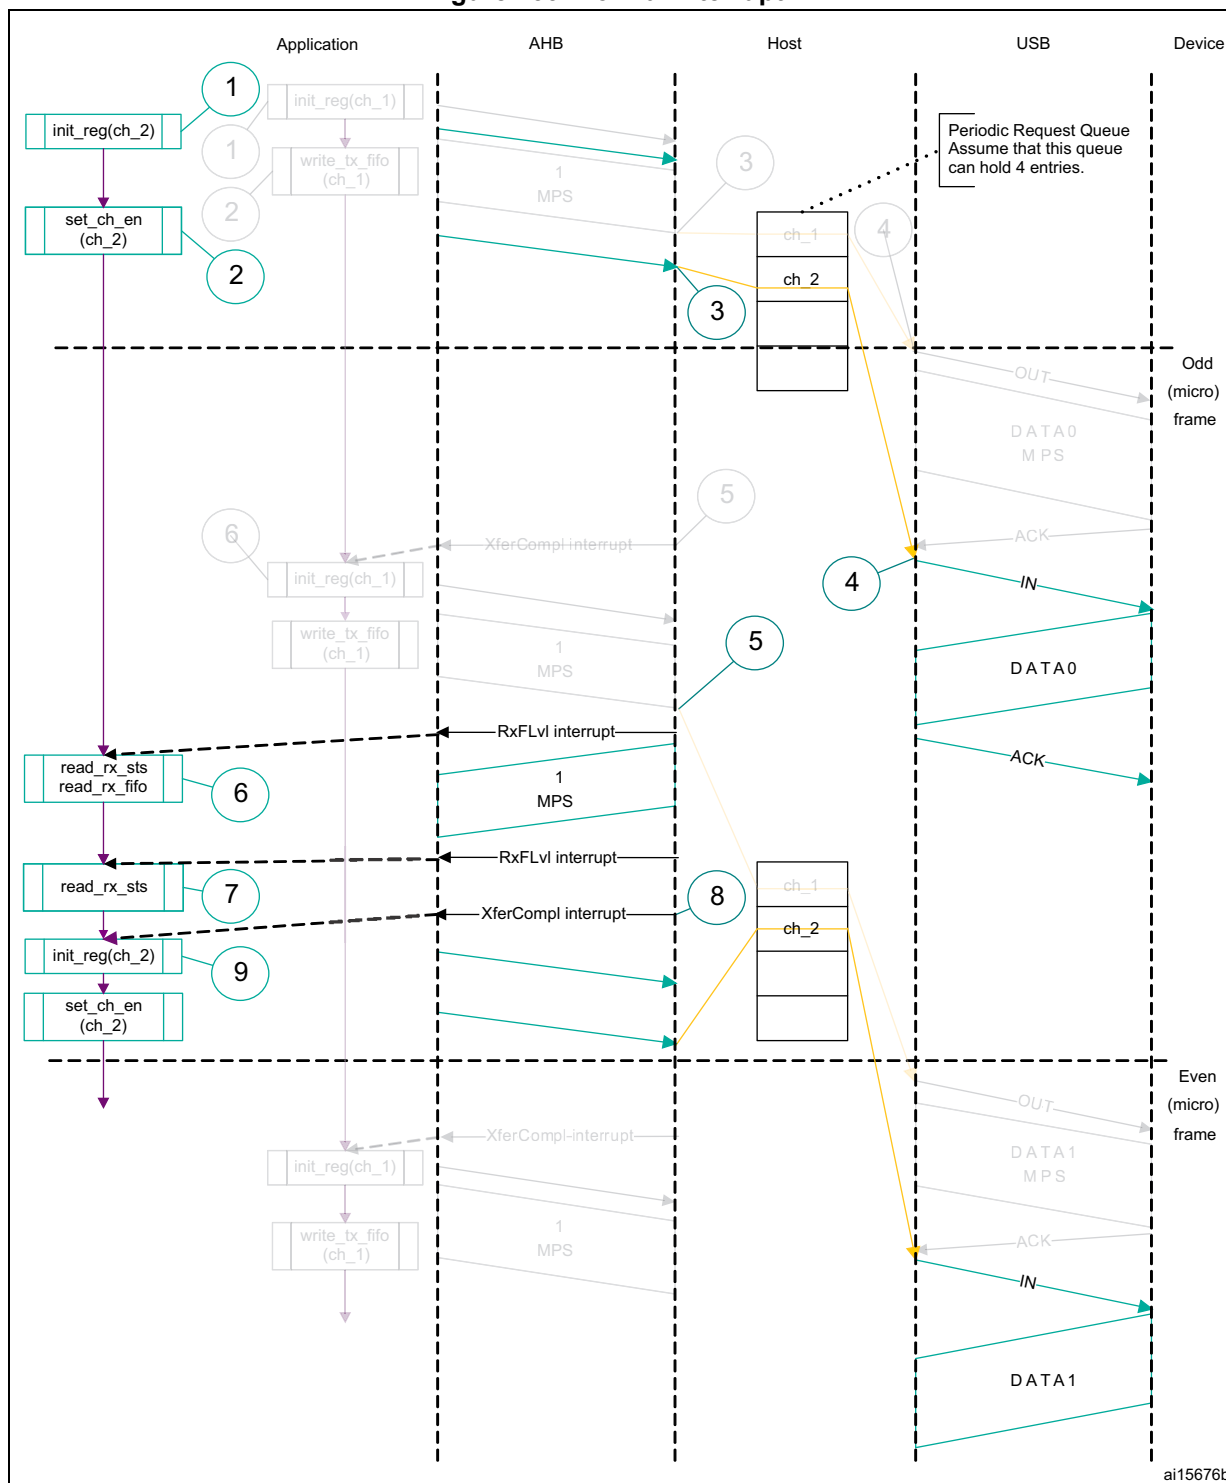

- **Normal interrupt IN operation**

The sequence of operations is as follows:

1. Initialize channel 2. The application must set the ODDFRM bit in OTG\_HCCHAR2.
2. Set the CHENA bit in OTG\_HCCHAR2 to write an IN request to the periodic request queue.
3. The OTG\_HS host writes an IN request to the periodic request queue for each OTG\_HCCHAR2 register write with the CHENA bit set.
4. The OTG\_HS host attempts to send an IN token in the next (odd) frame.
5. As soon as the IN packet is received and written to the receive FIFO, the OTG\_HS host generates an RXFLVL interrupt.
6. In response to the RXFLVL interrupt, read the received packet status to determine the number of bytes received, then read the receive FIFO accordingly. The application must mask the RXFLVL interrupt before reading the receive FIFO, and unmask after reading the entire packet.
7. The core generates the RXFLVL interrupt for the transfer completion status entry in the receive FIFO. The application must read and ignore the receive packet status when the receive packet status is not an IN data packet (PKTSTS in GRXSTSR ≠ 0b0010).
8. The core generates an XFRC interrupt as soon as the receive packet status is read.
9. In response to the XFRC interrupt, read the PKTCNT field in OTG\_HCTSIZ2. If the PKTCNT bit in OTG\_HCTSIZ2 is not equal to 0, disable the channel before re-

initializing the channel for the next transfer, if any). If PKTCNT bit in OTG\_HCTSIZ2 = 0, reinitialize the channel for the next transfer. This time, the application must reset the ODDFRM bit in OTG\_HCCHAR2.

Figure 733. Normal interrupt IN

1. The grayed elements are not relevant in the context of this figure.

- **Isochronous OUT transactions**

A typical isochronous OUT operation is shown in [Figure 734](#). The assumptions are:

- The application is attempting to send one packet every frame (up to 1 maximum

packet size), starting with an odd frame. (transfer size = 1 024 bytes).

- The periodic transmit FIFO can hold one packet (1 Kbyte).
- Periodic request queue depth = 4.

The sequence of operations is as follows:

1. Initialize and enable channel 1. The application must set the ODDFRM bit in OTG\_HCCHAR1.
2. Write the first packet for channel 1.
3. Along with the last word write of each packet, the OTG\_HS host writes an entry to the periodic request queue.
4. The OTG\_HS host attempts to send the OUT token in the next frame (odd).
5. The OTG\_HS host generates the XFRC interrupt as soon as the last packet is transmitted successfully.
6. In response to the XFRC interrupt, reinitialize the channel for the next transfer.
7. Handling non-ACK responses

- **Isochronous IN transactions**

The assumptions are:

- The application is attempting to receive one packet (up to 1 maximum packet size) in every frame starting with the next odd frame (transfer size = 1 024 bytes).
- The receive FIFO can hold at least one maximum-packet-size packet and two status word per packet (1 031 bytes).
- Periodic request queue depth = 4.

The sequence of operations is as follows:

1. Initialize channel 2. The application must set the ODDFRM bit in OTG\_HCCHAR2.
2. Set the CHENA bit in OTG\_HCCHAR2 to write an IN request to the periodic request queue.
3. The OTG\_HS host writes an IN request to the periodic request queue for each OTG\_HCCHAR2 register write with the CHENA bit set.
4. The OTG\_HS host attempts to send an IN token in the next odd frame.
5. As soon as the IN packet is received and written to the receive FIFO, the OTG\_HS host generates an RXFLVL interrupt.
6. In response to the RXFLVL interrupt, read the received packet status to determine the number of bytes received, then read the receive FIFO accordingly. The application must mask the RXFLVL interrupt before reading the receive FIFO, and unmask it after reading the entire packet.
7. The core generates an RXFLVL interrupt for the transfer completion status entry in the receive FIFO. This time, the application must read and ignore the receive packet status when the receive packet status is not an IN data packet (PKTSTS bit in OTG\_GRXSTSR ≠ 0b0010).
8. The core generates an XFRC interrupt as soon as the receive packet status is read.
9. In response to the XFRC interrupt, read the PKTCNT field in OTG\_HCTSIZ2. If PKTCNT ≠ 0 in OTG\_HCTSIZ2, disable the channel before re-initializing the channel for the next transfer, if any. If PKTCNT = 0 in OTG\_HCTSIZ2, reinitialize the channel for the next transfer. This time, the application must reset the ODDFRM bit in OTG\_HCCHAR2.

Figure 735. Isochronous IN transactions

1. The grayed elements are not relevant in the context of this figure.

- **Selecting the queue depth**

Choose the periodic and non-periodic request queue depths carefully to match the number of periodic/non-periodic endpoints accessed.

The non-periodic request queue depth affects the performance of non-periodic

transfers. The deeper the queue (along with sufficient FIFO size), the more often the core is able to pipeline non-periodic transfers. If the queue size is small, the core is able to put in new requests only when the queue space is freed up.

The core's periodic request queue depth is critical to perform periodic transfers as scheduled. Select the periodic queue depth, based on the number of periodic transfers scheduled in a microframe. If the periodic request queue depth is smaller than the periodic transfers scheduled in a microframe, a frame overrun condition occurs.

- **Handling babble conditions**

OTG\_HS controller handles two cases of babble: packet babble and port babble. Packet babble occurs if the device sends more data than the maximum packet size for the channel. Port babble occurs if the core continues to receive data from the device at EOF2 (the end of frame 2, which is very close to SOF).

When OTG\_HS controller detects a packet babble, it stops writing data into the Rx buffer and waits for the end of packet (EOP). When it detects an EOP, it flushes already written data in the Rx buffer and generates a Babble interrupt to the application.

When OTG\_HS controller detects a port babble, it flushes the Rx FIFO and disables the port. The core then generates a port disabled interrupt (HPRTINT in OTG\_GINTSTS, PENCHNG in OTG\_HPRT). On receiving this interrupt, the application must determine that this is not due to an overcurrent condition (another cause of the port disabled interrupt) by checking POCA in OTG\_HPRT, then perform a soft reset. The core does not send any more tokens after it has detected a port babble condition.

- **Bulk and control OUT/SETUP transactions in DMA mode**

The sequence of operations is as follows:

1. Initialize and enable channel 1 as explained in [Section : Channel initialization](#).
2. The OTG\_HS host starts fetching the first packet as soon as the channel is enabled. For internal DMA mode, the OTG\_HS host uses the programmed DMA address to fetch the packet.
3. After fetching the last 32-bit word of the second (last) packet, the OTG\_HS host masks channel 1 internally for further arbitration.
4. The OTG\_HS host generates a CHH interrupt as soon as the last packet is sent.
5. In response to the CHH interrupt, de-allocate the channel for other transfers.

Figure 736. Normal bulk/control OUT/SETUP transactions - DMA

- **NAK and NYET handling with internal DMA:**
  1. The OTG\_HS host sends a bulk OUT transaction.
  2. The device responds with NAK or NYET.
  3. If the application has unmasked NAK or NYET, the core generates the corresponding interrupt(s) to the application. The application is not required to service these interrupts, since the core takes care of rewinding the buffer pointers and re-initializing the Channel without application intervention.
  4. The core automatically issues a ping token.
  5. When the device returns an ACK, the core continues with the transfer. Optionally, the application can utilize these interrupts, in which case the NAK or NYET interrupt is masked by the application.

The core does not generate a separate interrupt when NAK or NYET is received by the host functionality.

- **Bulk and control IN transactions in DMA mode**

The sequence of operations is as follows:

1. Initialize and enable the used channel (channel x) as explained in [Section : Channel initialization](#).
2. The OTG\_HS host writes an IN request to the request queue as soon as the channel receives the grant from the arbiter (arbitration is performed in a round-robin fashion).
3. The OTG\_HS host starts writing the received data to the system memory as soon as the last byte is received with no errors.
4. When the last packet is received, the OTG\_HS host sets an internal flag to remove any extra IN requests from the request queue.
5. The OTG\_HS host flushes the extra requests.
6. The final request to disable channel x is written to the request queue. At this point, channel 2 is internally masked for further arbitration.
7. The OTG\_HS host generates the CHH interrupt as soon as the disable request comes to the top of the queue.
8. In response to the CHH interrupt, de-allocate the channel for other transfers.

Figure 737. Normal bulk/control IN transaction - DMA

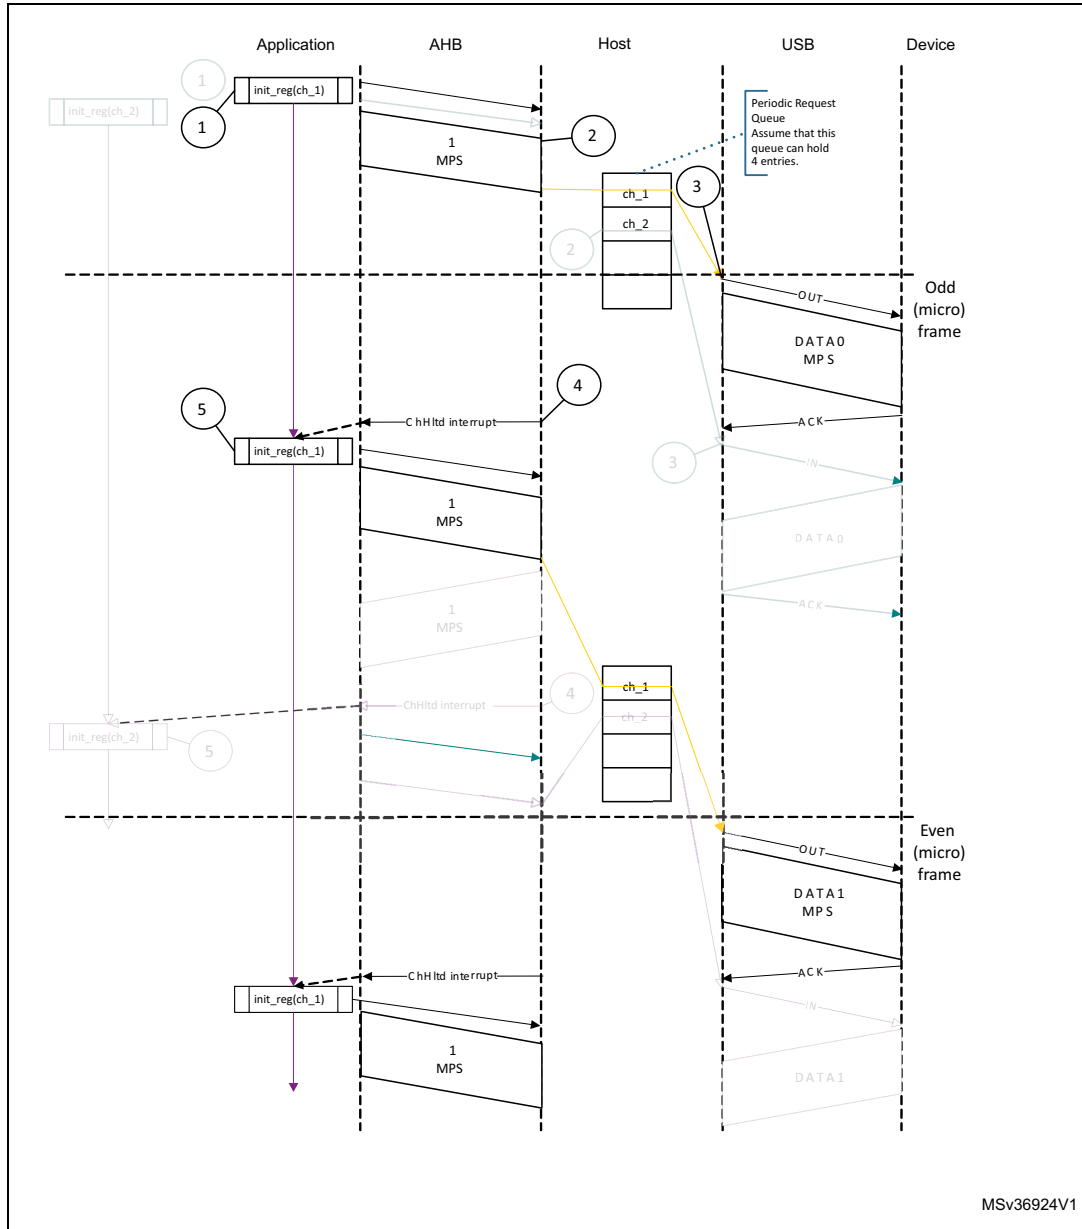

MSv36928V1

• **Interrupt OUT transactions in DMA mode**

1. Initialize and enable channel x as explained in [Section : Channel initialization](#).
2. The OTG\_HS host starts fetching the first packet as soon the channel is enabled and writes the OUT request along with the last 32-bit word fetch. In high-bandwidth transfers, the OTG\_HS host continues fetching the next packet (up to the value specified in the MC field) before switching to the next channel.
3. The OTG\_HS host attempts to send the OUT token at the beginning of the next odd frame/micro-frame.

4. After successfully transmitting the packet, the OTG\_HS host generates a CHH interrupt.
5. In response to the CHH interrupt, reinitialize the channel for the next transfer.

**Figure 738. Normal interrupt OUT transactions - DMA mode**

• **Interrupt IN transactions in DMA mode**

The sequence of operations (channelx) is as follows:

1. Initialize and enable channel x as explained in [Section : Channel initialization](#).
2. The OTG\_HS host writes an IN request to the request queue as soon as the channel x gets the grant from the arbiter (round-robin with fairness). In high-bandwidth transfers, the OTG\_HS host writes consecutive writes up to MC times.

3. The OTG\_HS host attempts to send an IN token at the beginning of the next (odd) frame/micro-frame.
4. As soon the packet is received and written to the receive FIFO, the OTG\_HS host generates a CHH interrupt.
5. In response to the CHH interrupt, reinitialize the channel for the next transfer.

**Figure 739. Normal interrupt IN transactions - DMA mode**

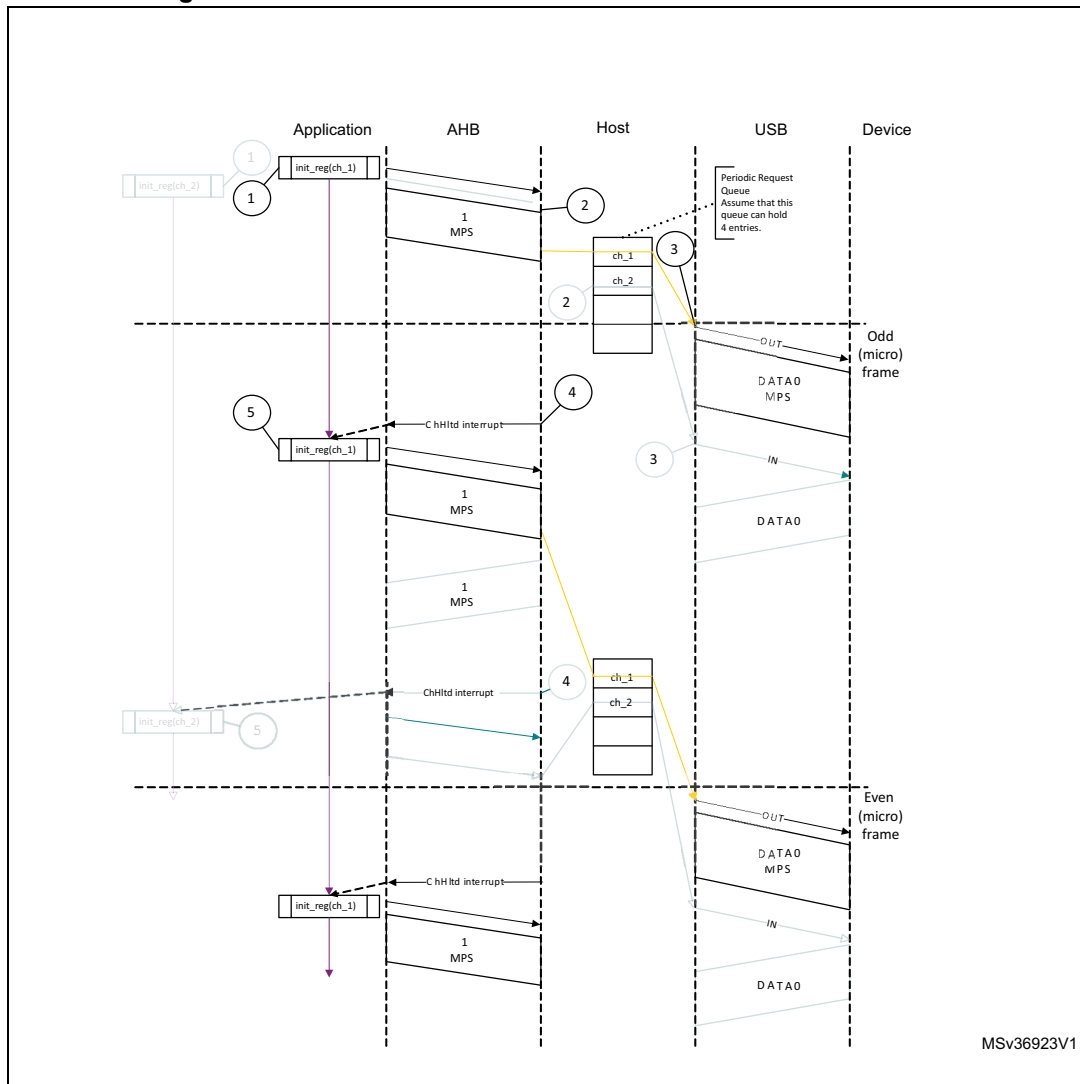

• **Isochronous OUT transactions in DMA mode**

1. Initialize and enable channel x as explained in [Section : Channel initialization](#).
2. The OTG\_HS host starts fetching the first packet as soon as the channel is enabled, and writes the OUT request along with the last 32-bit word fetch. In high-bandwidth

- transfers, the OTG\_HS host continues fetching the next packet (up to the value specified in the MC field) before switching to the next channel.
3. The OTG\_HS host attempts to send an OUT token at the beginning of the next (odd) frame/micro-frame.
4. After successfully transmitting the packet, the OTG\_HS host generates a CHHtd interrupt.
5. In response to the CHH interrupt, reinitialize the channel for the next transfer.

**Figure 740. Normal isochronous OUT transaction - DMA mode**

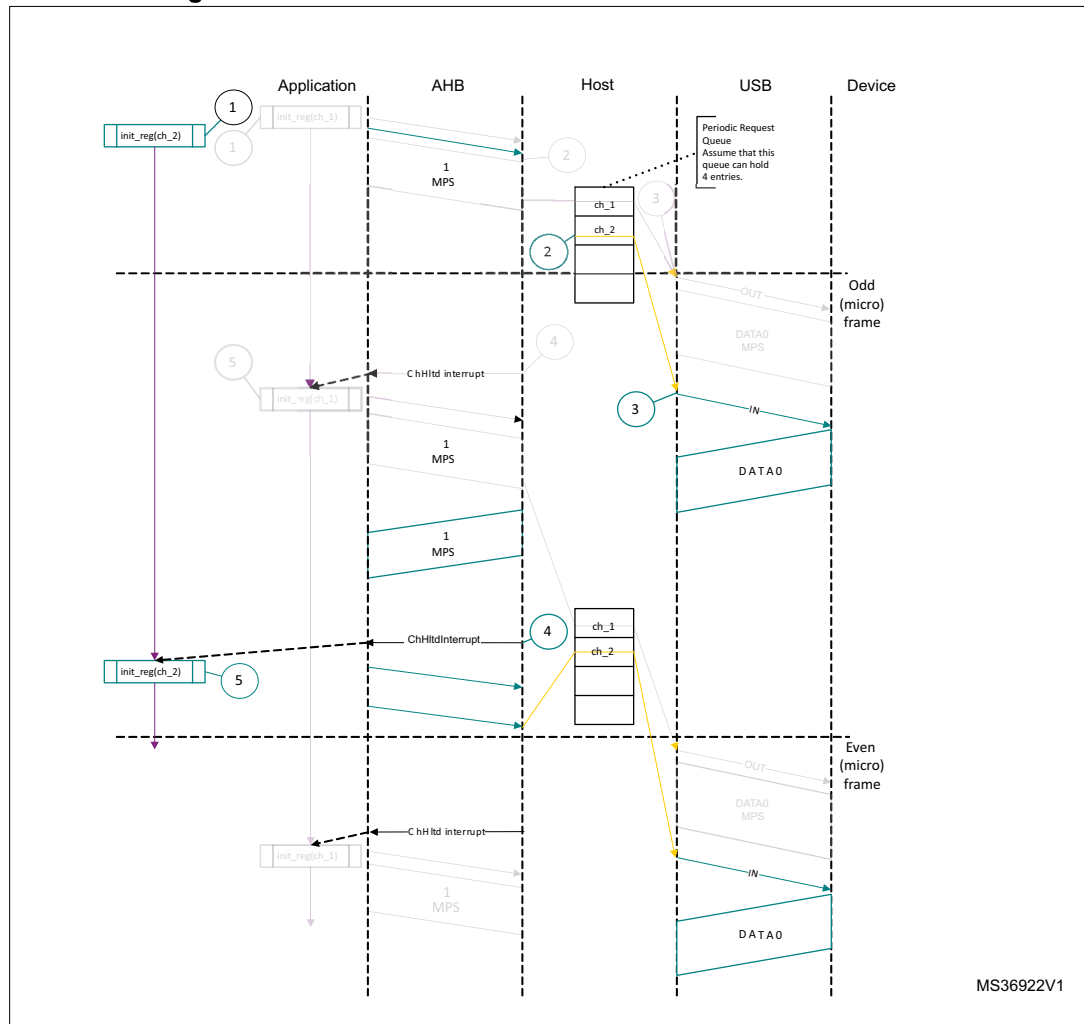

• **Isochronous IN transactions in DMA mode**

The sequence of operations ((channel x) is as follows:

1. Initialize and enable channel x as explained in [Section : Channel initialization](#).
2. The OTG\_HS host writes an IN request to the request queue as soon as the channel x gets the grant from the arbiter (round-robin with fairness). In high-bandwidth transfers, the OTG\_HS host performs consecutive write operations up to MC times.

3. The OTG\_HS host attempts to send an IN token at the beginning of the next (odd) frame/micro-frame.
4. As soon the packet is received and written to the receive FIFO, the OTG\_HS host generates a CHH interrupt.
5. In response to the CHH interrupt, reinitialize the channel for the next transfer.

**Figure 741. Normal isochronous IN transactions - DMA mode**

• **Bulk and control OUT/SETUP split transactions in DMA mode**

The sequence of operations in (channel x) is as follows:

1. Initialize and enable channel x for start split as explained in [Section : Channel initialization](#).
2. The OTG\_HS host starts fetching the first packet as soon the channel is enabled and writes the OUT request along with the last 32-bit word fetch.
3. After successfully transmitting start split, the OTG\_HS host generates the CHH interrupt.
4. In response to the CHH interrupt, set the COMPLSPLT bit in OTG\_HCSPLT1 to send the complete split.

5. After successfully transmitting complete split, the OTG\_HS host generates the CHH interrupt.
6. In response to the CHH interrupt, de-allocate the channel.
  - **Bulk/control IN split transactions in DMA mode**

The sequence of operations (channel x) is as follows:

    1. Initialize and enable channel x as explained in [Section : Channel initialization](#).
    2. The OTG\_HS host writes the start split request to the nonperiodic request after getting the grant from the arbiter. The OTG\_HS host masks the channel x internally for the arbitration after writing the request.
    3. As soon as the IN token is transmitted, the OTG\_HS host generates the CHH interrupt.
    4. In response to the CHH interrupt, set the COMPLSPLT bit in OTG\_HCSPLT2 and re-enable the channel to send the complete split token. This unmask channel x for arbitration.
    5. The OTG\_HS host writes the complete split request to the nonperiodic request after receiving the grant from the arbiter.
    6. The OTG\_HS host starts writing the packet to the system memory after receiving the packet successfully.
    7. As soon as the received packet is written to the system memory, the OTG\_HS host generates a CHH interrupt.
    8. In response to the CHH interrupt, de-allocate the channel.
  - **Interrupt OUT split transactions in DMA mode**

The sequence of operations in (channel x) is as follows:

    1. Initialize and enable channel 1 for start split as explained in [Section : Channel initialization](#). The application must set the ODDFRM bit in OTG\_HCCHAR1.
    2. The OTG\_HS host starts reading the packet.
    3. The OTG\_HS host attempts to send the start split transaction.
    4. After successfully transmitting the start split, the OTG\_HS host generates the CHH interrupt.
    5. In response to the CHH interrupt, set the COMPLSPLT bit in OTG\_HCSPLT1 to send the complete split.
    6. After successfully completing the complete split transaction, the OTG\_HS host generates the CHH interrupt.
    7. In response to CHH interrupt, de-allocate the channel.
  - **Interrupt IN split transactions in DMA mode**

The sequence of operations in (channel x) is as follows:

    1. Initialize and enable channel x for start split as explained in [Section : Channel initialization](#).
    2. The OTG\_HS host writes an IN request to the request queue as soon as channel x receives the grant from the arbiter.
    3. The OTG\_HS host attempts to send the start split IN token at the beginning of the next odd micro-frame.
    4. The OTG\_HS host generates the CHH interrupt after successfully transmitting the start split IN token.
    5. In response to the CHH interrupt, set the COMPLSPLT bit in OTG\_HCSPLT2 to send the complete split.

6. As soon as the packet is received successfully, the OTG\_HS host starts writing the data to the system memory.
7. The OTG\_HS host generates the CHH interrupt after transferring the received data to the system memory.
8. In response to the CHH interrupt, de-allocate or reinitialize the channel for the next start split.

- **Isochronous OUT split transactions in DMA mode**

The sequence of operations (channel x) is as follows:

1. Initialize and enable channel x for start split (begin) as explained in [Section : Channel initialization](#). The application must set the ODDFRM bit in OTG\_HCCHAR1. Program the MPS field.
2. The OTG\_HS host starts reading the packet.
3. After successfully transmitting the start split (begin), the OTG\_HS host generates the CHH interrupt.
4. In response to the CHH interrupt, reinitialize the registers to send the start split (end).
5. After successfully transmitting the start split (end), the OTG\_HS host generates a CHH interrupt.
6. In response to the CHH interrupt, de-allocate the channel.

- **Isochronous IN split transactions in DMA mode**

The sequence of operations (channel x) is as follows:

1. Initialize and enable channel x for start split as explained in [Section : Channel initialization](#).
2. The OTG\_HS host writes an IN request to the request queue as soon as channel x receives the grant from the arbiter.
3. The OTG\_HS host attempts to send the start split IN token at the beginning of the next odd micro-frame.
4. The OTG\_HS host generates the CHH interrupt after successfully transmitting the start split IN token.
5. In response to the CHH interrupt, set the COMPLSPLT bit in OTG\_HCSPLT2 to send the complete split.
6. As soon as the packet is received successfully, the OTG\_HS host starts writing the data to the system memory.

The OTG\_HS host generates the CHH interrupt after transferring the received data to the system memory. In response to the CHH interrupt, de-allocate the channel or reinitialize the channel for the next start split.

## 62.15.6 Device programming model

### Endpoint initialization on USB reset

1. Set the NAK bit for all OUT endpoints
  - SNAK = 1 in OTG\_DOEPCTLx (for all OUT endpoints)
2. Unmask the following interrupt bits
  - INEP0 = 1 in OTG\_DAINMSK (control 0 IN endpoint)
  - OUTEP0 = 1 in OTG\_DAINMSK (control 0 OUT endpoint)
  - STUPM = 1 in OTG\_DOEPMSK
  - XFRCM = 1 in OTG\_DOEPMSK
  - XFRCM = 1 in OTG\_DIEPMSK
  - TOM = 1 in OTG\_DIEPMSK
3. Set up the data FIFO RAM for each of the FIFOs
  - Program the OTG\_GRXFSIZ register, to be able to receive control OUT data and setup data. If thresholding is not enabled, at a minimum, this must be equal to 1 max packet size of control endpoint 0 + 2 words (for the status of the control OUT data packet) + 10 words (for setup packets).
  - Program the OTG\_DIEPTXF0 register (depending on the FIFO number chosen) to be able to transmit control IN data. At a minimum, this must be equal to 1 max packet size of control endpoint 0.
4. Program the following fields in the endpoint-specific registers for control OUT endpoint 0 to receive a SETUP packet
  - STUPCNT = 3 in OTG\_DOEPTSIZ0 (to receive up to 3 back-to-back SETUP packets)
5. For USB OTG\_HS in DMA mode, the OTG\_DOEPDMA0 register should have a valid memory address to store any SETUP packets received.

At this point, all initialization required to receive SETUP packets is done.

### Endpoint initialization on enumeration completion

1. On the Enumeration Done interrupt (ENUMDNE in OTG\_GINTSTS), read the OTG\_DSTS register to determine the enumeration speed.
2. Program the MPSIZ field in OTG\_DIEPCTL0 to set the maximum packet size. This step configures control endpoint 0. The maximum packet size for a control endpoint depends on the enumeration speed.
3. For USB OTG\_HS in DMA mode, program the OTG\_DOEPCTL0 register to enable control OUT endpoint 0, to receive a SETUP packet.

At this point, the device is ready to receive SOF packets and is configured to perform control transfers on control endpoint 0.

### Endpoint initialization on SetAddress command

This section describes what the application must do when it receives a SetAddress command in a SETUP packet.

1. Program the OTG\_DCFG register with the device address received in the SetAddress command
2. Program the core to send out a status IN packet

### Endpoint initialization on SetConfiguration/SetInterface command

This section describes what the application must do when it receives a SetConfiguration or SetInterface command in a SETUP packet.

1. When a SetConfiguration command is received, the application must program the endpoint registers to configure them with the characteristics of the valid endpoints in the new configuration.
2. When a SetInterface command is received, the application must program the endpoint registers of the endpoints affected by this command.
3. Some endpoints that were active in the prior configuration or alternate setting are not valid in the new configuration or alternate setting. These invalid endpoints must be deactivated.
4. Unmask the interrupt for each active endpoint and mask the interrupts for all inactive endpoints in the OTG\_DAINMSK register.
5. Set up the data FIFO RAM for each FIFO.
6. After all required endpoints are configured; the application must program the core to send a status IN packet.

At this point, the device core is configured to receive and transmit any type of data packet.

### Endpoint activation

This section describes the steps required to activate a device endpoint or to configure an existing device endpoint to a new type.

1. Program the characteristics of the required endpoint into the following fields of the OTG\_DIEPCTLx register (for IN or bidirectional endpoints) or the OTG\_DOEPCTLx register (for OUT or bidirectional endpoints).
  - Maximum packet size
  - USB active endpoint = 1
  - Endpoint start data toggle (for interrupt and bulk endpoints)
  - Endpoint type
  - Tx FIFO number
2. Once the endpoint is activated, the core starts decoding the tokens addressed to that endpoint and sends out a valid handshake for each valid token received for the endpoint.

### Endpoint deactivation

This section describes the steps required to deactivate an existing endpoint.

1. In the endpoint to be deactivated, clear the USB active endpoint bit in the OTG\_DIEPCTLx register (for IN or bidirectional endpoints) or the OTG\_DOEPCTLx register (for OUT or bidirectional endpoints).
2. Once the endpoint is deactivated, the core ignores tokens addressed to that endpoint, which results in a timeout on the USB.

*Note:* The application must meet the following conditions to set up the device core to handle traffic:

*NPTXFEM and RXFLVLM in the OTG\_GINTMSK register must be cleared.*

## Operational model

SETUP and OUT data transfers:

This section describes the internal data flow and application-level operations during data OUT transfers and SETUP transactions.

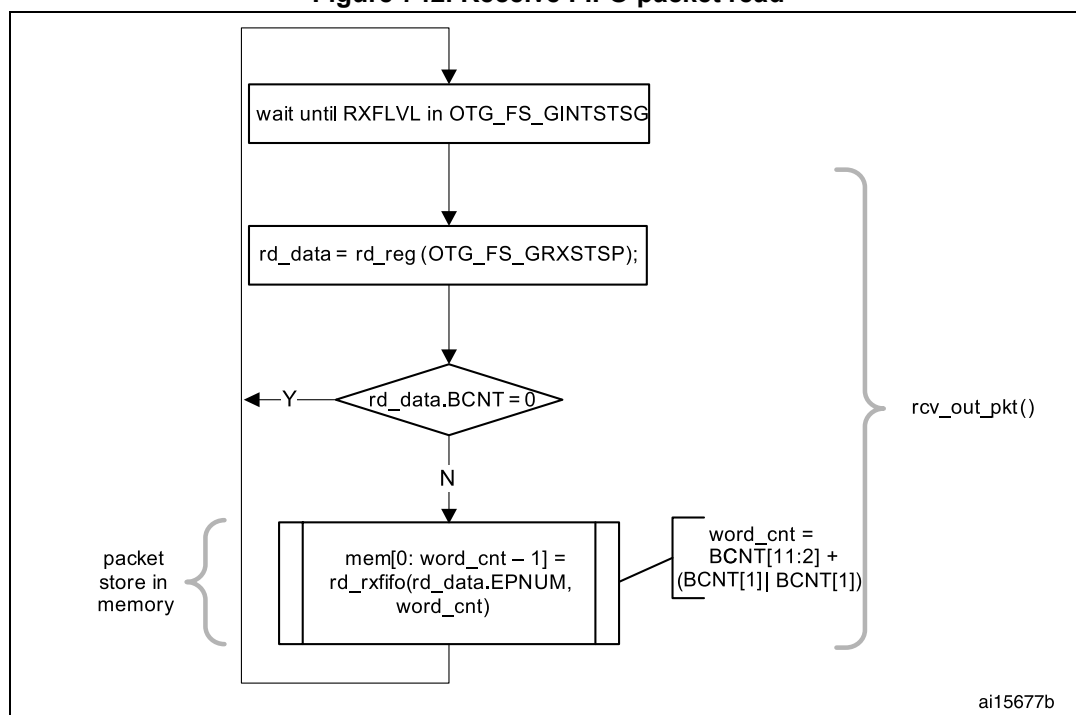

- **Packet read**

This section describes how to read packets (OUT data and SETUP packets) from the receive FIFO.

1. On catching an RXFLVL interrupt (OTG\_GINTSTS register), the application must read the receive status pop register (OTG\_GRXSTSP).
2. The application can mask the RXFLVL interrupt (in OTG\_GINTSTS) by writing to RXFLVLM = 0 (in OTG\_GINTMSK), until it has read the packet from the receive FIFO.
3. If the received packet's byte count is not 0, the byte count amount of data is popped from the receive data FIFO and stored in memory. If the received packet byte count is 0, no data is popped from the receive data FIFO.
4. The receive status readout of the packet of FIFO indicates one of the following:
  - a) Global OUT NAK pattern:  
PKTSTS = Global OUT NAK, BCNT = 0x000, EPNUM = (0x0), DPID = (0b00).  
These data indicate that the global OUT NAK bit has taken effect.
  - b) SETUP packet pattern:  
PKTSTS = SETUP, BCNT = 0x008, EPNUM = Control EP Num, DPID = DATA0. These data indicate that a SETUP packet for the specified endpoint is now available for reading from the receive FIFO.
  - c) Setup stage done pattern:  
PKTSTS = Setup Stage Done, BCNT = 0x0, EPNUM = Control EP Num, DPID = (0b00).  
These data indicate that the setup stage for the specified endpoint has completed and the data stage has started. After this entry is popped from the receive FIFO, the core asserts a setup interrupt on the specified control OUT endpoint.
  - d) Data OUT packet pattern:  
PKTSTS = DataOUT, BCNT = size of the received data OUT packet ( $0 \leq BCNT \leq 1024$ ), EPNUM = EPNUM on which the packet was received, DPID = Actual Data PID.
  - e) Data transfer completed pattern:  
PKTSTS = Data OUT transfer done, BCNT = 0x0, EPNUM = OUT EP Num on which the data transfer is complete, DPID = (0b00).  
These data indicate that an OUT data transfer for the specified OUT endpoint has completed. After this entry is popped from the receive FIFO, the core asserts a transfer completed interrupt on the specified OUT endpoint.
5. After the data payload is popped from the receive FIFO, the RXFLVL interrupt (OTG\_GINTSTS) must be unmasked.
6. Steps 1–5 are repeated every time the application detects assertion of the interrupt line due to RXFLVL in OTG\_GINTSTS. Reading an empty receive FIFO can result in undefined core behavior.

*Figure 742* provides a flowchart of the above procedure.

Figure 742. Receive FIFO packet read

**SETUP transactions**

This section describes how the core handles SETUP packets and the application’s sequence for handling SETUP transactions.

• **Application requirements**

1. To receive a SETUP packet, the STUPCNT field (OTG\_DOEPTSIZE<sub>x</sub>) in a control OUT endpoint must be programmed to a non-zero value. When the application programs the STUPCNT field to a non-zero value, the core receives SETUP packets and writes them to the receive FIFO, irrespective of the NAK status and EPENA bit setting in OTG\_DOEPTCTL<sub>x</sub>. The STUPCNT field is decremented every time the control endpoint receives a SETUP packet. If the STUPCNT field is not programmed to a proper value before receiving a SETUP packet, the core still receives the SETUP packet and decrements the STUPCNT field, but the application may not be able to determine the correct number of SETUP packets received in the setup stage of a control transfer.
  - STUPCNT = 3 in OTG\_DOEPTSIZE<sub>x</sub>
2. The application must always allocate some extra space in the receive data FIFO, to be able to receive up to three SETUP packets on a control endpoint.
  - The space to be reserved is 10 words. Three words are required for the first SETUP packet, 1 word is required for the setup stage done word and 6 words are required to store two extra SETUP packets among all control endpoints.
  - 3 words per SETUP packet are required to store 8 bytes of SETUP data and 4 bytes of SETUP status (setup packet pattern). The core reserves this space in the

receive data FIFO to write SETUP data only, and never uses this space for data packets.

3. The application must read the 2 words of the SETUP packet from the receive FIFO.
4. The application must read and discard the setup stage done word from the receive FIFO.

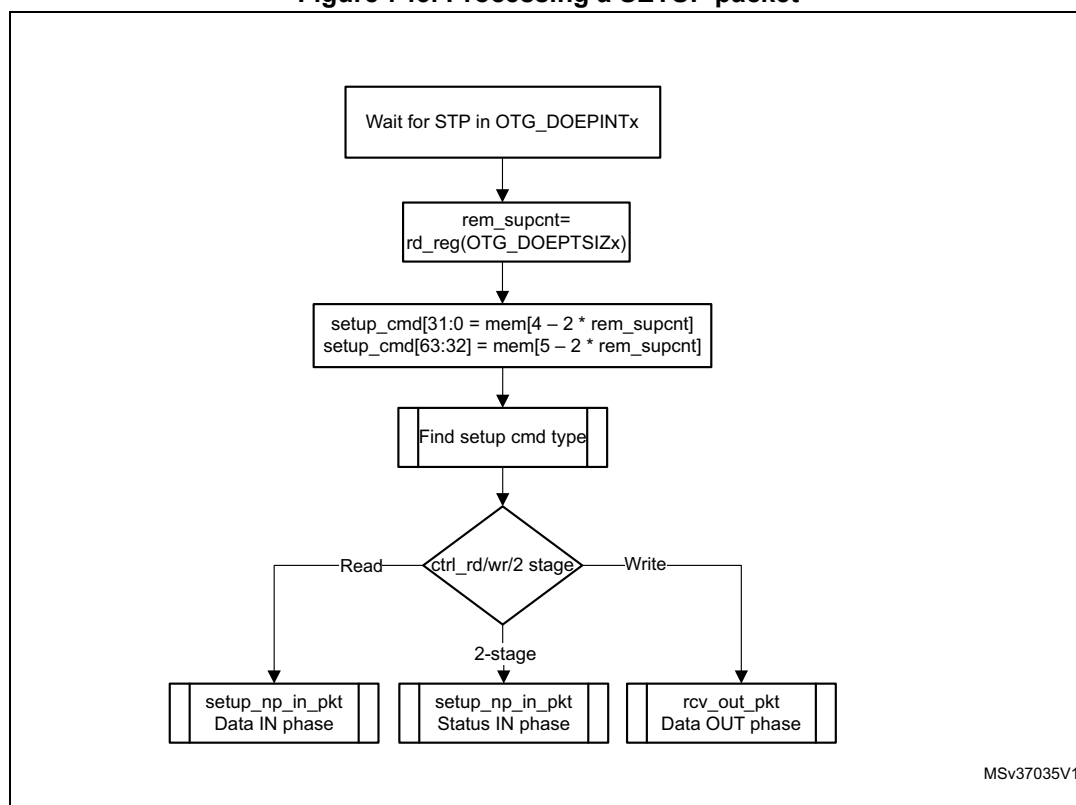

- **Internal data flow**

1. When a SETUP packet is received, the core writes the received data to the receive FIFO, without checking for available space in the receive FIFO and irrespective of the endpoint's NAK and STALL bit settings.
  - The core internally sets the IN NAK and OUT NAK bits for the control IN/OUT endpoints on which the SETUP packet was received.
2. For every SETUP packet received on the USB, 3 words of data are written to the receive FIFO, and the STUPCNT field is decremented by 1.
  - The first word contains control information used internally by the core
  - The second word contains the first 4 bytes of the SETUP command
  - The third word contains the last 4 bytes of the SETUP command
3. When the setup stage changes to a data IN/OUT stage, the core writes an entry (setup stage done word) to the receive FIFO, indicating the completion of the setup stage.
4. On the AHB side, SETUP packets are emptied by the application.
5. When the application pops the setup stage done word from the receive FIFO, the core interrupts the application with an STUP interrupt (OTG\_DOEPINTx), indicating it can process the received SETUP packet.
6. The core clears the endpoint enable bit for control OUT endpoints.

- **Application programming sequence**

1. Program the OTG\_DOEPTSIZE register.
  - STUPCNT = 3
2. Wait for the RXFLVL interrupt (OTG\_GINTSTS) and empty the data packets from the receive FIFO.
3. Assertion of the STUP interrupt (OTG\_DOEPINTx) marks a successful completion of the SETUP data transfer.
  - On this interrupt, the application must read the OTG\_DOEPTSIZE register to determine the number of SETUP packets received and process the last received SETUP packet.

Figure 743. Processing a SETUP packet

• **Handling more than three back-to-back SETUP packets**

Per the USB 2.0 specification, normally, during a SETUP packet error, a host does not send more than three back-to-back SETUP packets to the same endpoint. However, the USB 2.0 specification does not limit the number of back-to-back SETUP packets a host can send to the same endpoint. When this condition occurs, the OTG\_HS controller generates an interrupt (B2BSTUP in OTG\_DOEPINTx).

• **Setting the global OUT NAK**

Internal data flow:

1. When the application sets the Global OUT NAK (SGONAK bit in OTG\_DCTL), the core stops writing data, except SETUP packets, to the receive FIFO. Irrespective of the space availability in the receive FIFO, non-isochronous OUT tokens receive a NAK handshake response, and the core ignores isochronous OUT data packets
2. The core writes the Global OUT NAK pattern to the receive FIFO. The application must reserve enough receive FIFO space to write this data pattern.
3. When the application pops the Global OUT NAK pattern word from the receive FIFO, the core sets the GONAKEFF interrupt (OTG\_GINTSTS).
4. Once the application detects this interrupt, it can assume that the core is in Global OUT NAK mode. The application can clear this interrupt by clearing the SGONAK bit in OTG\_DCTL.

Application programming sequence:

1. To stop receiving any kind of data in the receive FIFO, the application must set the Global OUT NAK bit by programming the following field:
  - SGONAK = 1 in OTG\_DCTL
2. Wait for the assertion of the GONAKEFF interrupt in OTG\_GINTSTS. When asserted, this interrupt indicates that the core has stopped receiving any type of data except SETUP packets.
3. The application can receive valid OUT packets after it has set SGONAK in OTG\_DCTL and before the core asserts the GONAKEFF interrupt (OTG\_GINTSTS).
4. The application can temporarily mask this interrupt by writing to the GONAKEFFM bit in the OTG\_GINTMSK register.
  - GONAKEFFM = 0 in the OTG\_GINTMSK register
5. Whenever the application is ready to exit the Global OUT NAK mode, it must clear the SGONAK bit in OTG\_DCTL. This also clears the GONAKEFF interrupt (OTG\_GINTSTS).
  - CGONAK = 1 in OTG\_DCTL
6. If the application has masked this interrupt earlier, it must be unmasked as follows:
  - GONAKEFFM = 1 in OTG\_GINTMSK

- **Disabling an OUT endpoint**

The application must use this sequence to disable an OUT endpoint that it has enabled.

Application programming sequence:

1. Before disabling any OUT endpoint, the application must enable Global OUT NAK mode in the core.
  - SGONAK = 1 in OTG\_DCTL
2. Wait for the GONAKEFF interrupt (OTG\_GINTSTS)
3. Disable the required OUT endpoint by programming the following fields:
  - EPDIS = 1 in OTG\_DOEPCTLx
  - SNAK = 1 in OTG\_DOEPCTLx
4. Wait for the EPDISD interrupt (OTG\_DOEPINTx), which indicates that the OUT endpoint is completely disabled. When the EPDISD interrupt is asserted, the core also clears the following bits:
  - EPDIS = 0 in OTG\_DOEPCTLx
  - EPENA = 0 in OTG\_DOEPCTLx
5. The application must clear the Global OUT NAK bit to start receiving data from other non-disabled OUT endpoints.
  - SGONAK = 0 in OTG\_DCTL

- **Transfer Stop Programming for OUT endpoints**

The application must use the following programming sequence to stop any transfers (because of an interrupt from the host, typically a reset).

**Sequence of operations:**

1. Enable all OUT endpoints by setting
  - EPENA = 1 in all OTG\_DOEPCTLx registers.
2. Flush the RxFIFO as follows
  - Poll OTG\_GRSTCTL.AHBIDL until it is 1. This indicates that AHB master is idle.
  - Perform read modify write operation on OTG\_GRSTCTL.RXFFLSH = 1
  - Poll OTG\_GRSTCTL.RXFFLSH until it is 0, but also using a timeout of less than 10 milli-seconds (corresponds to minimum reset signaling duration). If 0 is seen before the timeout, then the RxFIFO flush is successful. If at the moment the timeout occurs, there is still a 1, (this may be due to a packet on EP0 coming from the host) then go back (once only) to the previous step (“Perform read modify write operation”).
3. Before disabling any OUT endpoint, the application must enable Global OUT NAK mode in the core, according to the instructions in [“Setting the global OUT NAK on page 2685”](#). This ensures that data in the RxFIFO is sent to the application successfully. Set SGONAK = 1 in OTG\_DCTL
4. Wait for the GONAKEFF interrupt (OTG\_GINTSTS)
5. Disable all active OUT endpoints by programming the following register bits:
  - EPDIS = 1 in registers OTG\_DOEPCTLx
  - SNAK = 1 in registers OTG\_DOEPCTLx
6. Wait for the EPDIS interrupt in OTG\_DOEPINTx for each OUT endpoint programmed in the previous step. The EPDIS interrupt in OTG\_DOEPINTx indicates that the corresponding OUT endpoint is completely disabled. When the EPDIS interrupt is asserted, the following bits are cleared:
  - EPENA = 0 in registers OTG\_DOEPCTLx
  - EPDIS = 0 in registers OTG\_DOEPCTLx
  - SNAK = 0 in registers OTG\_DOEPCTLx

- **Generic non-isochronous OUT data transfers**

This section describes a regular non-isochronous OUT data transfer (control, bulk, or interrupt).

Application requirements:

1. Before setting up an OUT transfer, the application must allocate a buffer in the memory to accommodate all data to be received as part of the OUT transfer.
2. For OUT transfers, the transfer size field in the endpoint’s transfer size register must be a multiple of the maximum packet size of the endpoint, adjusted to the word boundary.
  - $\text{transfer size}[\text{EPNUM}] = n \times (\text{MPSIZ}[\text{EPNUM}] + 4 - (\text{MPSIZ}[\text{EPNUM}] \bmod 4))$
  - $\text{packet count}[\text{EPNUM}] = n$
  - $n > 0$
3. On any OUT endpoint interrupt, the application must read the endpoint’s transfer size register to calculate the size of the payload in the memory. The received payload size can be less than the programmed transfer size.
  - $\text{Payload size in memory} = \text{application programmed initial transfer size} - \text{core updated final transfer size}$
  - $\text{Number of USB packets in which this payload was received} = \text{application programmed initial packet count} - \text{core updated final packet count}$

Internal data flow:

1. The application must set the transfer size and packet count fields in the endpoint-specific registers, clear the NAK bit, and enable the endpoint to receive the data.
2. Once the NAK bit is cleared, the core starts receiving data and writes it to the receive FIFO, as long as there is space in the receive FIFO. For every data packet received on the USB, the data packet and its status are written to the receive FIFO. Every packet (maximum packet size or short packet) written to the receive FIFO decrements the packet count field for that endpoint by 1.
  - OUT data packets received with bad data CRC are flushed from the receive FIFO automatically.
  - After sending an ACK for the packet on the USB, the core discards non-isochronous OUT data packets that the host, which cannot detect the ACK, re-sends. The application does not detect multiple back-to-back data OUT packets on the same endpoint with the same data PID. In this case the packet count is not decremented.
  - If there is no space in the receive FIFO, isochronous or non-isochronous data packets are ignored and not written to the receive FIFO. Additionally, non-isochronous OUT tokens receive a NAK handshake reply.
  - In all the above three cases, the packet count is not decremented because no data are written to the receive FIFO.
3. When the packet count becomes 0 or when a short packet is received on the endpoint, the NAK bit for that endpoint is set. Once the NAK bit is set, the isochronous or non-isochronous data packets are ignored and not written to the receive FIFO, and non-isochronous OUT tokens receive a NAK handshake reply.
4. After the data are written to the receive FIFO, the application reads the data from the receive FIFO and writes it to external memory, one packet at a time per endpoint.
5. At the end of every packet write on the AHB to external memory, the transfer size for the endpoint is decremented by the size of the written packet.
6. The OUT data transfer completed pattern for an OUT endpoint is written to the receive FIFO on one of the following conditions:
  - The transfer size is 0 and the packet count is 0
  - The last OUT data packet written to the receive FIFO is a short packet ( $0 \leq \text{packet size} < \text{maximum packet size}$ )
7. When either the application pops this entry (OUT data transfer completed), a transfer completed interrupt is generated for the endpoint and the endpoint enable is cleared.

Application programming sequence:

1. Program the OTG\_DOEPTSIZE register for the transfer size and the corresponding packet count.
2. Program the OTG\_DOEPCTL register with the endpoint characteristics, and set the EPENA and CNAK bits.
  - EPENA = 1 in OTG\_DOEPCTL
  - CNAK = 1 in OTG\_DOEPCTL
3. Wait for the RXFLVL interrupt (in OTG\_GINTSTS) and empty the data packets from the receive FIFO.
  - This step can be repeated many times, depending on the transfer size.
4. Asserting the XFRC interrupt (OTG\_DOEPINT) marks a successful completion of the non-isochronous OUT data transfer.
5. Read the OTG\_DOEPTSIZE register to determine the size of the received data payload.

- **Generic isochronous OUT data transfer**

This section describes a regular isochronous OUT data transfer.

Application requirements:

1. All the application requirements for non-isochronous OUT data transfers also apply to isochronous OUT data transfers.
2. For isochronous OUT data transfers, the transfer size and packet count fields must always be set to the number of maximum-packet-size packets that can be received in a single frame and no more. Isochronous OUT data transfers cannot span more than 1 frame.
3. The application must read all isochronous OUT data packets from the receive FIFO (data and status) before the end of the periodic frame (EOPF interrupt in OTG\_GINTSTS).
4. To receive data in the following frame, an isochronous OUT endpoint must be enabled after the EOPF (OTG\_GINTSTS) and before the SOF (OTG\_GINTSTS).

Internal data flow:

1. The internal data flow for isochronous OUT endpoints is the same as that for non-isochronous OUT endpoints, but for a few differences.
2. When an isochronous OUT endpoint is enabled by setting the endpoint enable and clearing the NAK bits, the Even/Odd frame bit must also be set appropriately. The core receives data on an isochronous OUT endpoint in a particular frame only if the following condition is met:
  - EONUM (in OTG\_DOEPCTL) = FNSOF[0] (in OTG\_DSTS)
3. When the application completely reads an isochronous OUT data packet (data and status) from the receive FIFO, the core updates the RXDPID field in OTG\_DOEPTSIZE with the data PID of the last isochronous OUT data packet read from the receive FIFO.

Application programming sequence:

1. Program the OTG\_DOEPTSIZE register for the transfer size and the corresponding packet count
2. Program the OTG\_DOEPCTL register with the endpoint characteristics and set the endpoint enable, ClearNAK, and Even/Odd frame bits.
  - EPENA = 1
  - CNAK = 1
  - EONUM = (0: Even/1: Odd)
3. Wait for the RXFLVL interrupt (in OTG\_GINTSTS) and empty the data packets from the receive FIFO
  - This step can be repeated many times, depending on the transfer size.
4. The assertion of the XFRC interrupt (in OTG\_DOEPINT) marks the completion of the isochronous OUT data transfer. This interrupt does not necessarily mean that the data in memory are good.
5. This interrupt cannot always be detected for isochronous OUT transfers. Instead, the application can detect the INCOMPISOOUT interrupt in OTG\_GINTSTS.
6. Read the OTG\_DOEPTSIZE register to determine the size of the received transfer and to determine the validity of the data received in the frame. The application must treat the data received in memory as valid only if one of the following conditions is met:
  - RXDPID = DATA0 (in OTG\_DOEPTSIZE) and the number of USB packets in which this payload was received = 1
  - RXDPID = DATA1 (in OTG\_DOEPTSIZE) and the number of USB packets in which this payload was received = 2
  - RXDPID = D2 (in OTG\_DOEPTSIZE) and the number of USB packets in which this payload was received = 3

The number of USB packets in which this payload was received =  
 Application programmed initial packet count – core updated final packet count

The application can discard invalid data packets.

- **Incomplete isochronous OUT data transfers**

This section describes the application programming sequence when isochronous OUT data packets are dropped inside the core.

Internal data flow:

1. For isochronous OUT endpoints, the XFRC interrupt (in OTG\_DOEPINT) may not always be asserted. If the core drops isochronous OUT data packets, the application could fail to detect the XFRC interrupt (OTG\_DOEPINT) under the following circumstances:
  - When the receive FIFO cannot accommodate the complete ISO OUT data packet, the core drops the received ISO OUT data
  - When the isochronous OUT data packet is received with CRC errors
  - When the isochronous OUT token received by the core is corrupted
  - When the application is very slow in reading the data from the receive FIFO
2. When the core detects an end of periodic frame before transfer completion to all isochronous OUT endpoints, it asserts the incomplete isochronous OUT data interrupt (INCOMPISOOUT in OTG\_GINTSTS), indicating that an XFRC interrupt (in OTG\_DOEPINT) is not asserted on at least one of the isochronous OUT endpoints. At

this point, the endpoint with the incomplete transfer remains enabled, but no active transfers remain in progress on this endpoint on the USB.

Application programming sequence:

1. Asserting the INCOMPISOOUT interrupt (OTG\_GINTSTS) indicates that in the current frame, at least one isochronous OUT endpoint has an incomplete transfer.
2. If this occurs because isochronous OUT data is not completely emptied from the endpoint, the application must ensure that the application empties all isochronous OUT data (data and status) from the receive FIFO before proceeding.
  - When all data are emptied from the receive FIFO, the application can detect the XFRC interrupt (OTG\_DOEPINTx). In this case, the application must re-enable the endpoint to receive isochronous OUT data in the next frame.
3. When it receives an INCOMPISOOUT interrupt (in OTG\_GINTSTS), the application must read the control registers of all isochronous OUT endpoints (OTG\_DOEPCTLx) to determine which endpoints had an incomplete transfer in the current microframe. An endpoint transfer is incomplete if both the following conditions are met:
  - EONUM bit (in OTG\_DOEPCTLx) = FNSOF[0] (in OTG\_DSTS)
  - EPENA = 1 (in OTG\_DOEPCTLx)
4. The previous step must be performed before the SOF interrupt (in OTG\_GINTSTS) is detected, to ensure that the current frame number is not changed.
5. For isochronous OUT endpoints with incomplete transfers, the application must discard the data in the memory and disable the endpoint by setting the EPDIS bit in OTG\_DOEPCTLx.
6. Wait for the EPDISD interrupt (in OTG\_DOEPINTx) and enable the endpoint to receive new data in the next frame.
  - Because the core can take some time to disable the endpoint, the application may not be able to receive the data in the next frame after receiving bad isochronous data.

- **Stalling a non-isochronous OUT endpoint**

This section describes how the application can stall a non-isochronous endpoint.

1. Put the core in the Global OUT NAK mode.
2. Disable the required endpoint
  - When disabling the endpoint, instead of setting the SNAK bit in OTG\_DOEPCTL, set STALL = 1 (in OTG\_DOEPCTL).

The STALL bit always takes precedence over the NAK bit.
3. When the application is ready to end the STALL handshake for the endpoint, the STALL bit (in OTG\_DOEPCTLx) must be cleared.
4. If the application is setting or clearing a STALL for an endpoint due to a SetFeature.Endpoint Halt or ClearFeature.Endpoint Halt command, the STALL bit must be set or cleared before the application sets up the status stage transfer on the control endpoint.

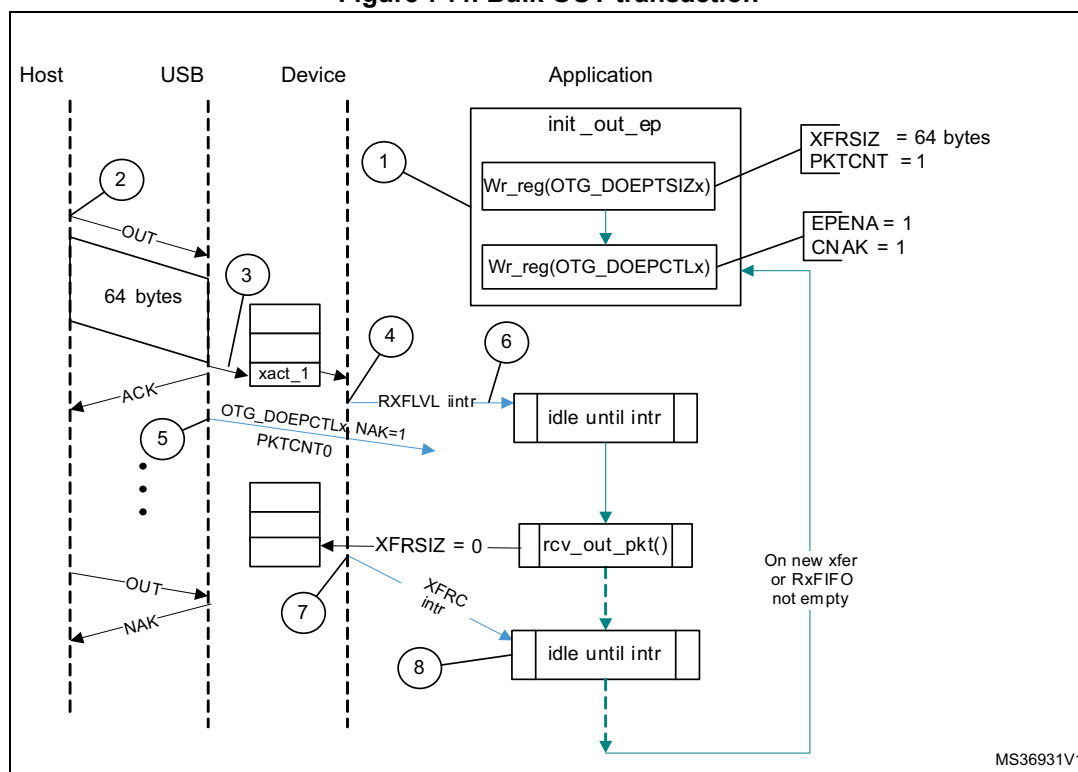

## Examples

This section describes and depicts some fundamental transfer types and scenarios.

- Bulk OUT transaction

Figure 744 depicts the reception of a single Bulk OUT data packet from the USB to the AHB and describes the events involved in the process.

Figure 744. Bulk OUT transaction

After a SetConfiguration/SetInterface command, the application initializes all OUT endpoints by setting CNAK = 1 and EPENA = 1 (in OTG\_DOEPTSLx), and setting a suitable XFRSIZ and PKTCNT in the OTG\_DOEPTSIZx register.

1. host attempts to send data (OUT token) to an endpoint.
2. When the core receives the OUT token on the USB, it stores the packet in the Rx FIFO because space is available there.
3. After writing the complete packet in the Rx FIFO, the core then asserts the RXFLVL interrupt (in OTG\_GINTSTS).
4. On receiving the PKTCNT number of USB packets, the core internally sets the NAK bit for this endpoint to prevent it from receiving any more packets.
5. The application processes the interrupt and reads the data from the Rx FIFO.
6. When the application has read all the data (equivalent to XFRSIZ), the core generates an XFRM interrupt (in OTG\_DOEPINTx).
7. The application processes the interrupt and uses the setting of the XFRM interrupt bit (in OTG\_DOEPINTx) to determine that the intended transfer is complete.

### IN data transfers

- **Packet write**

This section describes how the application writes data packets to the endpoint FIFO when dedicated transmit FIFOs are enabled.

1. The application can either choose the polling or the interrupt mode.
  - In polling mode, the application monitors the status of the endpoint transmit data FIFO by reading the OTG\_DTXFSTSx register, to determine if there is enough space in the data FIFO.
  - In interrupt mode, the application waits for the TXFE interrupt (in OTG\_DIEPINTx) and then reads the OTG\_DTXFSTSx register, to determine if there is enough space in the data FIFO.
  - To write a single non-zero length data packet, there must be space to write the entire packet in the data FIFO.
  - To write zero length packet, the application must not look at the FIFO space.
2. Using one of the above mentioned methods, when the application determines that there is enough space to write a transmit packet, the application must first write into the endpoint control register, before writing the data into the data FIFO. Typically, the application, must do a read modify write on the OTG\_DIEPCTLx register to avoid modifying the contents of the register, except for setting the endpoint enable bit.

The application can write multiple packets for the same endpoint into the transmit FIFO, if space is available. For periodic IN endpoints, the application must write packets only for one microframe. It can write packets for the next periodic transaction only after getting transfer complete for the previous transaction.

- **Setting IN endpoint NAK**

Internal data flow:

1. When the application sets the IN NAK for a particular endpoint, the core stops transmitting data on the endpoint, irrespective of data availability in the endpoint's transmit FIFO.
2. Non-isochronous IN tokens receive a NAK handshake reply
  - Isochronous IN tokens receive a zero-data-length packet reply
3. The core asserts the INEPNE (IN endpoint NAK effective) interrupt in OTG\_DIEPINTx in response to the SNAK bit in OTG\_DIEPCTLx.
4. Once this interrupt is seen by the application, the application can assume that the endpoint is in IN NAK mode. This interrupt can be cleared by the application by setting the CNAK bit in OTG\_DIEPCTLx.

Application programming sequence:

1. To stop transmitting any data on a particular IN endpoint, the application must set the IN NAK bit. To set this bit, the following field must be programmed.
  - SNAK = 1 in OTG\_DIEPCTLx
2. Wait for assertion of the INEPNE interrupt in OTG\_DIEPINTx. This interrupt indicates that the core has stopped transmitting data on the endpoint.
3. The core can transmit valid IN data on the endpoint after the application has set the NAK bit, but before the assertion of the NAK Effective interrupt.
4. The application can mask this interrupt temporarily by writing to the INEPNEM bit in OTG\_DIEPMSK.
  - INEPNEM = 0 in OTG\_DIEPMSK
5. To exit endpoint NAK mode, the application must clear the NAK status bit (NAKSTS) in OTG\_DIEPCTLx. This also clears the INEPNE interrupt (in OTG\_DIEPINTx).

- CNAK = 1 in OTG\_DIEPCTLx
- 6. If the application masked this interrupt earlier, it must be unmasked as follows:
  - INEPNEM = 1 in OTG\_DIEPMSK

- **IN endpoint disable**

Use the following sequence to disable a specific IN endpoint that has been previously enabled.

Application programming sequence:

1. The application must stop writing data on the AHB for the IN endpoint to be disabled.
2. The application must set the endpoint in NAK mode.
  - SNAK = 1 in OTG\_DIEPCTLx
3. Wait for the INEPNE interrupt in OTG\_DIEPINTx.
4. Set the following bits in the OTG\_DIEPCTLx register for the endpoint that must be disabled.
  - EPDIS = 1 in OTG\_DIEPCTLx
  - SNAK = 1 in OTG\_DIEPCTLx
5. Assertion of the EPDISD interrupt in OTG\_DIEPINTx indicates that the core has completely disabled the specified endpoint. Along with the assertion of the interrupt, the core also clears the following bits:
  - EPENA = 0 in OTG\_DIEPCTLx
  - EPDIS = 0 in OTG\_DIEPCTLx
6. The application must read the OTG\_DIEPTSIZx register for the periodic IN EP, to calculate how much data on the endpoint were transmitted on the USB.
7. The application must flush the data in the endpoint transmit FIFO, by setting the following fields in the OTG\_GRSTCTL register:
  - TXFNUM (in OTG\_GRSTCTL) = Endpoint transmit FIFO number
  - TXFFLSH in (OTG\_GRSTCTL) = 1

The application must poll the OTG\_GRSTCTL register, until the TXFFLSH bit is cleared by the core, which indicates the end of flush operation. To transmit new data on this endpoint, the application can re-enable the endpoint at a later point.

- **Transfer Stop Programming for IN endpoints**

The application must use the following programming sequence to stop any transfers (because of an interrupt from the host, typically a reset).

**Sequence of operations:**

1. Disable the IN endpoint by setting:
  - EPDIS = 1 in all OTG\_DIEPCTLx registers
2. Wait for the EPDIS interrupt in OTG\_DIEPINTx, which indicates that the IN endpoint is completely disabled. When the EPDIS interrupt is asserted the following bits are cleared:
  - EPDIS = 0 in OTG\_DIEPCTLx
  - EPENA = 0 in OTG\_DIEPCTLx
3. Flush the TxFIFO by programming the following bits:
  - TXFFLSH = 1 in OTG\_GRSTCTL
  - TXFNUM = “FIFO number specific to endpoint” in OTG\_GRSTCTL
4. The application can start polling till TXFFLSH in OTG\_GRSTCTL is cleared. When this bit is cleared, it ensures that there is no data left in the Tx FIFO.

- **Generic non-periodic IN data transfers**

## Application requirements:

1. Before setting up an IN transfer, the application must ensure that all data to be transmitted as part of the IN transfer are part of a single buffer.
2. For IN transfers, the transfer size field in the endpoint transfer size register denotes a payload that constitutes multiple maximum-packet-size packets and a single short packet. This short packet is transmitted at the end of the transfer.
  - To transmit a few maximum-packet-size packets and a short packet at the end of the transfer:
 
$$\text{Transfer size}[\text{EPNUM}] = x \times \text{MPSIZ}[\text{EPNUM}] + \text{sp}$$
 If (sp > 0), then packet count[EPNUM] = x + 1.  
 Otherwise, packet count[EPNUM] = x
  - To transmit a single zero-length data packet:
 
$$\text{Transfer size}[\text{EPNUM}] = 0$$

$$\text{Packet count}[\text{EPNUM}] = 1$$
  - To transmit a few maximum-packet-size packets and a zero-length data packet at the end of the transfer, the application must split the transfer into two parts. The first sends maximum-packet-size data packets and the second sends the zero-length data packet alone.
 
$$\text{First transfer: transfer size}[\text{EPNUM}] = x \times \text{MPSIZ}[\text{epnum}]; \text{ packet count} = n;$$

$$\text{Second transfer: transfer size}[\text{EPNUM}] = 0; \text{ packet count} = 1;$$
3. Once an endpoint is enabled for data transfers, the core updates the transfer size register. At the end of the IN transfer, the application must read the transfer size register to determine how much data posted in the transmit FIFO have already been sent on the USB.
4. Data fetched into transmit FIFO = Application-programmed initial transfer size – core-updated final transfer size
  - Data transmitted on USB = (application-programmed initial packet count – core updated final packet count) × MPSIZ[EPNUM]
  - Data yet to be transmitted on USB = (Application-programmed initial transfer size – data transmitted on USB)

Internal data flow:

1. The application must set the transfer size and packet count fields in the endpoint-specific registers and enable the endpoint to transmit the data.
2. The application must also write the required data to the transmit FIFO for the endpoint.
3. Every time a packet is written into the transmit FIFO by the application, the transfer size for that endpoint is decremented by the packet size. The data is fetched from the memory by the application, until the transfer size for the endpoint becomes 0. After writing the data into the FIFO, the “number of packets in FIFO” count is incremented (this is a 3-bit count, internally maintained by the core for each IN endpoint transmit FIFO. The maximum number of packets maintained by the core at any time in an IN endpoint FIFO is eight). For zero-length packets, a separate flag is set for each FIFO, without any data in the FIFO.
4. Once the data are written to the transmit FIFO, the core reads them out upon receiving an IN token. For every non-isochronous IN data packet transmitted with an ACK handshake, the packet count for the endpoint is decremented by one, until the packet count is zero. The packet count is not decremented on a timeout.
5. For zero length packets (indicated by an internal zero length flag), the core sends out a zero-length packet for the IN token and decrements the packet count field.
6. If there are no data in the FIFO for a received IN token and the packet count field for that endpoint is zero, the core generates an “IN token received when Tx FIFO is empty” (ITTXFE) interrupt for the endpoint, provided that the endpoint NAK bit is not set. The core responds with a NAK handshake for non-isochronous endpoints on the USB.
7. The core internally rewinds the FIFO pointers and no timeout interrupt is generated.
8. When the transfer size is 0 and the packet count is 0, the transfer complete (XFRC) interrupt for the endpoint is generated and the endpoint enable is cleared.

Application programming sequence:

1. Program the OTG\_DIEPTSIZx register with the transfer size and corresponding packet count.
2. Program the OTG\_DIEPCTLx register with the endpoint characteristics and set the CNAK and EPENA (endpoint enable) bits.
3. When transmitting non-zero length data packet, the application must poll the OTG\_DTXFSTSx register (where x is the FIFO number associated with that endpoint) to determine whether there is enough space in the data FIFO. The application can optionally use TXFE (in OTG\_DIEPINTx) before writing the data.

- **Generic periodic IN data transfers**

This section describes a typical periodic IN data transfer.

Application requirements:

1. Application requirements 1, 2, 3, and 4 of [Generic non-periodic IN data transfers on page 2695](#) also apply to periodic IN data transfers, except for a slight modification of requirement 2.
  - The application can only transmit multiples of maximum-packet-size data packets or multiples of maximum-packet-size packets, plus a short packet at the end. To

transmit a few maximum-packet-size packets and a short packet at the end of the transfer, the following conditions must be met:

transfer size[EPNUM] =  $x \times \text{MPSIZ}[\text{EPNUM}] + \text{sp}$

(where  $x$  is an integer  $\geq 0$ , and  $0 \leq \text{sp} < \text{MPSIZ}[\text{EPNUM}]$ )

If ( $\text{sp} > 0$ ), packet count[EPNUM] =  $x + 1$

Otherwise, packet count[EPNUM] =  $x$ ;

MCNT[EPNUM] = packet count[EPNUM]

- The application cannot transmit a zero-length data packet at the end of a transfer. It can transmit a single zero-length data packet by itself. To transmit a single zero-length data packet:
  - transfer size[EPNUM] = 0
  - packet count[EPNUM] = 1
  - MCNT[EPNUM] = packet count[EPNUM]
- 2. The application can only schedule data transfers one frame at a time.
  - $(\text{MCNT} - 1) \times \text{MPSIZ} \leq \text{XFERSIZ} \leq \text{MCNT} \times \text{MPSIZ}$
  - PKTCNT = MCNT (in OTG\_DIEPTSIZx)
  - If  $\text{XFERSIZ} < \text{MCNT} \times \text{MPSIZ}$ , the last data packet of the transfer is a short packet.
  - Note that: MCNT is in OTG\_DIEPTSIZx, MPSIZ is in OTG\_DIEPCTLx, PKTCNT is in OTG\_DIEPTSIZx and XFERSIZ is in OTG\_DIEPTSIZx
- 3. The complete data to be transmitted in the frame must be written into the transmit FIFO by the application, before the IN token is received. Even when 1 word of the data to be transmitted per frame is missing in the transmit FIFO when the IN token is received, the core behaves as when the FIFO is empty. When the transmit FIFO is empty:
  - A zero data length packet would be transmitted on the USB for isochronous IN endpoints
  - A NAK handshake would be transmitted on the USB for interrupt IN endpoints

Internal data flow:

1. The application must set the transfer size and packet count fields in the endpoint-specific registers and enable the endpoint to transmit the data.
2. The application must also write the required data to the associated transmit FIFO for the endpoint.
3. Every time the application writes a packet to the transmit FIFO, the transfer size for that endpoint is decremented by the packet size. The data are fetched from application memory until the transfer size for the endpoint becomes 0.
4. When an IN token is received for a periodic endpoint, the core transmits the data in the FIFO, if available. If the complete data payload (complete packet, in dedicated FIFO

- mode) for the frame is not present in the FIFO, then the core generates an IN token received when Tx FIFO empty interrupt for the endpoint.
- A zero-length data packet is transmitted on the USB for isochronous IN endpoints
  - A NAK handshake is transmitted on the USB for interrupt IN endpoints
5. The packet count for the endpoint is decremented by 1 under the following conditions:
    - For isochronous endpoints, when a zero- or non-zero-length data packet is transmitted
    - For interrupt endpoints, when an ACK handshake is transmitted
    - When the transfer size and packet count are both 0, the transfer completed interrupt for the endpoint is generated and the endpoint enable is cleared.
  6. At the “Periodic frame Interval” (controlled by PFIVL in OTG\_DCFG), when the core finds non-empty any of the isochronous IN endpoint FIFOs scheduled for the current frame non-empty, the core generates an IISOIXFR interrupt in OTG\_GINTSTS.

Application programming sequence:

1. Program the OTG\_DIEPCTLx register with the endpoint characteristics and set the CNAK and EPENA bits.
2. Write the data to be transmitted in the next frame to the transmit FIFO.
3. Asserting the ITTXFE interrupt (in OTG\_DIEPINTx) indicates that the application has not yet written all data to be transmitted to the transmit FIFO.
4. If the interrupt endpoint is already enabled when this interrupt is detected, ignore the interrupt. If it is not enabled, enable the endpoint so that the data can be transmitted on the next IN token attempt.
5. Asserting the XFRC interrupt (in OTG\_DIEPINTx) with no ITTXFE interrupt in OTG\_DIEPINTx indicates the successful completion of an isochronous IN transfer. A read to the OTG\_DIEPTSIZx register must give transfer size = 0 and packet count = 0, indicating all data were transmitted on the USB.
6. Asserting the XFRC interrupt (in OTG\_DIEPINTx), with or without the ITTXFE interrupt (in OTG\_DIEPINTx), indicates the successful completion of an interrupt IN transfer. A read to the OTG\_DIEPTSIZx register must give transfer size = 0 and packet count = 0, indicating all data were transmitted on the USB.
7. Asserting the incomplete isochronous IN transfer (IISOIXFR) interrupt in OTG\_GINTSTS with none of the aforementioned interrupts indicates the core did not receive at least 1 periodic IN token in the current frame.

- **Incomplete isochronous IN data transfers**

This section describes what the application must do on an incomplete isochronous IN data transfer.

Internal data flow:

1. An isochronous IN transfer is treated as incomplete in one of the following conditions:
  - a) The core receives a corrupted isochronous IN token on at least one isochronous IN endpoint. In this case, the application detects an incomplete isochronous IN transfer interrupt (IISOIXFR in OTG\_GINTSTS).
  - b) The application is slow to write the complete data payload to the transmit FIFO and an IN token is received before the complete data payload is written to the FIFO. In this case, the application detects an IN token received when Tx FIFO empty interrupt in OTG\_DIEPINTx. The application can ignore this interrupt, as it

eventually results in an incomplete isochronous IN transfer interrupt (IISOIXFR in OTG\_GINTSTS) at the end of periodic frame.

The core transmits a zero-length data packet on the USB in response to the received IN token.

2. The application must stop writing the data payload to the transmit FIFO as soon as possible.
3. The application must set the NAK bit and the disable bit for the endpoint.
4. The core disables the endpoint, clears the disable bit, and asserts the endpoint disable interrupt for the endpoint.

Application programming sequence:

1. The application can ignore the IN token received when Tx FIFO empty interrupt in OTG\_DIEPINTx on any isochronous IN endpoint, as it eventually results in an incomplete isochronous IN transfer interrupt (in OTG\_GINTSTS).
2. Assertion of the incomplete isochronous IN transfer interrupt (in OTG\_GINTSTS) indicates an incomplete isochronous IN transfer on at least one of the isochronous IN endpoints.
3. The application must read the endpoint control register for all isochronous IN endpoints to detect endpoints with incomplete IN data transfers.
4. The application must stop writing data to the Periodic Transmit FIFOs associated with these endpoints on the AHB.
5. Program the following fields in the OTG\_DIEPCTLx register to disable the endpoint:
  - SNAK = 1 in OTG\_DIEPCTLx
  - EPDIS = 1 in OTG\_DIEPCTLx
6. The assertion of the endpoint disabled interrupt in OTG\_DIEPINTx indicates that the core has disabled the endpoint.
  - At this point, the application must flush the data in the associated transmit FIFO or overwrite the existing data in the FIFO by enabling the endpoint for a new transfer in the next microframe. To flush the data, the application must use the OTG\_GRSTCTL register.

- **Stalling non-isochronous IN endpoints**

This section describes how the application can stall a non-isochronous endpoint.

Application programming sequence:

1. Disable the IN endpoint to be stalled. Set the STALL bit as well.
2. EPDIS = 1 in OTG\_DIEPCTLx, when the endpoint is already enabled
  - STALL = 1 in OTG\_DIEPCTLx
  - The STALL bit always takes precedence over the NAK bit
3. Assertion of the endpoint disabled interrupt (in OTG\_DIEPINTx) indicates to the application that the core has disabled the specified endpoint.
4. The application must flush the non-periodic or periodic transmit FIFO, depending on the endpoint type. In case of a non-periodic endpoint, the application must re-enable the other non-periodic endpoints that do not need to be stalled, to transmit data.
5. Whenever the application is ready to end the STALL handshake for the endpoint, the STALL bit must be cleared in OTG\_DIEPCTLx.
6. If the application sets or clears a STALL bit for an endpoint due to a SetFeature.Endpoint Halt command or ClearFeature.Endpoint Halt command, the STALL bit must be set or cleared before the application sets up the status stage transfer on the control endpoint.

Special case: stalling the control OUT endpoint

The core must stall IN/OUT tokens if, during the data stage of a control transfer, the host sends more IN/OUT tokens than are specified in the SETUP packet. In this case, the application must enable the ITTXFE interrupt in OTG\_DIEPINTx and the OTEPDIS interrupt in OTG\_DOEPINTx during the data stage of the control transfer, after the core has transferred the amount of data specified in the SETUP packet. Then, when the application receives this interrupt, it must set the STALL bit in the corresponding endpoint control register, and clear this interrupt.

### 62.15.7 Worst case response time

When the OTG\_HS controller acts as a device, there is a worst case response time for any tokens that follow an isochronous OUT. This worst case response time depends on the AHB clock frequency.

The core registers are in the AHB domain, and the core does not accept another token before updating these register values. The worst case is for any token following an isochronous OUT, because for an isochronous transaction, there is no handshake and the next token could come sooner. This worst case value is 7 PHY clocks when the AHB clock is the same as the PHY clock. When the AHB clock is faster, this value is smaller.

If this worst case condition occurs, the core responds to bulk/interrupt tokens with a NAK and drops isochronous and SETUP tokens. The host interprets this as a timeout condition for SETUP and retries the SETUP packet. For isochronous transfers, the Incomplete isochronous IN transfer interrupt (IISOIXFR) and Incomplete isochronous OUT transfer interrupt (IISOOXFR) inform the application that isochronous IN/OUT packets were dropped.

#### Choosing the value of TRDT in OTG\_GUSBCFG

The value in TRDT (OTG\_GUSBCFG) is the time it takes for the MAC, in terms of PHY clocks after it has received an IN token, to get the FIFO status, and thus the first data from the PFC block. This time involves the synchronization delay between the PHY and AHB clocks. The worst case delay for this is when the AHB clock is the same as the PHY clock. In this case, the delay is 5 clocks.

Once the MAC receives an IN token, this information (token received) is synchronized to the AHB clock by the PFC (the PFC runs on the AHB clock). The PFC then reads the data from the SPRAM and writes them into the dual clock source buffer. The MAC then reads the data out of the source buffer (4 deep).

If the AHB is running at a higher frequency than the PHY, the application can use a smaller value for TRDT (in OTG\_GUSBCFG).

Figure 745 has the following signals:

- tkn\_rcvd: Token received information from MAC to PFC
- dynced\_tkn\_rcvd: Doubled sync tkn\_rcvd, from PCLK to HCLK domain
- spr\_read: Read to SPRAM
- spr\_addr: Address to SPRAM
- spr\_rdata: Read data from SPRAM
- srcbuf\_push: Push to the source buffer
- srcbuf\_rdata: Read data from the source buffer. Data seen by MAC

To calculate the value of TRDT, refer to [Table 508: TRDT values](#).

Figure 745. TRDT max timing case

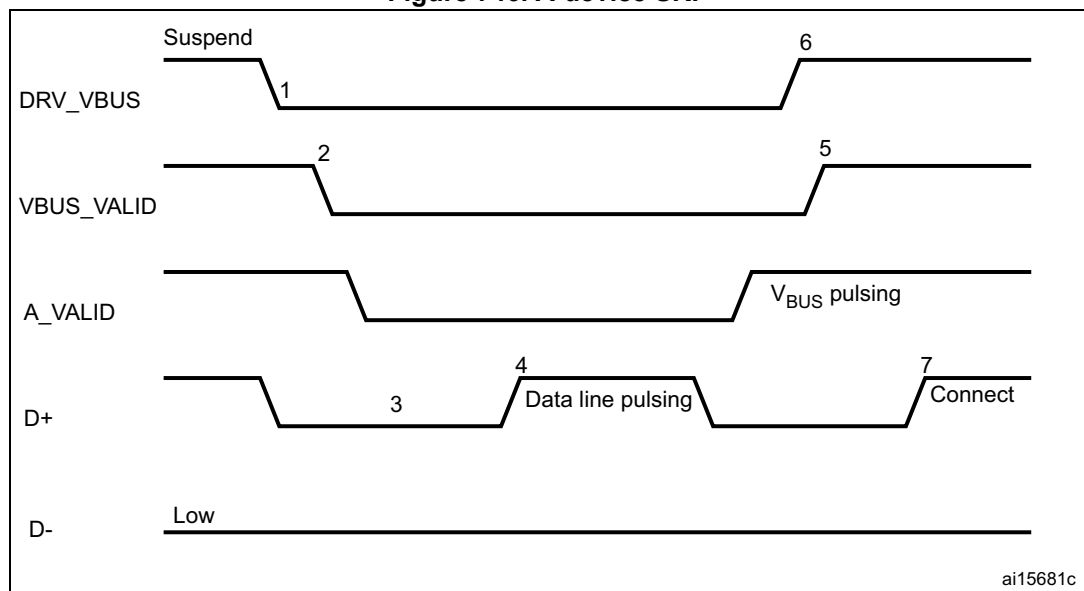

### 62.15.8 OTG programming model

The OTG\_HS controller is an OTG device supporting HNP and SRP. When the core is connected to an “A” plug, it is referred to as an A-device. When the core is connected to a “B” plug it is referred to as a B-device. In host mode, the OTG\_HS controller turns off  $V_{BUS}$  to conserve power. SRP is a method by which the B-device signals the A-device to turn on  $V_{BUS}$  power. A device must perform both data-line pulsing and  $V_{BUS}$  pulsing, but a host can detect either data-line pulsing or  $V_{BUS}$  pulsing for SRP. HNP is a method by which the B-device negotiates and switches to host role. In Negotiated mode after HNP, the B-device suspends the bus and reverts to the device role.

#### A-device session request protocol

The application must set the SRP-capable bit in the core USB configuration register. This enables the OTG\_HS controller to detect SRP as an A-device.

Figure 746. A-device SRP

1. DRV\_VBUS =  $V_{BUS}$  drive signal to the PHY  
 VBUS\_VALID =  $V_{BUS}$  valid signal from PHY  
 A\_VALID = A-peripheral  $V_{BUS}$  level signal to PHY  
 D+ = Data plus line  
 D- = Data minus line

The following points refer and describe the signal numeration shown in the [Figure 746](#):

1. To save power, the application suspends and turns off port power when the bus is idle by writing the port suspend and port power bits in the host port control and status register.
2. PHY indicates port power off by deasserting the VBUS\_VALID signal.
3. The device must detect SE0 for at least 2 ms to start SRP when  $V_{BUS}$  power is off.
4. To initiate SRP, the device turns on its data line pull-up resistor for 5 to 10 ms. The OTG\_HS controller detects data-line pulsing.
5. The device drives  $V_{BUS}$  above the A-device session valid (2.0 V minimum) for  $V_{BUS}$  pulsing.  
 The OTG\_HS controller interrupts the application on detecting SRP. The session

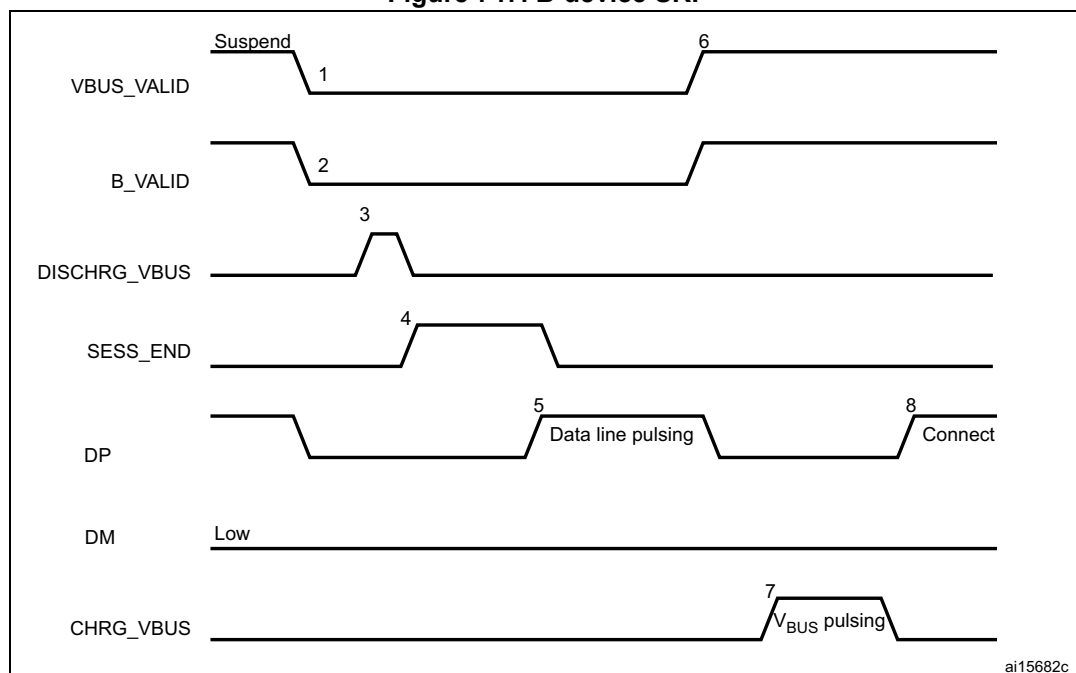

request detected bit is set in Global interrupt status register (SRQINT set in OTG\_GINTSTS).

6. The application must service the session request detected interrupt and turn on the port power bit by writing the port power bit in the host port control and status register. The PHY indicates port power-on by asserting the VBUS\_VALID signal.
7. When the USB is powered, the device connects, completing the SRP process.

### B-device session request protocol

The application must set the SRP-capable bit in the core USB configuration register. This enables the OTG\_HS controller to initiate SRP as a B-device. SRP is a means by which the OTG\_HS controller can request a new session from the host.

Figure 747. B-device SRP

1. VBUS\_VALID = V<sub>BUS</sub> valid signal from PHY  
 B\_VALID = B-peripheral valid session to PHY  
 DISCHRG\_VBUS = discharge signal to PHY  
 SESS\_END = session end signal to PHY  
 CHRГ\_VBUS = charge V<sub>BUS</sub> signal to PHY  
 DP = Data plus line  
 DM = Data minus line

The following points refer and describe the signal numeration shown in the [Figure 747](#):

1. To save power, the host suspends and turns off port power when the bus is idle. The OTG\_HS controller sets the early suspend bit in the core interrupt register after 3 ms of bus idleness. Following this, the OTG\_HS controller sets the USB suspend bit in the core interrupt register. The OTG\_HS controller informs the PHY to discharge V<sub>BUS</sub>.
2. The PHY indicates the session's end to the device. This is the initial condition for SRP. The OTG\_HS controller requires 2 ms of SE0 before initiating SRP. For a USB 1.1 full-speed serial transceiver, the application must wait until V<sub>BUS</sub> discharges to 0.2 V after BSVLD (in OTG\_GOTGCTL) is deasserted. This discharge

- time can be obtained from the transceiver vendor and varies from one transceiver to another.
3. The OTG\_HS core informs the PHY to speed up  $V_{BUS}$  discharge.
  4. The application initiates SRP by writing the session request bit in the OTG control and status register. The OTG\_HS controller perform data-line pulsing followed by  $V_{BUS}$  pulsing.
  5. The host detects SRP from either the data-line or  $V_{BUS}$  pulsing, and turns on  $V_{BUS}$ . The PHY indicates  $V_{BUS}$  power-on to the device.
  6. The OTG\_HS controller performs  $V_{BUS}$  pulsing. The host starts a new session by turning on  $V_{BUS}$ , indicating SRP success. The OTG\_HS controller interrupts the application by setting the session request success status change bit in the OTG interrupt status register. The application reads the session request success bit in the OTG control and status register.
  7. When the USB is powered, the OTG\_HS controller connects, completing the SRP process.

**A-device host negotiation protocol**

HNP switches the USB host role from the A-device to the B-device. The application must set the HNP-capable bit in the core USB configuration register to enable the OTG\_HS controller to perform HNP as an A-device.

**Figure 748. A-device HNP**

1. DPPULLDOWN = signal from core to PHY to enable/disable the pull-down on the DP line inside the PHY.  
DMPULLDOWN = signal from core to PHY to enable/disable the pull-down on the DM line inside the PHY.

The following points refer and describe the signal numeration shown in the [Figure 748](#):

1. The OTG\_HS controller sends the B-device a SetFeature b\_hnp\_enable descriptor to enable HNP support. The B-device's ACK response indicates that the B-device supports HNP. The application must set host Set HNP enable bit in the OTG control

and status register to indicate to the OTG\_HS controller that the B-device supports HNP.

2. When it has finished using the bus, the application suspends by writing the port suspend bit in the host port control and status register.
3. When the B-device observes a USB suspend, it disconnects, indicating the initial condition for HNP. The B-device initiates HNP only when it must switch to the host role; otherwise, the bus continues to be suspended.

The OTG\_HS controller sets the host negotiation detected interrupt in the OTG interrupt status register, indicating the start of HNP.

The OTG\_HS controller deasserts the DM pull down and DM pull down in the PHY to indicate a device role. The PHY enables the OTG\_DP pull-up resistor to indicate a connect for B-device.

The application must read the current mode bit in the OTG control and status register to determine device mode operation.

4. The B-device detects the connection, issues a USB reset, and enumerates the OTG\_HS controller for data traffic.
5. The B-device continues the host role, initiating traffic, and suspends the bus when done.

The OTG\_HS controller sets the early suspend bit in the core interrupt register after 3 ms of bus idleness. Following this, the OTG\_HS controller sets the USB suspend bit in the core interrupt register.

6. In Negotiated mode, the OTG\_HS controller detects the suspend, disconnects, and switches back to the host role. The OTG\_HS controller asserts the DM pull down and DM pull down in the PHY to indicate its assumption of the host role.
7. The OTG\_HS controller sets the connector ID status change interrupt in the OTG interrupt status register. The application must read the connector ID status in the OTG control and status register to determine the OTG\_HS controller operation as an A-device. This indicates the completion of HNP to the application. The application must read the Current mode bit in the OTG control and status register to determine host mode operation.
8. The B-device connects, completing the HNP process.

### **B-device host negotiation protocol**

HNP switches the USB host role from B-device to A-device. The application must set the HNP-capable bit in the core USB configuration register to enable the OTG\_HS controller to perform HNP as a B-device.

Figure 749. B-device HNP

1. DPPULLDOWN = signal from core to PHY to enable/disable the pull-down on the DP line inside the PHY.  
DMPULLDOWN = signal from core to PHY to enable/disable the pull-down on the DM line inside the PHY.

The following points refer and describe the signal numeration shown in the [Figure 749](#):

1. The A-device sends the SetFeature b\_hnp\_enable descriptor to enable HNP support. The OTG\_HS controller's ACK response indicates that it supports HNP. The application must set the device HNP enable bit in the OTG control and status register to indicate HNP support.

The application sets the HNP request bit in the OTG control and status register to indicate to the OTG\_HS controller to initiate HNP.

2. When it has finished using the bus, the A-device suspends by writing the port suspend bit in the host port control and status register.

The OTG\_HS controller sets the Early suspend bit in the core interrupt register after 3 ms of bus idleness. Following this, the OTG\_HS controller sets the USB suspend bit in the core interrupt register.

The OTG\_HS controller disconnects and the A-device detects SE0 on the bus, indicating HNP. The OTG\_HS controller asserts the DP pull down and DM pull down in the PHY to indicate its assumption of the host role.

The A-device responds by activating its OTG\_DP pull-up resistor within 3 ms of detecting SE0. The OTG\_HS controller detects this as a connect.

The OTG\_HS controller sets the host negotiation success status change interrupt in the OTG interrupt status register, indicating the HNP status. The application must read the host negotiation success bit in the OTG control and status register to determine

host negotiation success. The application must read the current Mode bit in the core interrupt register (OTG\_GINTSTS) to determine host mode operation.

3. The application sets the reset bit (PRST in OTG\_HPRT) and the OTG\_HS controller issues a USB reset and enumerates the A-device for data traffic.
4. The OTG\_HS controller continues the host role of initiating traffic, and when done, suspends the bus by writing the port suspend bit in the host port control and status register.
5. In Negotiated mode, when the A-device detects a suspend, it disconnects and switches back to the host role. The OTG\_HS controller deasserts the DP pull down and DM pull down in the PHY to indicate the assumption of the device role.
6. The application must read the current mode bit in the core interrupt (OTG\_GINTSTS) register to determine the host mode operation.
7. The OTG\_HS controller connects, completing the HNP process.

## 63 HDMI-CEC controller (CEC)

### 63.1 Introduction

Consumer electronics control (CEC) is part of HDMI (high-definition multimedia interface) standard. It contains a protocol that provides high-level control functions between various audiovisual products. CEC operates at low speeds, with minimum processing and memory overhead.

The HDMI-CEC controller provides hardware support for this protocol.

### 63.2 HDMI-CEC controller main features

- Complies with HDMI-CEC v1.4 specification
- Independent 32 kHz CEC kernel (refer to *section RCC kernel clock distribution*)
- Works in Stop mode for ultra-low-power applications
- Configurable signal-free time before start of transmission
  - Automatic by hardware, according to CEC state and transmission history
  - Fixed by software (7 timing options)
- Configurable peripheral address (OAR)
- Supports Listen mode
  - Enables reception of CEC messages sent to destination address different from OAR without interfering with the CEC line
- Configurable Rx-tolerance margin
  - Standard tolerance
  - Extended tolerance
- Receive-error detection
  - Bit rising error (BRE), with optional stop of reception (BRESTP)
  - Short bit period error (SBPE)
  - Long bit period error (LBPE)
- Configurable error-bit generation
  - on BRE detection (BREGEN)
  - on LBPE detection (LBPEGEN)
  - always generated on SBPE detection
- Transmission error detection (TXERR)
- Arbitration lost detection (ARBLST)
  - with automatic transmission retry
- Transmission underrun detection (TXUDR)
- Reception overrun detection (RXOVR)

## 63.3 HDMI-CEC functional description

### 63.3.1 HDMI-CEC pin and internal signals

The CEC bus consists of a single bidirectional line that is used to transfer data in and out of the device. It is connected to a +3.3 V supply voltage via a 27 kΩ pull-up resistor. The output stage of the device must have an open-drain or open-collector to allow a wired-AND connection.

The HDMI-CEC controller manages the CEC bidirectional line as an alternate function of a standard GPIO, assuming that it is configured as alternate function open drain. The 27 kΩ pull-up must be added externally to the microcontroller.

To not interfere with the CEC bus when the application power is removed, it is mandatory to isolate the CEC pin from the bus in such conditions. This can be done by using a MOS transistor, as shown on [Figure 750](#).

[Table 512](#) lists the internal signals that are exchanged between the HDMI-CEC and other functional blocks (such as RCC and EXTI).

**Table 511. HDMI pin**

Name	Signal type	Remarks
CEC	Bidirectional	Two states: – 1 = high impedance – 0 = low impedance A 27 kΩ resistor must be added externally.

**Table 512. HDMI-CEC internal input/output signals**

Signal name	Signal type	Description
cec_wkup	Digital output	HDMI-CEC wakeup signal
cec_it	Digital output	HDMI-CEC interrupt signal
cec_pclk	Digital input	APB clock
cec_ker_ck	Digital input	HDMI-CEC kernel clock

### 63.3.2 HDMI-CEC block diagram

Figure 750. HDMI-CEC block diagram

### 63.3.3 Message description

All transactions on the CEC line consist of an initiator and one or more followers. The initiator is responsible for sending the message structure and the data. The follower is the recipient of any data and is responsible for setting any acknowledgment bits.

A message is conveyed in a single frame that consists of a start bit followed by a header block and optionally an opcode and a variable number of operand blocks.

All these blocks are made of a 8-bit payload - most significant bit is transmitted first - followed by an end of message (EOM) bit and an acknowledge (ACK) bit.

The EOM bit is set in the last block of a message and kept reset in all others. In case a message contains additional blocks after an EOM is indicated, those additional blocks must be ignored. The EOM bit may be set in the header block to 'ping' other devices, to make sure they are active.

The acknowledge bit is always set to high impedance by the initiator so that it can be driven low either by the follower that has read its own address in the header, or by the follower that needs to reject a broadcast message.

The header consists of the source logical address field, and the destination logical address field. Note that the special address 0xF is used for broadcast messages.

Figure 751. Message structure

Figure 752. Blocks

### 63.3.4 Bit timing

The format of the start bit is unique and identifies the start of a message. It must be validated by its low duration and its total duration.

All remaining data bits in the message, after the start bit, have consistent timing. The high-to-low transition at the end of the data bit is the start of the next data bit except for the final bit where the CEC line remains high.

Figure 753. Bit timings

## 63.4 Arbitration

All devices transmitting - or retransmitting - a message onto the CEC line must ensure that it has been inactive for a number of bit periods. This signal-free time is defined as the time

starting from the final bit of the previous frame and depends on the initiating device and the current status as shown in the figure below.

**Figure 754. Signal free time**

Since only one initiator is allowed at any one time, an arbitration mechanism is provided to avoid conflict when more than one initiator begins transmitting at the same time.

CEC line arbitration starts with the leading edge of the start bit and continues until the end of the initiator address bits within the header block. During this period, the initiator must monitor the CEC line, if whilst driving the line to high impedance it reads it back to 0. Assuming then it has lost arbitration, it stops transmitting and becomes a follower.

**Figure 755. Arbitration phase**

Figure 756 shows an example for a SFT of three nominal bit periods.

**Figure 756. SFT of three nominal bit periods**

A configurable time window is counted before starting the transmission.

In the SFT = 0 configuration, HDMI-CEC performs automatic SFT calculation ensuring compliance with the HDMI-CEC standard:

- 2.5 data bit periods if the CEC is the last bus initiator with unsuccessful transmission
- 4 data bit periods if the CEC is the new bus initiator
- 6 data bit periods if the CEC is the last bus initiator with successful transmission

This is done to guarantee the maximum priority to a failed transmission and the lowest one to the last initiator that completed successfully its transmission.

Otherwise there is the possibility to configure the SFT bits to count a fixed timing value. Possible values are 0.5, 1.5, 2.5, 3.5, 4.5, 5.5, 6.5 data bit periods.

### 63.4.1 SFT option bit

In case of SFTOPT = 0 configuration, SFT starts being counted when the start-of-transmission command is set by software (TXSOM = 1).

In case of SFTOPT = 1, SFT starts automatically being counted by the HDMI-CEC device when a bus-idle or line error condition is detected. If the SFT timer is completed at the time TXSOM command is set then transmission starts immediately without latency. If the SFT timer is still running instead, the system waits until the timer elapses before transmission can start.

In case of SFTOPT = 1 a bus-event condition starting the SFT timer is detected in the following cases:

- In case of a regular end of transmission/reception, when TXEND/RXEND bits are set at the minimum nominal data bit duration of the last bit in the message (ACK bit).
- In case of a transmission error detection, SFT timer starts when the TXERR transmission error is detected (TXERR = 1).
- In case of a missing acknowledge from the CEC follower, the SFT timer starts when the TXACK bit is set, that is at the nominal sampling time of the ACK bit.
- In case of a transmission underrun error, the SFT timer starts when the TXUDR bit is set at the end of the ACK bit.
- In case of a receive error detection implying reception abort, the SFT timer starts at the same time the error is detected. If an error bit is generated, then SFT starts being counted at the end of the error bit.
- In case of a wrong start bit or of any uncodified low impedance bus state from idle, the SFT timer is restarted as soon as the bus comes back to hi-impedance idleness.

## 63.5 Error handling

### 63.5.1 Bit error

If a data bit - excluding the start bit - is considered invalid, the follower is expected to notify such error by generating a low bit period on the CEC line of 1.4 to 1.6 times the nominal data bit period (3.6 ms nominally).

Figure 757. Error bit timing

### 63.5.2 Message error

A message is considered lost and therefore may be retransmitted under the following conditions:

- a message is not acknowledged in a directly addressed message
- a message is negatively acknowledged in a broadcast message
- a low impedance is detected on the CEC line while it is not expected (line error)

Three kinds of error flag can be detected when the CEC interface is receiving a data bit:

### 63.5.3 Bit rising error (BRE)

BRE (bit rising error) is set when a bit rising edge is detected outside the windows where it is expected (see [Figure 758](#)). BRE flag also generates a CEC interrupt if the BREIE = 1.

In the case of a BRE detection, the message reception can be stopped according to the BRESTP bit value and an error bit can be generated if BREGEN bit is set.

When BRE is detected in a broadcast message with BRESTP = 1 an error bit is generated even if BREGEN = 0 to enforce initiator's retry of the failed transmission. Error bit generation can be disabled by configuring BREGEN = 0, BRDNOGEN = 1.

### 63.5.4 Short bit period error (SBPE)

SBPE is set when a bit falling edge is detected earlier than expected (see [Figure 758](#)). SBPE flag also generates a CEC interrupt if the SBPEIE = 1.

An error bit is always generated on the line in case of a SBPE error detection. An error bit is not generated upon SBPE detection only when Listen mode is set (LSTN = 1) and the following conditions are met:

- A directly addressed message is received containing SBPE
- A broadcast message is received containing SBPE AND BRDNOGEN = 1

### 63.5.5 Long bit period error (LBPE)

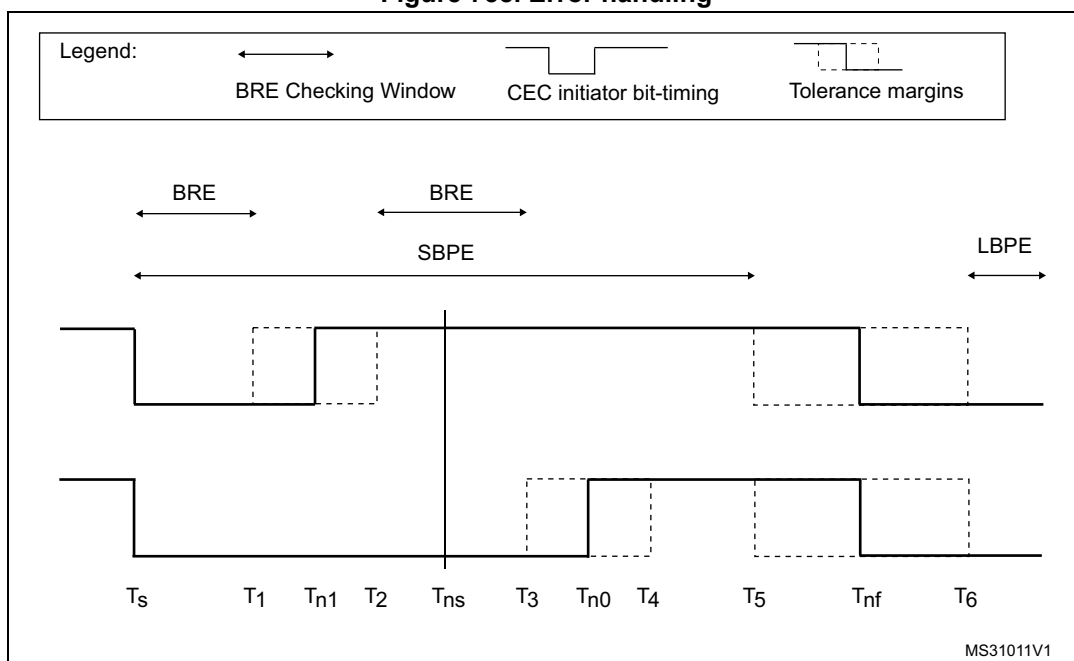

LBPE is set when a bit falling edge is not detected in a valid window (see [Figure 758](#)). LBPE flag also generates a CEC interrupt if the LBPEIE = 1.

LBPE always stops the reception, an error bit is generated on the line when LBPEGEN bit is set.

When LBPE is detected in a broadcast message an error bit is generated even if LBPEGEN = 0 to enforce initiator's retry of the failed transmission. Error bit generation can be disabled by configuring LBPEGEN = 0, BRDNOGEN = 1.

*Note:* The BREGEN = 1, BRESTP = 0 configuration must be avoided.

Figure 758. Error handling

MS31011V1

Table 513. Error handling timing parameters

Time	RXTOL	ms	Description
$T_s$	x	0	Bit start event.
$T_1$	1	0.3	The earliest time for a low - high transition when indicating a logical 1.
	0	0.4	
$T_{n1}$	x	0.6	The nominal time for a low - high transition when indicating a logical 1.
$T_2$	0	0.8	The latest time for a low - high transition when indicating a logical 1.
	1	0.9	
$T_{ns}$	x	1.05	Nominal sampling time.
$T_3$	1	1.2	The earliest time a device is permitted return to a high impedance state (logical 0).
	0	1.3	
$T_{n0}$	x	1.5	The nominal time a device is permitted return to a high impedance state (logical 0).
$T_4$	0	1.7	The latest time a device is permitted return to a high impedance state (logical 0).
	1	1.8	
$T_5$	1	1.85	The earliest time for the start of a following bit.
	0	2.05	
$T_{nf}$	x	2.4	The nominal data bit period.
$T_6$	0	2.75	The latest time for the start of a following bit.
	1	2.95	

### 63.5.6 Transmission error detection (TXERR)

The CEC initiator sets the TXERR flag if detecting low impedance on the CEC line when it is transmitting high impedance and is not expecting a follower asserted bit. TXERR flag also generates a CEC interrupt if the TXERRIE = 1.

TXERR assertion stops the message transmission. Application is in charge to retry the failed transmission up to five times.

TXERR checks are performed differently depending on the different states of the CEC line and on the RX tolerance configuration.

Figure 759. TXERR detection

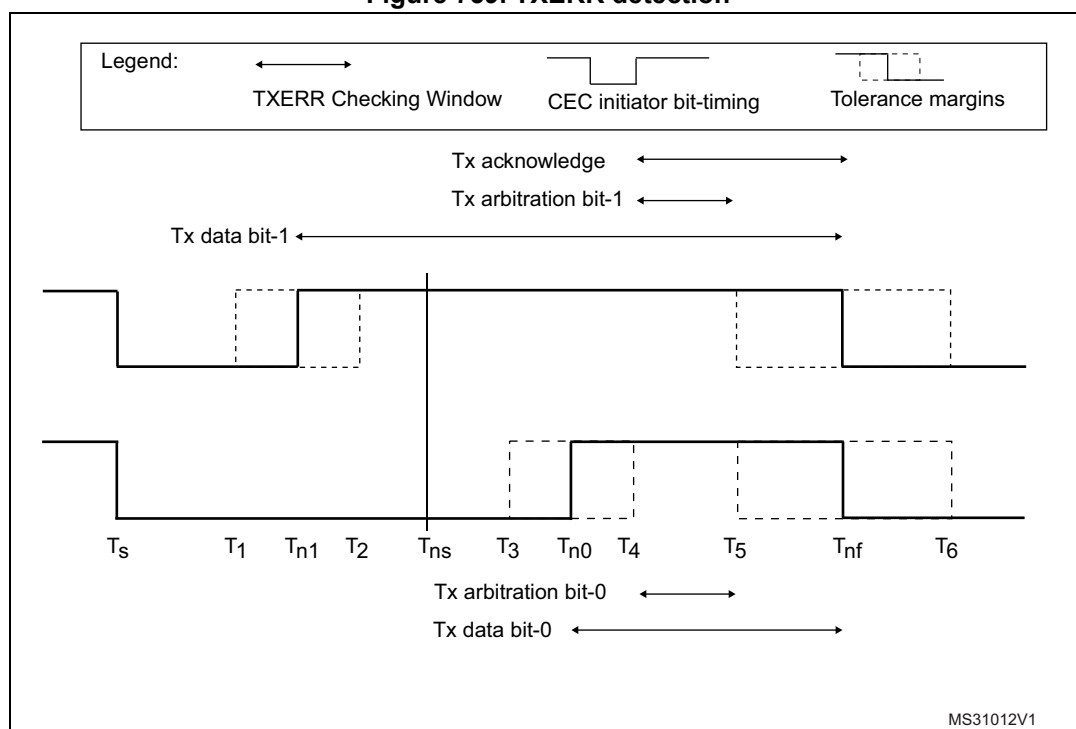

Table 514. TXERR timing parameters

Time	RXTOL	ms	Description
$T_s$	x	0	Bit start event.
$T_1$	1	0.3	The earliest time for a low - high transition when indicating a logical 1.
	0	0.4	
$T_{n1}$	x	0.6	The nominal time for a low - high transition when indicating a logical 1.
$T_2$	0	0.8	The latest time for a low - high transition when indicating a logical 1.
	1	0.9	
$T_{ns}$	x	1.05	Nominal sampling time.
$T_3$	1	1.2	The earliest time a device is permitted return to a high impedance state (logical 0).
	0	1.3	

Table 514. TXERR timing parameters (continued)

Time	RXTOL	ms	Description
$T_{n0}$	x	1.5	The nominal time a device is permitted return to a high impedance state (logical 0).
$T_4$	0	1.7	The latest time a device is permitted return to a high impedance state (logical 0).
	1	1.8	
$T_5$	1	1.85	The earliest time for the start of a following bit.
	0	2.05	
$T_{nf}$	x	2.4	The nominal data bit period.
$T_6$	0	2.75	The latest time for the start of a following bit.
	1	2.95	

## 63.6 HDMI-CEC interrupts

An interrupt can be produced:

- during reception if a receive block transfer is finished or if a receive error occurs.
- during transmission if a transmit block transfer is finished or if a transmit error occurs.

Table 515. HDMI-CEC interrupts

Interrupt event	Event flag	Enable control bit
Rx-byte received	RXBR	RXBRIE
End of reception	RXEND	RXENDIE
Rx-overflow	RXOVR	RXOVRIE
Rxbit rising error	BRE	BREIE
Rx-short bit period error	SBPE	SBPEIE
Rx-long bit period error	LBPE	LBPEIE
Rx-missing acknowledge error	RXACKE	RXACKEIE
Arbitration lost	ARBLST	ARBLSTIE
Tx-byte request	TXBR	TXBRIE
End of transmission	TXEND	TXENDIE
Tx-buffer underrun	TXUDR	TXUDRIE
Tx-error	TXERR	TXERRIE
Tx-missing acknowledge error	TXACKE	TXACKEIE

## 63.7 HDMI-CEC registers

Refer to [Section 1.2](#) for a list of abbreviations used in register descriptions. The registers have to be accessed by words (32 bits).

### 63.7.1 CEC control register (CEC\_CR)

Address offset: 0x00

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TXE OM	TXS OM	CECEN
													rs	rs	rw

Bits 31:3 Reserved, must be kept at reset value.

#### Bit 2 TXEOM: Tx end of message

The TXEOM bit is set by software to command transmission of the last byte of a CEC message.

TXEOM is cleared by hardware at the same time and under the same conditions as for TXSOM.

0: TXDR data byte is transmitted with EOM = 0

1: TXDR data byte is transmitted with EOM = 1

*Note: TXEOM must be set when CECEN = 1.*

*TXEOM must be set before writing transmission data to TXDR.*

*If TXEOM is set when TXSOM = 0, transmitted message consists of 1 byte (HEADER) only (PING message).*

#### Bit 1 TXSOM: Tx start of message

TXSOM is set by software to command transmission of the first byte of a CEC message. If the CEC message consists of only one byte, TXEOM must be set before of TXSOM.

Start-bit is effectively started on the CEC line after SFT is counted. If TXSOM is set while a message reception is ongoing, transmission starts after the end of reception.

TXSOM is cleared by hardware after the last byte of the message is sent with a positive acknowledge (TXEND = 1), in case of transmission underrun (TXUDR = 1), negative acknowledge (TXACKE = 1), and transmission error (TXERR = 1). It is also cleared by CECEN = 0. It is not cleared and transmission is automatically retried in case of arbitration lost (ARBLST = 1).

TXSOM can be also used as a status bit informing application whether any transmission request is pending or under execution. The application can abort a transmission request at any time by clearing the CECEN bit.

0: No CEC transmission is on-going

1: CEC transmission command

*Note: TXSOM must be set when CECEN = 1.*

*TXSOM must be set when transmission data is available into TXDR.*

*HEADER first four bits containing own peripheral address are taken from TXDR[7:4], not from CEC\_CFGR.OAR that is used only for reception.*

Bit 0 **CECEN**: CEC enable

The CECEN bit is set and cleared by software. CECEN = 1 starts message reception and enables the TXSOM control. CECEN = 0 disables the CEC peripheral, clears all bits of CEC\_CR register and aborts any on-going reception or transmission.

0: CEC peripheral is off.

1: CEC peripheral is on.

### 63.7.2 CEC configuration register (CEC\_CFGR)

This register is used to configure the HDMI-CEC controller.

Address offset: 0x04

Reset value: 0x0000 0000

**Caution:** It is mandatory to write CEC\_CFGR only when CECEN = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LSTN	OAR[14:0]														
r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	SFT OP	BRDN OGEN	LBPE GEN	BRE GEN	BRE STP	RX TOL	SFT[2:0]		
							r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bit 31 **LSTN**: Listen mode

LSTN bit is set and cleared by software.

0: CEC peripheral receives only message addressed to its own address (OAR). Messages addressed to different destination are ignored. Broadcast messages are always received.

1: CEC peripheral receives messages addressed to its own address (OAR) with positive acknowledge. Messages addressed to different destination are received, but without interfering with the CEC bus: no acknowledge sent.

Bits 30:16 **OAR[14:0]**: Own addresses configuration

The OAR bits are set by software to select which destination logical addresses has to be considered in receive mode. Each bit, when set, enables the CEC logical address identified by the given bit position.

At the end of HEADER reception, the received destination address is compared with the enabled addresses. In case of matching address, the incoming message is acknowledged and received. In case of non-matching address, the incoming message is received only in listen mode (LSTN = 1), but without acknowledge sent. Broadcast messages are always received.

Example:

OAR = 0b000 0000 0010 0001 means that CEC acknowledges addresses 0x0 and 0x5.

Consequently, each message directed to one of these addresses is received.

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **SFTOP**: SFT option bit

The SFTOPT bit is set and cleared by software.

0: SFT timer starts when TXSOM is set by software.

1: SFT timer starts automatically at the end of message transmission/reception.

- Bit 7 **BRDNOGEN**: Avoid error-bit generation in broadcast  
 The BRDNOGEN bit is set and cleared by software.  
 0: BRE detection with BRESTP = 1 and BREGEN = 0 on a broadcast message generates an error-bit on the CEC line. LBPE detection with LBPEGEN = 0 on a broadcast message generates an error-bit on the CEC line.  
 1: Error-bit is not generated in the same condition as above. An error-bit is not generated even in case of an SBPE detection in a broadcast message if listen mode is set.
- Bit 6 **LBPEGEN**: Generate error-bit on long bit period error  
 The LBPEGEN bit is set and cleared by software.  
 0: LBPE detection does not generate an error-bit on the CEC line.  
 1: LBPE detection generates an error-bit on the CEC line.  
*Note: If BRDNOGEN = 0, an error-bit is generated upon LBPE detection in broadcast even if LBPEGEN = 0.*
- Bit 5 **BREGEN**: Generate error-bit on bit rising error  
 The BREGEN bit is set and cleared by software.  
 0: BRE detection does not generate an error-bit on the CEC line.  
 1: BRE detection generates an error-bit on the CEC line (if BRESTP is set).  
*Note: If BRDNOGEN = 0, an error-bit is generated upon BRE detection with BRESTP = 1 in broadcast even if BREGEN = 0.*
- Bit 4 **BRESTP**: Rx-stop on bit rising error  
 The BRESTP bit is set and cleared by software.  
 0: BRE detection does not stop reception of the CEC message. Data bit is sampled at 1.05 ms.  
 1: BRE detection stops message reception.
- Bit 3 **RXTOL**: Rx-tolerance  
 The RXTOL bit is set and cleared by software.  
 0: Standard tolerance margin:  
 – Start-bit, +/- 200  $\mu$ s rise, +/- 200  $\mu$ s fall  
 – Data-bit: +/- 200  $\mu$ s rise. +/- 350  $\mu$ s fall  
 1: Extended tolerance  
 – Start-bit: +/- 400  $\mu$ s rise, +/- 400  $\mu$ s fall  
 – Data-bit: +/-300  $\mu$ s rise, +/- 500  $\mu$ s fall
- Bits 2:0 **SFT[2:0]**: Signal free time  
 SFT bits are set by software. In the SFT = 0x0 configuration, the number of nominal data bit periods waited before transmission is ruled by hardware according to the transmission history. In all the other configurations the SFT number is determined by software.  
 0x0  
 – 2.5 data-bit periods if CEC is the last bus initiator with unsuccessful transmission (ARBLST = 1, TXERR = 1, TXUDR = 1 or TXACKE = 1)  
 – 4 data-bit periods if CEC is the new bus initiator  
 – 6 data-bit periods if CEC is the last bus initiator with successful transmission (TXEOM = 1)  
 0x1: 0.5 nominal data bit periods  
 0x2: 1.5 nominal data bit periods  
 0x3: 2.5 nominal data bit periods  
 0x4: 3.5 nominal data bit periods  
 0x5: 4.5 nominal data bit periods  
 0x6: 5.5 nominal data bit periods  
 0x7: 6.5 nominal data bit periods

### 63.7.3 CEC Tx data register (CEC\_TXDR)

Address offset: 0x8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TXD[7:0]							
								w	w	w	w	w	w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **TXD[7:0]**: Tx data

TXD is a write-only register containing the data byte to be transmitted.

### 63.7.4 CEC Rx data register (CEC\_RXDR)

Address offset: 0xC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RXD[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **RXD[7:0]**: Rx data

RXD is read-only and contains the last data byte that has been received from the CEC line.

### 63.7.5 CEC interrupt and status register (CEC\_ISR)

Address offset: 0x10

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	TX ACKE	TX ERR	TX UDR	TX END	TXBR	ARB LST	RX ACKE	LBPE	SBPE	BRE	RX OVR	RX END	RXBR
			rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **TXACKE**: Tx-missing acknowledge error

In transmission mode, TXACKE is set by hardware to inform application that no acknowledge was received. In case of broadcast transmission, TXACKE informs application that a negative acknowledge was received. TXACKE aborts message transmission and clears TXSOM and TXEOM controls.

TXACKE is cleared by software write at 1.

Bit 11 **TXERR**: Tx-error

In transmission mode, TXERR is set by hardware if the CEC initiator detects low impedance on the CEC line while it is released. TXERR aborts message transmission and clears TXSOM and TXEOM controls.

TXERR is cleared by software write at 1.

Bit 10 **TXUDR**: Tx-buffer underrun

In transmission mode, TXUDR is set by hardware if application was not in time to load TXDR before of next byte transmission. TXUDR aborts message transmission and clears TXSOM and TXEOM control bits.

TXUDR is cleared by software write at 1

Bit 9 **TXEND**: End of transmission

TXEND is set by hardware to inform application that the last byte of the CEC message has been successfully transmitted. TXEND clears the TXSOM and TXEOM control bits.

TXEND is cleared by software write at 1.

Bit 8 **TXBR**: Tx-byte request

TXBR is set by hardware to inform application that the next transmission data has to be written to TXDR. TXBR is set when the 4th bit of currently transmitted byte is sent. Application must write the next byte to TXDR within six nominal data-bit periods before transmission underrun error occurs (TXUDR).

TXBR is cleared by software write at 1.

Bit 7 **ARBLST**: Arbitration lost

ARBLST is set by hardware to inform application that CEC device is switching to reception due to arbitration lost event following the TXSOM command. ARBLST can be due either to a contending CEC device starting earlier or starting at the same time but with higher HEADER priority. After ARBLST assertion TXSOM bit keeps pending for next transmission attempt.

ARBLST is cleared by software write at 1.

Bit 6 **RXACKE**: Rx-missing acknowledge

In receive mode, RXACKE is set by hardware to inform application that no acknowledge was seen on the CEC line. RXACKE applies only for broadcast messages and in listen mode also for not directly addressed messages (destination address not enabled in OAR). RXACKE aborts message reception.

RXACKE is cleared by software write at 1.

Bit 5 **LBPE**: Rx-long bit period error

LBPE is set by hardware in case a data-bit waveform is detected with long bit period error. LBPE is set at the end of the maximum bit-extension tolerance allowed by RXTOL, in case falling edge is still longing. LBPE always stops reception of the CEC message. LBPE generates an error-bit on the CEC line if LBPEGEN = 1. In case of broadcast, error-bit is generated even in case of LBPEGEN = 0.

LBPE is cleared by software write at 1.

Bit 4 **SBPE**: Rx-short bit period error

SBPE is set by hardware in case a data-bit waveform is detected with short bit period error. SBPE is set at the time the anticipated falling edge occurs. SBPE generates an error-bit on the CEC line. SBPE is cleared by software write at 1.

Bit 3 **BRE**: Rx-bit rising error

BRE is set by hardware in case a data-bit waveform is detected with bit rising error. BRE is set either at the time the misplaced rising edge occurs, or at the end of the maximum BRE tolerance allowed by RXTOL, in case rising edge is still longing. BRE stops message reception if BRESTOP = 1. BRE generates an error-bit on the CEC line if BREGEN = 1. BRE is cleared by software write at 1.

Bit 2 **RXOVR**: Rx-overflow

RXOVR is set by hardware if RXBR is not yet cleared at the time a new byte is received on the CEC line and stored into RXD. RXOVR assertion stops message reception so that no acknowledge is sent. In case of broadcast, a negative acknowledge is sent. RXOVR is cleared by software write at 1.

Bit 1 **RXEND**: End of reception

RXEND is set by hardware to inform application that the last byte of a CEC message is received from the CEC line and stored into the RXD buffer. RXEND is set at the same time of RXBR. RXEND is cleared by software write at 1.

Bit 0 **RXBR**: Rx-byte received

The RXBR bit is set by hardware to inform application that a new byte has been received from the CEC line and stored into the RXD buffer. RXBR is cleared by software write at 1.

### 63.7.6 CEC interrupt enable register (CEC\_IER)

Address offset: 0x14

Reset value: 0x0000 0000

**Caution:** It is mandatory to write CEC\_IER only when CECEN = 0.

Refer to [Section 2.3](#) for the register boundary addresses.

## 64 Debug infrastructure

### 64.1 Introduction

The debug infrastructure allows software designers to debug and trace their embedded software.

The debug features can be controlled via a JTAG/serial-wire debug (SWD) access port, using industry standard debugging tools. A trace port allows data to be captured for logging and analysis.

The trace and debug system has been designed to support a variety of typical use cases:

- **Low cost trace**

Limited trace capability is available over the single-wire debug output. This supports code instrumentation using “printf”, tracing of data and address watchpoints, interrupt detection and program counter sampling. Single-wire trace can be maintained even when the processor is switched off or clock-stopped.
- **Breakpoint debugging**

The processor can be debugged using equipment connected to the JTAG/SWD port. This allows breakpoint and watchpoint setting, code stepping, memory access.
- **Tracing code execution via the trace port**

Trace information is combined into a single trace stream and output to a trace port analyzer in real time. An ID embedded in the trace allows the analyzer to identify the source of information packet.
- **Capturing trace continuously in a circular buffer**

Instead of streaming it off-chip, the combined trace information can be stored on-chip in a circular buffer. The trace storage can be started and stopped by a debugger command, a software command, an external trigger signal or an internal event for example.
- **Draining the buffer to the trace port**

The stored trace can be dumped off-chip to the trace port analyzer. The buffer draining can be initiated by the debugger, the software, an external trigger or an internal event for example.
- **Reading the buffer with the debugger**

The debugger can read the content of the trace buffer via the debug port. This is slower than the trace port but allows basic trace functionality on the debugger without the cost of a trace port analyzer.
- **Analyzing stored trace in software**

The trace buffer can be either read by the processor core, or transferred into the system memory by DMA. This powerful feature allows built-in test software to monitor code execution in real time, to analyze and identify faults or to autonomously handle exceptions.
- **Uploading stored trace**

The stored trace can also be uploaded to a host machine using one of the MCU communication interfaces (such as USB, USART, SPI, I2C, Ethernet, CAN). This is especially useful if the trace port is not accessible, for example remote monitoring and failure analysis of a deployed product.

## 64.2 Debug infrastructure features

A comprehensive set of trace and debug features is provided to support software development and system integration:

- Breakpoint debugging
- Code execution tracing
- Software instrumentation
- Cross-triggering
- JTAG debug port
- Serial-wire debug (SWD) port
- Trigger input and output
- Serial-wire trace port
- Trace port
- Arm<sup>®</sup> CoreSight<sup>™</sup> debug and trace components

The CoreSight components are described at high level in this document:

- SWJ-DP: JTAG/Serial-wire debug port
- AXI-AP: AXI access port
- AHB-AP: AHB access port
- APB-AP: APB access port
- ITM: instrumentation trace macrocell
- DWT: data watchpoint and trace
- ETM: embedded trace macrocell
- ETF: embedded trace FIFO
- TPIU: trace port interface unit
- SWO: serial-wire output
- CTI: cross trigger interface
- CSTF: trace bus funnel

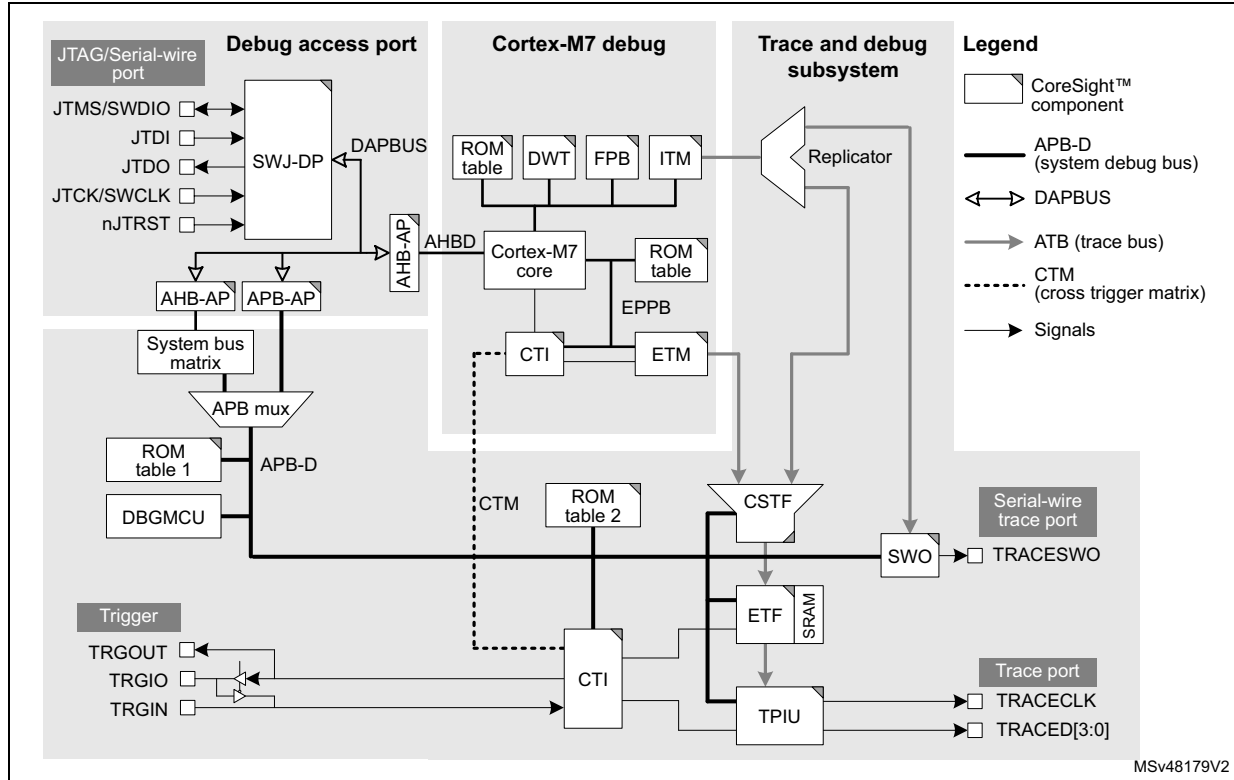

Detailed information is available in the Arm documents referenced in [Section 64.7](#).

### 64.3 Debug infrastructure functional description

#### 64.3.1 Debug infrastructure block diagram

The block diagram shows the logical partitioning of the debug infrastructure.

Figure 760. Block diagram of debug infrastructure

#### 64.3.2 Debug infrastructure pins and internal signals

Table 517. JTAG/Serial-wire debug port pins

Pin name	JTAG debug port		Serial-wire debug port		Pin assignment
	Type	Description	Type	Description	
JTMS/SWDIO	I	JTAG test mode select	IO	Serial-wire data in/out	PA13
JTCK/SWCLK	I	JTAG test clock	I	Serial-wire clock	PA14
JTDI	I	JTAG test data input	-	-	PA15
JTDO	O	JTAG test data output	-	-	PB3
nJTRST	I	JTAG test reset	-	-	PB4

**Table 518. Trace port pins**

Pin name	Type	Description	Pin assignment
TRACED0	O	Trace synchronous data out 0	Refer to datasheet
TRACED1	O	Trace synchronous data out 1	
TRACED2	O	Trace synchronous data out 2	
TRACED3	O	Trace synchronous data out 3	
TRACECLK	O	Trace clock	

**Table 519. Serial-wire trace port pins**

Pin name	Type	Description	Pin assignment
TRACESWO	O	Single wire trace asynchronous data out	PB3 <sup>(1)</sup>

1. TRACESWO is multiplexed with JTDO. This means that single-wire trace is only available when using the serial-wire debug interface, not when using JTAG.

**Table 520. Trigger pins**

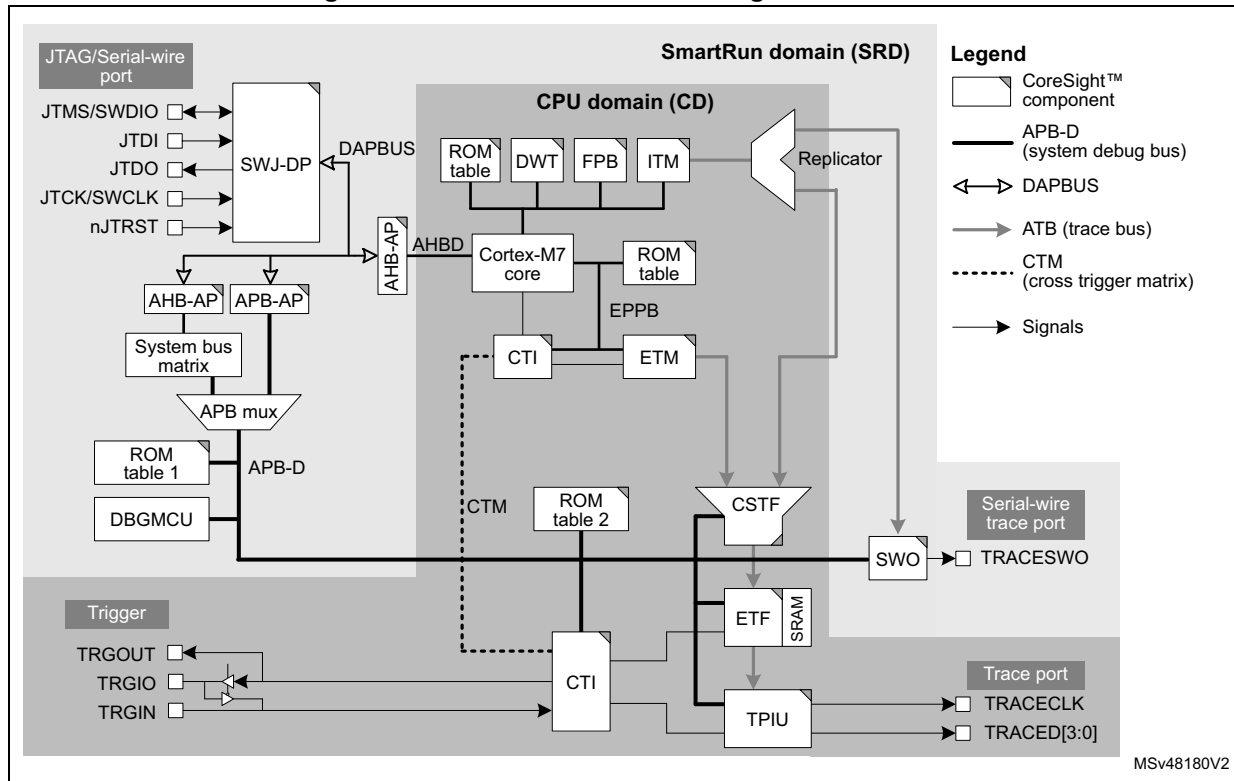

Pin name	Type	Description	Pin assignment
TRGIN	I	External trigger input	Refer to datasheet
TRGOUT	O	External trigger output	
TRGIO	IO	External trigger bi-directional <sup>(1)</sup>	

1. TRGIO can be configured as an input or an output by the TRGOEN bit in the MCU debug unit (DBGMCU). If configured as an input, it is connected to TRGIN. If configured as an output, it is connected to TRGOUT. This is because TRGIN and TRGOUT are not available on certain packages.

### 64.3.3 Debug infrastructure powering, clocking and reset

#### Power domains

Figure 761. Power domains of debug infrastructure

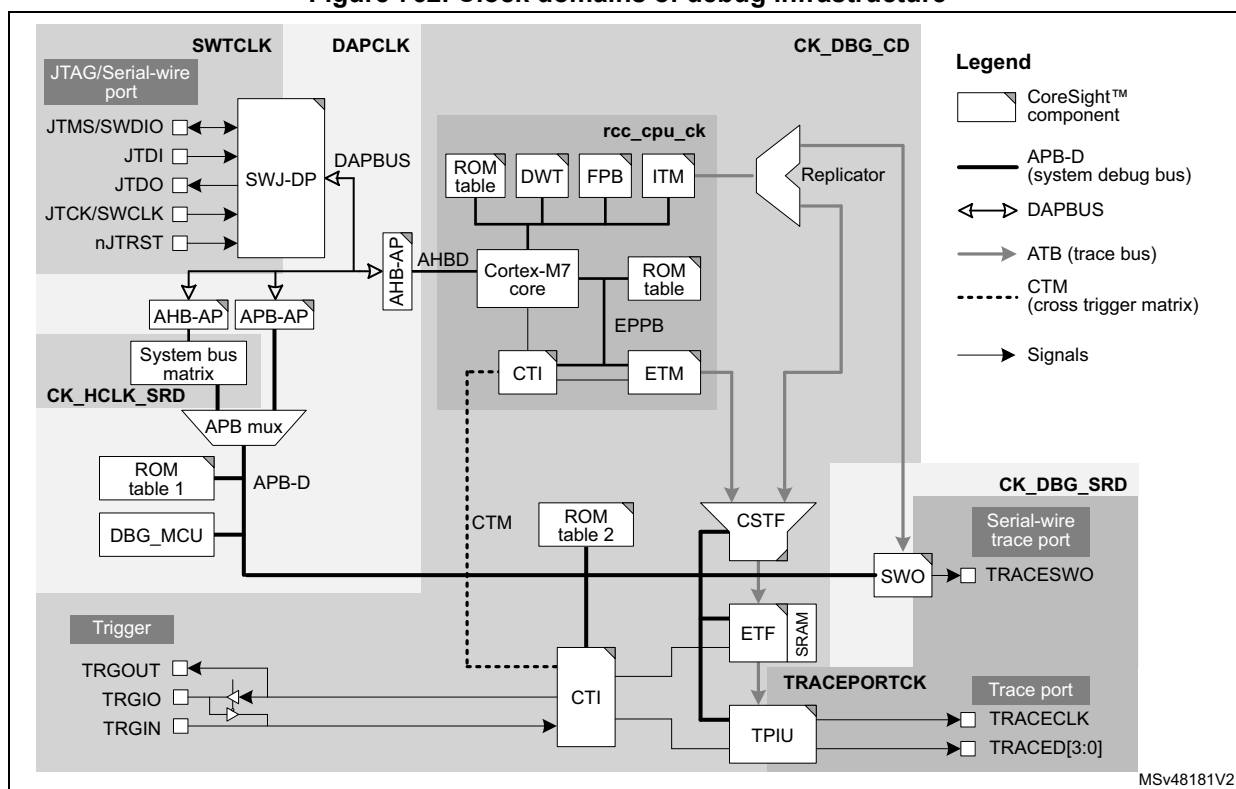

The debug components are distributed across the power CPU domain (CD) and SmartRun domain (SRD). The SmartRun power domain must be always on when the debugger is connected. It therefore contains the SWJ-DP, so that the debugger does not lose the connection with the SoC when the CPU power domain is switched off. In addition, it contains the MCU debug unit (DBGMCU) and the serial-wire trace features.

The CPU power domain contains the Cortex-M7 core and the associated debug and trace components. It also contains the system trace components located on the APB-D. This power domain therefore needs to be on whenever a debug access to the Cortex-M7 is required or whenever a trace functionality is active on the processor.

**Clock domains**

**Figure 762. Clock domains of debug infrastructure**

The debugger supplies the clock for the debug port, SWCLK, via the debug interface pin JTCK/SWCLK. This clock is used to register the serial input data in both Serial-wire and JTAG modes, as well as to operate the state machines and internal logic of the debug port. It must therefore continue to toggle for several cycles after the end of an access, to ensure that the debug port returns to the idle state.

The SWJ-DP contains an asynchronous interface to the DAPCLK domain, which covers the rest of the SWJ-DP and the access ports. The DBGMCU and a ROM table are also in the DAPCLK domain.

CK\_DBG\_SRD clocks the SWO.

Both DAPCLK and CK\_DBG\_SRD are gated versions of the SmartRun domain system clock (rcc\_fclk\_srd).

CK\_DBG\_CD clocks the trace components in the CPU power domain: a ROM table, CoreSight trace funnel, ETF, system CTI, TPIU, as well as the ATB trace bus. It is a gated version of the CPU domain system clock (rcc\_aclk).

TRACEPORTCK clocks the trace port interfaces (TRACECLK, TRACED1 to 4 and TRACESWO). It is selected through SW[2:0] bitfield of RCC\_CFGR register.

All the debug clocks (except DAPCLK) can be enabled and disabled by register bits in the DBGMCU. The DAPCLK domain is enabled by the debugger using the CDBGPWRUPREQ bit in the debug port CTRL/STAT register. The clock must be enabled before the debugger can access any of the debug features on the device. It must be disabled at power up and when the debugger is disconnected, to avoid wasting energy.

The debug and trace components included in the processor (such as ETM, ITM, DWG, FPB) are clocked with the CPU clock (`rcc_cpu_ck`).

### Debug with low-power modes

The device includes power-saving features allowing individual power domains to be switched off or stopped when not required. If a power domain is switched off or not clocked, all debug components in that domain are inaccessible to the debugger. To avoid this, power saving mode emulation is implemented. If the emulation is enabled for a domain, the domain still enters power saving mode but its clock and power are maintained. In other words, the domain behaves as if it is in power saving mode while the debugger does not lose the connection.

The emulation mode is programmed in the DBGMCU. For more information, refer to [Section 64.5.7](#).

### Reset of debug infrastructure

The debug components, except for the debug and access ports, are reset by their respective power domain resets. The debug port (SWJ-DP) is reset by a power-on reset of the SmartRun domain only.

## 64.4 Debug access port functional description

The debug access port (DAP) is a debug subsystem comprising Serial-wire and JTAG debug port (SWJ-DP) and three access ports.

### 64.4.1 Serial-wire and JTAG debug port (SWJ-DP)

The SWJ-DP is a CoreSight component that implements an external access port for connecting debugging equipment.

The port can be configured as:

- a 5-pin standard JTAG debug port (JTAG-DP)
- a 2-pin (clock + data) Serial-wire debug port (SW-DP)

The two modes are mutually exclusive, since they share the same I/O pins.

By default, the JTAG-DP is selected upon a system or power-on reset. The five I/Os are configured by hardware in debug alternative function mode. The SWJ-DP incorporates pull-up resistors on the JTDI, JTMS/SWDIO and nJTRST lines, as well as a pull-down resistor on the JTCK/SWCLK line.

A debugger can select the SW-DP by transmitting the following serial data sequence on JTMS/SWDIO:

..., (50 or more), ..., 0, 1, 1, 1, 1, 0, 0, 1, 1, 1, 1, 0, 0, 1, 1, 1, ..., (50 or more), ...

JTCK/SWCLK must be cycled for each data bit.

In SW-DP mode, the unused JTAG lines JTDI, JTDO and nJTRST can be used for other functions.

All SWJ port I/Os can be reconfigured to other functions by software. In that case, debugging is no longer possible.

### Serial-wire debug port

The Serial-wire debug protocol uses two pins:

- SWCLK: clock from host to target
- SWDIO: bi-directional serial data (100 kΩ pull-up required)

Serial data is transferred LSB first, synchronously with the clock. A transfer comprises three phases:

1. packet request (8 bits) transmitted by the host
2. acknowledge response (3 bits) transmitted by the target
3. data transfer (33 bits) transmitted by the host (in case of a write) or target (in case of a read)

The data transfer only occurs if the acknowledge response is OK.

Between each phase, if the direction of the data is reversed, a single clock cycle turn-around time is inserted.

**Table 521. Packet request**

Bit field	Name	Description
0	Start	Must be 1
1	APnDP	0: DP register access - see <a href="#">Table 525</a> for a list of DP registers 1: AP register access - see <a href="#">Section 64.4.2</a>
2	RnW	0: Write request 1: Read request
4:3	A(3:2)	Address field of the DP or AP register (refer to <a href="#">Table 525</a> and <a href="#">Table 526</a> )
5	Parity	Single bit parity of preceding bits
6	Stop	0
7	Park	Not driven by host. Must be read as 1 by target.

**Table 522. ACK response**

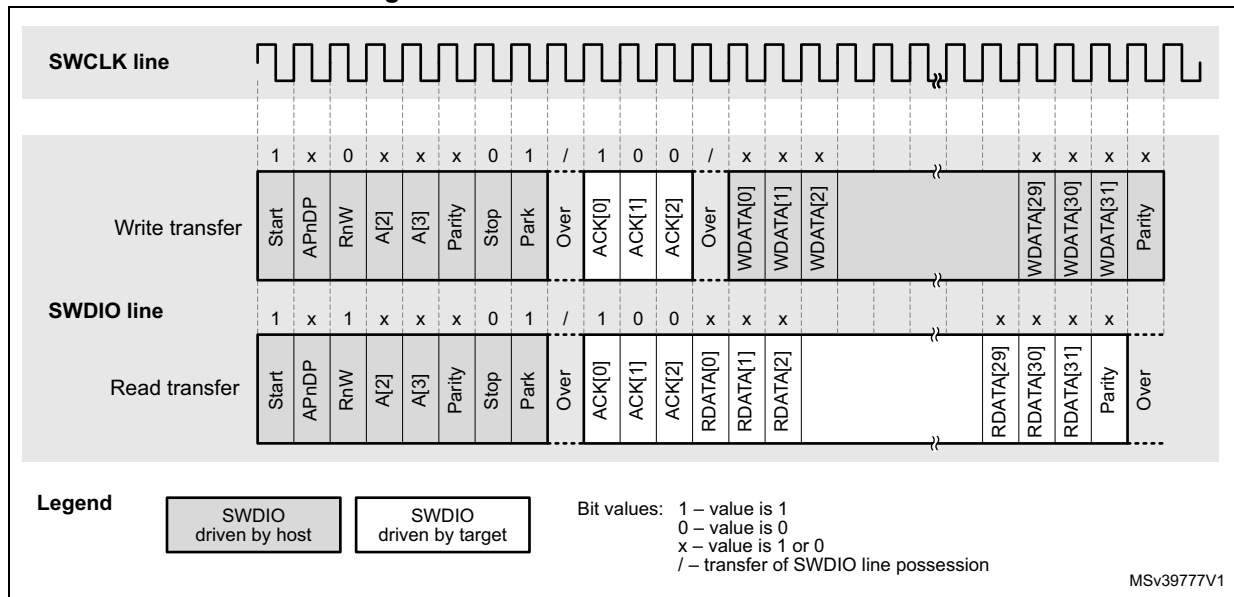

Bit field	Name	Description
2:0	ACK	000b: FAULT 010b: WAIT 100b: OK

**Table 523. Data transfer**

Bit field	Name	Description
31:0	WDATA or RDATA	Write or Read data
32	Parity	Single bit parity of 32 data bits

The figure below shows successful write and read transfers.

**Figure 763. SWD successful data transfer**

In the case of a FAULT or WAIT ACK response from the target, the data transfer phase is canceled, unless overrun detection is enabled. In this case the data are ignored by the target (in case of a write), or not driven (in case of a read).

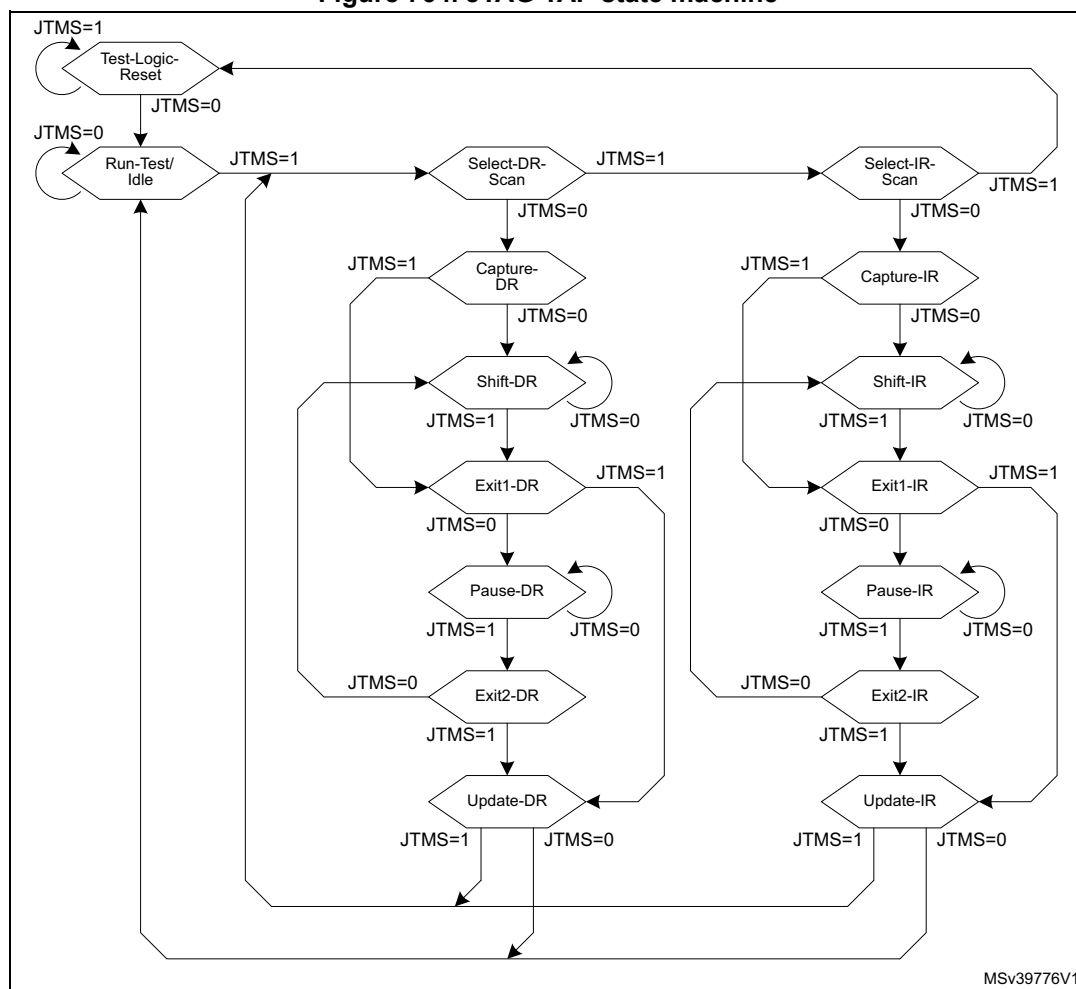

A line reset must be generated by the host when it is first connected, or following a protocol error. The line reset consists of 50 or more SWCLK cycles with SWDIO high, followed by two SWCLK cycles with SWDIO low.

For more details on the Serial-wire debug protocol, refer to the Arm Debug Interface Architecture Specification [1].

*Note:* The SWJ-DP implements SWD protocol version 2.

JTAG debug port

Figure 764. JTAG TAP state machine

The JTAG-DP implements a TAP state machine (TAPSM) based on IEEE 1149.1-1990. The state machine is shown in the previous figure. It controls two scan chains, one associated with an instruction register (IR) and one with a number of data registers (DR).

When the TAPSM goes through the Capture-IR state, 0b0001 is transferred onto the instruction register (IR) scan chain. The IR scan chain is connected between JTDI and JTDO.

While the TAPSM is in the Shift-IR state, the IR scan chain shifts one bit for each rising edge of JTCK. This means that on the first tick:

- The LSB of the IR scan chain is output on JTDO.
- Bit [n] of the IR scan chain is transferred to bit [n-1].
- The value on JTDI is transferred to the MSB of the IR scan chain.

When the TAPSM goes through the Update-IR state, the value scanned into the IR scan chain is transferred into the instruction register.

When the TAPSM goes through the Capture-DR state, a value is transferred from one of the data registers onto one of the DR scan chains, connected between JTDI and JTDO.

The value held in the instruction register determines which data register and associated DR scan chain are selected.

This data is then shifted while the TAPSM is in the Shift-DR state, in the same manner as the IR shifts in the Shift-IR state.

When the TAPSM goes through the Update-DR state, the value scanned into the DR scan chain is transferred into the selected data register.

When the TAPSM is in the Run-Test/Idle state, no special actions occur. The IDCODE instruction is loaded in IR.

When active, the nJTRST signal resets the state machine asynchronously to the Test-Logic-Reset state.

The data registers corresponding to the 4-bit IR instructions are listed in the table below.

**Table 524. JTAG-DP data registers**

Instruction register	Data register	Scan chain length	Description
0000 to 0111	(BYPASS)	1	Not implemented: BYPASS selected
1000	ABORT	35	<b>Abort register</b> – Bits 31:1 = reserved – Bit 0 = APABORT: write 1 to generate an AP abort
1001	(BYPASS)	1	Reserved: BYPASS selected
1010	DPACC	35	<b>Debug port access register</b> Initiates the debug port and allows access to a debug port register. – When transferring data IN: Bits 34:3 = DATA[31:0] = 32-bit data to transfer for a write request Bits 2:1 = A[3:2] = 2-bit address of a debug port register Bit 0 = RnW = Read request (1) or write request (0) – When transferring data OUT: Bits 34:3 = DATA[31:0] = 32-bit data read following a read request Bits 2:0 = ACK[2:0] = 3-bit Acknowledge 010 = OK/FAULT 001 = WAIT Other = reserved
1011	APACC	35	<b>Access port access register</b> Initiates an access port and allows access to an access port register. – When transferring data IN: Bits 34:3 = DATA[31:0] = 32-bit data to shift in for a write request Bits 2:1 = A[3:2] = 2-bit sub-address of an access port register Bit 0 = RnW= Read request (1) or write request (0) – When transferring data OUT: Bits 34:3 = DATA[31:0] = 32-bit data read following a read request Bits 2:0 = ACK[2:0] = 3-bit Acknowledge: 010 = OK/FAULT 001 = WAIT Other = reserved
1100	(BYPASS)	1	Reserved: BYPASS selected

Table 524. JTAG-DP data registers (continued)

Instruction register	Data register	Scan chain length	Description
1101	(BYPASS)	1	Reserved: BYPASS selected
1110	IDCODE	32	<b>ID code</b> 0x6BA0 0477: Arm JTAG debug port ID code
1111	BYPASS	1	<b>Bypass</b> A single JTCK cycle delay is inserted between JTDI and JTDO

The DR registers are described in more detail in the Arm Debug Interface Architecture Specification [1].

### Debug port registers

The SW-DP and JTAG-DP both access the debug port (DP) registers. These are listed in the table below.

The debugger can access the DP registers as follows:

1. Program the SELECT register DPBANKSEL field in the DP to select the register bank to be accessed.
2. Program the A[3:2] field in the DPACC register, if using JTAG, with the register address within the bank. Program the R/W bit to select a read or a write. In case of a write, program the DATA field with the write data. If using SWD, the A(3:2) and R/W fields are part of the packet request word sent to the SW-DP with the APnDP bit reset (see Table 521). The write data is sent in the data phase.

Table 525. Debug port registers

Address	A[3:2] field value	R/W	Description
0x0	00	R	DP_DPIDR register <sup>(2)</sup> . It contains the IDCODE for the debug port.
		W	DP_ABORT register <sup>(1)</sup> . It aborts the current AP transaction. This register is also used to clear the error flags in the DP_CTRL/STAT register.
0x4	01	R/W	If DPBANKSEL[3:0] = 0x0 (DP_SELECT register): CTRL/STAT register. It controls the DP and provides status information.
			If DPBANKSEL[3:0] = 0x1 (DP_SELECT register): DP_DLCR register <sup>(2)</sup> . It controls the operating mode of the SWD data link.
			If DPBANKSEL[3:0] = 0x2 (DP_SELECT register): DP_TARGETID register. It provides target identification information.
			If DPBANKSEL[3:0] = 0x3 (DP_SELECT register): DLPIDR register <sup>(2)</sup> . It provides the SWD protocol version.
0x8	10	R	RESEND register <sup>(2)</sup> . It returns the value that was returned by the last AP read or DP_RDBUFF read, used in the event of a corrupted read transfer.
		W	DP_SELECT register. It selects the access port, access port register bank, and DP register at address 0x4.

**Table 525. Debug port registers (continued)**

Address	A[3:2] field value	R/W	Description
0xC	11	R	DP_RDBUFF register Via JTAG-DP, it is used to allow the debugger to get the final result after a sequence of operations (without requesting new JTAG-DP operation). Via SW-DP, it contains the result of the preceding AP read access, allowing a new AP access to be avoided.
		W	DP_TARGETSEL register <sup>(2)</sup> . On a write to DP_TARGETSEL immediately following a line reset sequence, the target is selected if the following conditions are both met: – Bits [31:28] match bits [31:28] in the DP_DLPIDR register. – Bits [27:0] match bits [27:0] in the DP_TARGETID register. Writing any other value deselects the target. Debug tools must write 0xFFFFFFFF to deselect all targets. This is an invalid DP_TARGETID value. All other invalid DP_TARGETID values are reserved.

1. Access to the AP ABORT register from the JTAG-DP is done using the ABORT instruction.
2. Only accessible via SW-DP. Register is “reserved” via JTAG-DP.

**Debug port identification register (DP\_DPIDR)**

Address offset: 0x0

 1: STICKYERR bit cleared in CTRL/STAT register

Bit 1 **STKMPCLR**: sticky compare clear bit  
 0: no effect  
 1: STICKYCMP bit cleared in CTRL/STAT register

Bit 0 **DAPABORT**: abort current AP transaction  
 The transaction is aborted if an excessive number of WAIT responses are returned, indicating that the transaction has stalled.  
 0: no effect  
 1: transaction aborted

**Debug port control/status register (DP\_CTRL/STAT)**

Address offset: 0x4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	r	r	rw	w	w	w	w	w

- Bit 31 **CSYSPWRUPACK**: system domain power-up status bit - not used in this device
- Bit 30 **CSYSPWRUPREQ**: system domain power-up control bit - not used in this device
- Bit 29 **CDBGPWRUPACK**: debug domain power-up status bit  
 This bit is read-only. It returns the status of the debug domain power-up acknowledge signal from the power controller.  
 0: domain powered down  
 1: domain powered up
- Bit 28 **CDBGPWRUPREQ**: debug domain power-up/down control bit  
 This bit controls the debug domain power-up/down request signal to the power controller.  
 0: power-down requested  
 1: power-up requested
- Bit 27 **CDBGGRSTACK**: debug domain reset status bit - not used in this device
- Bit 26 **CDBGGRSTREQ**: debug domain reset control bit - not used in this device
- Bits 25:24 Reserved, must be kept at reset value.
- Bits 23:12 **TRNCNT[11:0]**: transaction counter  
 To program a sequence of transactions to incremental addresses via an AP, TRNCNT bits are loaded with the number of transactions to perform. It is decremented at the successful completion of each transaction.
- Bits 11:8 **MASKLANE[3:0]**: pushed-compare and pushed-verify masking bits  
 The field indicates the bytes to be masked in pushed-compare and pushed-verify operations (DP\_CTRL/STAT register's field TRNMODE = 1 or 2). In the pushed operations, the word supplied in an AP write transaction is compared with the current value at the target AP address.  
 1xxx include byte lane 3 in comparisons  
 x1xx: include byte lane 2 in comparisons  
 xx1xX: include byte lane 1 in comparisons  
 xxx1: include byte lane 0 in comparisons

**Bit 7 WDATAERR:** write data error in SW-DP

The bit indicates that:

- There is a parity or a framing error on the data phase of a write operation
- A write operation that has been accepted by the DP, has then be discarded without being submitted to the AP.

This bit is read-only. It is reset by writing 1 to the WDERRCLR bit of the DP\_ABORT register.

0: no error

1: an error occurred

This bit is reserved in JTAG-DP.

**Bit 6 READOK:** AP read response in SW-DP

This bit indicates the response to the last AP read access. It is read-only.

0: Read not OK

1: Read OK

This bit is reserved in JTAG-DP.

**Bit 5 STICKYERR:** transaction error (read-only in SW-DP, R/W in JTAG-DP)

This bit indicates that an error occurred during an AP transaction.

0: no error

1: an error occurred

In the SW-DP, this bit is reset by writing 1 to the STKERRCLR bit of the DP\_ABORT register.

In the JTAG-DP, this bit is reset by programming it to 1.

**Bit 4 STICKYCMP:** compare match (read-only in SW-DP, R/W in JTAG-DP)

This bit indicates that a match occurred in a pushed operation.

0: match if TRNMODE = 0x1; no match if TRNMODE = 0x2

1: no match if TRNMODE = 0x1; match if TRNMODE = 0x2

In the SW-DP, this bit is reset by writing 1 to the STKCMPCLR bit in the DP\_ABORT register.

In the JTAG-DP, this bit is reset by programming it to it.

**Bits 3:2 TRNMODE[1:0]:** transfer mode for AP write operations

For read operations, this field must be set to 0x0.

0x0: normal operation. AP transactions are passed directly to the AP.

0x1: pushed-verify operation.

The DP stores the write data and performs a read transaction at the target AP address. The result of the read operation is compared with the stored data. If they do not match, the STICKYCMP bit is set.

0x2: pushed-compare operation.

The DP stores the write data and performs a read transaction at the target AP address. The result of the read is compared with the stored data. If they match, the STICKYCMP bit is set.

0x3: reserved

In pushed operations, only the data bytes indicated by the MASKLANE field are included in the comparison.

**Bit 1 STICKYORUN:** overrun (read-only in SW-DP, R/W in JTAG-DP)

This bit indicates that an overrun occurred (new transaction received before previous transaction completed). This bit is only set if the ORUNDETECT bit is set.

0: no overrun

1: an overrun occurred

In the SW-DP, this bit is reset by writing 1 to the ABORT register's ORUNERRCLR bit. In the JTAG-DP, this bit is reset by writing a 1 to it.

Bit 0 **ORUNDETECT**: overrun detection mode enable

0: overrun detection disabled

1: overrun detection enabled.

In the event of an overrun, the STICKYORUN bit is set and subsequent transactions are blocked until the STICKYORUN bit is cleared.

**Debug port data link control register (DP\_DLCR)**

Address offset: 0x4

Reset value: 0x0000 0040

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	APBANKSEL[3:0]				DPBANKSEL[3:0]			
								w	w	w	w	w	w	w	w

Bits 31:28 **APSEL[3:0]**: access port select bits

These bits select the access port for the next transaction.

0x0: AP0 - Cortex-M7 debug access port (AHB-AP)

0x1: AP1 - SRD access port (AHB-AP)

0x2: AP2 - system debug access port (APB-AP)

0x3 to 0xF: reserved

Bits 27:8 Reserved, must be kept at reset value.

Bits 7:4 **APBANKSEL[3:0]**: AP register bank select bits

These bits select the 4-word register bank on the active AP for the next transaction.

Bits 3:0 **DPBANKSEL[3:0]**: DP register bank select bits

These bits select the register at address 0x4 of the debug port.

0x0: CTRL/STAT register

0x1: DLCR register

0x2: TARGETID register

0x3: DLPIDR register

0x4 to 0xF: reserved

### Debug port read buffer register (DP\_RDBUFF)

Address offset: 0xC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RDBUFF[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RDBUFF[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RDBUFF[31:0]**: last AP read value

The field contains the value returned by the last AP read access. There are two ways to retrieve the value returned by an AP read access:

- Perform a second read access to the same address, it initiates a new transaction on the corresponding bus.
- Read the value returned by the last AP read access from the DP\_RDBUFF register, in which case no new AP transaction occurs

### Debug port target identification register (DP\_TARGETSEL)

Address offset: 0xC

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TINSTANCE[3:0]				TPARTNO[15:4]											
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TPARTNO[3:0]				TDESIGNER[10:0]											Res.
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	

Bits 31:28 **TINSTANCE[3:0]**: target instance number

The field defines the instance number for the target device in a multi-drop system. It must be programmed with the same value as TINSTANCE field of DP\_DLPIR register, in order to select this device.

Bits 27:12 **TPARTNO[15:0]**: target part number

The field defines the part number for the target device. It must be programmed with the same value as TPARTNO field of DP\_TARGETID register, in order to select this device.

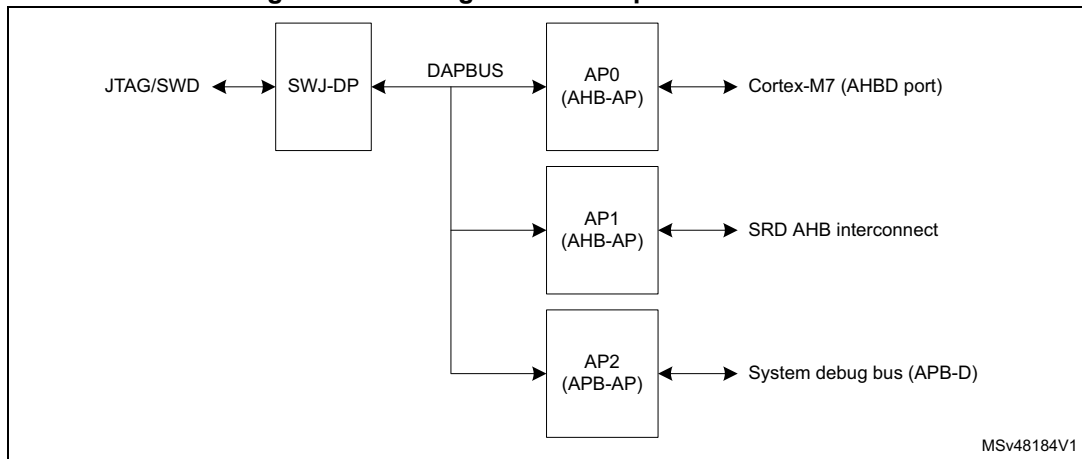

Bits 11:1 **TDESIGNER[10:0]**: target designer JEDEC code

The field defines the JEDEC code for the target device. It must be programmed with the same value as TDESIGNER field of DP\_TARGETID register, in order to select this device.

Bit 0 Reserved, must be kept at reset value.

### 64.4.2 Access ports

Figure 765. Debug and access port connections

The following access ports (AP) are attached to the DP:

1. AP0: Cortex-M7 access port (AHB-AP). Allows access to the debug and trace features integrated in the Cortex-M7 processor core via an AHB-Lite bus connected to the AHBD port of the processor.
2. AP1: SRD access port (AHB-AP). Allows access to the bus matrix in the SmartRun domain. This gives visibility of the SmartRun domain memory and peripherals when the CPU domain is switched off. No CoreSight components are accessible via this port.
3. AP2: System access port (APB-AP). Allows access to the debug and trace features on the system APB debug bus, that is, all components not included in the processor core.

All access ports are of MEM-AP type, that is, the debug and trace component registers, are mapped in the address space of the associated debug bus. The AP is seen by the debugger as a set of 32-bit registers organized in banks of four registers each. Some of these registers are used to configure or monitor the AP itself, while others are used to perform a transfer on the bus. The AP registers are listed in [Table 526](#).

The address of the AP registers is composed as follows:

- bits [7:4]: content of the APBANKSEL field in the DP\_SELECT register
- bits [3:2]: content of the A(3:2) field of the APACC data register in the JTAG-DP (see [Table 524](#)) or content of the SW-DP packet request (see [Table 521](#)), depending on the debug interface used
- bits [1:0]: always set to 0

The content of the APSEL field in DP\_SELECT register defines which MEM-AP is being accessed.

The debugger can access the AP registers as follows:

1. Program the APSEL field of the DP\_SELECT register to choose one of the APs, and program the APBANKSEL field to select the register bank to be accessed.
2. Program the A(3:2) field in the APACC register, if using JTAG, with the register address within the bank. Program the RnW bit to select a read or a write. In the case of a write, program the DATA field with the write data. If using SWD, the A(3:2) and RnW fields are part of the packet request word sent to the SW-DP with the APnDP bit set (see [Table 521](#)). The write data is sent in the data phase.

The debugger can access the memory mapped debug component registers through the MEM-AP registers (using the above AP register access procedure) as follows:

1. Program the transaction target address in the TAR register.
2. Program the CSW register, if necessary, with the transfer parameters (AddrInc for example).
3. Write to or read from the DRW register to initiate a bus transaction at the address held in the TAR register. Alternatively, a read or write to banked data register BDn triggers an access to address TAR[31:4] + n (this allows accessing up to four consecutive addresses without changing the address in the TAR register).

For more detailed information on the MEM-AP, refer to the Arm® Debug Interface Architecture Specification [1].

### MEM-AP registers

**Table 526. MEM-AP registers**

Address	APBANKSEL	A(3:2)	Name	Description
0x00	0x0	0	AP_CSW	Control/status word register
0x04	0x0	1	AP_TAR	Transfer address register Target address for the bus transaction.
0x08	-	-	-	Reserved
0x0C	0x0	3	AP_DRW	Data read/write register Access to this register triggers a corresponding transaction on the debug bus to the address in TAR[31:0].
0x10	0x1	0	AP_BD0	Banked data 0 register Access to this register triggers a corresponding transaction on the debug bus to the address in TAR[31:4] << 4 + 0x0.
0x14	0x1	1	AP_BD1	Banked data 1 register Access to this register triggers a corresponding transaction on the debug bus to the address in TAR[31:4] << 4 + 0x4.
0x18	0x1	2	AP_BD2	Banked data 2 register Access to this register triggers a corresponding transaction on the debug bus to the address in TAR[31:4] << 4 + 0x8.
0x1C	0x1	3	AP_BD3	Banked data 3 register Access to this register triggers a corresponding transaction on the debug bus to the address in TAR[31:4] << 4 + 0xC.
0x20-0xEC	-	-	-	Reserved
0xF0	-	-	-	Reserved
0xF4	-	-	-	Reserved
0xF8	0xF	2	AP_BASE	Debug base address register (RO) Base address of the ROM table
0xFC	0xF	3	AP_IDR	Identification register (RO)

**Access port control/status word register (AP\_CSW)**

Address offset: 0x0

Reset value: 0x0000 0002 (APB-AP), 0x4000 0002 (AHB-AP)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	SPROT	Res.	PROT[4:0]				SPISTATUS	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
	rw		rw	rw	rw	rw	rw	r							
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	MODE[3:0]			TRINPROG	DEVICEEN	ADDRINC[1:0]		Res.	SIZE[2:0]			
				rw	rw	rw	rw	r	r	rw	rw		rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bit 30 **SPROT**: secure transfer request bit

In the APB-AP, this field is reserved. In the AHB-APs, this field sets the protection attribute HPROT[6] of the bus transfer.

0: if SPIDEN is high, secure transfer., if SPIDEN is low, non-secure transfer  
 1: non-secure transfer

Bit 29 Reserved, must be kept at reset value.

Bits 28:24 **PROT[4:0]**: bus transfer protection bits

In the APB-AP, this field is reserved. In the AHB-APs, this field sets the protection attributes HPROT[4:0] of the bus transfer.

- xxxx0: instruction fetch
- xxxx1: data access
- xxx0x: user mode
- xxx1x: privileged mode
- xx0xx: non-bufferable
- xxX1xx: bufferable
- x0xxx: non-cacheable
- x1xxx: cacheable
- 0xxxx: non-exclusive
- 1xxxx: exclusive

Bit 23 **SPISTATUS**: status of SPIDEN option bit

This bit determines whether the debugger can access secure memory. This field is reserved in the APB-AP.

0: secure AHB transfers blocked  
 1: secure AHB transfers allowed

Bits 22:12 Reserved, must be kept at reset value.

Bits 11:8 **MODE[3:0]**: barrier support enabled bits

These bits define if the memory barrier operation is supported.  
 0x0: not supported

Bit 7 **TRINPROG**: transfer in progress

This bit indicates that a bus transfer is in progress on the AP.

0: no transfer in progress

1: bus transfer in progress

Bit 6 **DEVICEEN**: device enable bit

This bit defines whether the AP can be accessed or not.

1: AP access enabled.

Bits 5:4 **ADDRINC[1:0]**: auto-increment mode bits

These bits define whether the TAR address is automatically incremented after a transaction.

0x0: no auto-increment

0x1: address incremented by the size in bytes of the transaction (SIZE field)

0x2: packed transfers enabled (only in AHB-APs - reserved in APB-AP). A 32-bit AP access gives rise to 1 x 32-bit, 2 x 16-bit or 4 x 8-bit bus transactions, corresponding to the programmed transaction size. The data are packed or unpacked accordingly.

0x3: reserved

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **SIZE[2:0]**: size of next memory access transaction (only for AHB-APs)

0x0: byte (8-bit)

0x1: half-word (16-bit)

0x2: word (32-bit)

0x3-0x7: reserved

For APB-AP, this field is read-only and fixed at 0x2 (32-bit).

### Access port base address register (AP\_BASE)

Address offset: 0xF8

Reset value: 0xE00F E003 (AP0), 0x0000 0002 (AP1), 0xE00E 0003 (AP2)

BASEADDR[3:0]				Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FORMAT	ENTRYPRESENT
r	r	r	r											r	r

Bits 31:12 **BASEADDR[19:0]**: base address (bits 31 to 12) of ROM table for the AP  
 The 12 LSBs are zero since the ROM table must be aligned on a 4-Kbyte boundary.  
 AP0 (Cortex-M7 AHB-AP): 0xE00FE  
 AP1 (SRD AHB-AP): 0x00000 (no ROM table present)  
 AP2 (System APB-AP): 0xE00E0

Bits 11:2 Reserved, must be kept at reset value.

Bit 1 **FORMAT**: base address register format  
 1: Arm debug interface v5

Bit 0 **ENTRYPRESENT**: debug component present status bit  
 This bit indicates that debug components are present on the access port bus.  
 0: debug components not present (AP1)  
 1: debug components present (AP0, AP2)

### Access port identification register (AP\_IDR)

Address offset: 0xFC

Reset value: 0x8477 0001 (AP0 and AP1), 0x5477 0002 (AP2)

 0x8: r0p9 (AP0 and AP1)

Bits 27:24 **JEDEC BANK[3:0]**: JEDEC bank  
 0x4: Arm

Bits 23:17 **JEDEC CODE[6:0]**: JEDEC code  
 0x3B: Arm

Bit 16 **MEMAP**: memory access port  
 1: standard register map

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **IDENTITY[7:0]**: AP type identification  
 0x01: AHB-AP (AP0 and AP1)  
 0x02: APB-AP (AP2)  
 0x03-0xFF: reserved

## 64.5 Trace and debug subsystem functional description

The trace and debug subsystem features the following CoreSight components:

- System ROM tables
- System cross-trigger interface (CTI)
- Cross-trigger matrix (CTM)
- Trace port interface unit (TPIU)
- Trace bus funnel (CSTF)
- Embedded trace FIFO (ETF)
- Serial-wire output (SWO)

These components are accessible by the debugger via the system APB-AP and its associated APB-D debug bus. They are also accessible by the Cortex-M7 processor.

The MCU debug unit (DBGMCU) is also accessed via the APB-D. This non-CoreSight component contains registers for configuring the behavior of the device in debug mode.

A trace bus replicator branches the trace bus from the CPU ITM CoreSight component to ETF and SWO.

### 64.5.1 System ROM tables

There are two ROM tables on the APB-D bus. The ROM table is a CoreSight component that contains the base addresses of all the CoreSight components on the APB-D bus. These tables allow a debugger to discover the topology of the CoreSight components automatically.

The first table points to the second table and to the CoreSight components located in the SmartRun power domain: SWO. The DBGMCU is not referenced by the table as it is not a standard CoreSight component. The table occupies a 4-Kbyte, 32-bit wide chunk of APB-D address space, from 0xE00E0000 to 0xE00E0FFC when accessed by the debugger, and from 0x5C000000 to 0x5C000FFC when accessed from the system bus.

**Table 527. System ROM table 1**

Address offset in ROM table	Component name	Component base address (debugger)	Component base address (system bus)	Component address offset	Size (Kbytes)	Entry
0x000	-	-	-	-	4	0x00001002
0x004	-	-	-	-	4	0x00002002

0x014	-	-	-	-	4	0x00006002
0x018	-	-	-	-	4	0x00007002
0x01C	-	-	-	-	4	0x00008002
0c020	Top of table	-	-	-	-	0x00000000
0x024 to 0xFC8	Reserved	-	-	-	-	0x00000000
0xFCC to 0xFFC	ROM table registers	-	-	-	-	See <a href="#">System ROM registers</a>

The top of each ROM table contains a number of read-only registers, including the standard CoreSight component and peripheral identity registers, see section [System ROM registers](#).

Each debug component occupies one or more 4-Kbyte blocks of address space. This block of address space is referred to as the debug register file for the component.

The component address offset field of a ROM Table entry points to the start of the last 4-Kbyte block of the address space of the component. This block always contains the component and peripheral ID registers for the component, starting at offset 0xFD0 from the start of the block. The 4-Kbyte count field PIDR4 [7:4] specifies the number of 4-Kbyte blocks for the component.

Therefore, the process for finding the start of the address space for a component is the following:

1. Read the ROM-table entry for the component and extract its Address\_Offset[18:0] from bits [31:12] of the ROM-table entry.
2. Use the address offset, together with the base address of the ROM table, ROM\_Base\_Address, to calculate the base address of the component:  

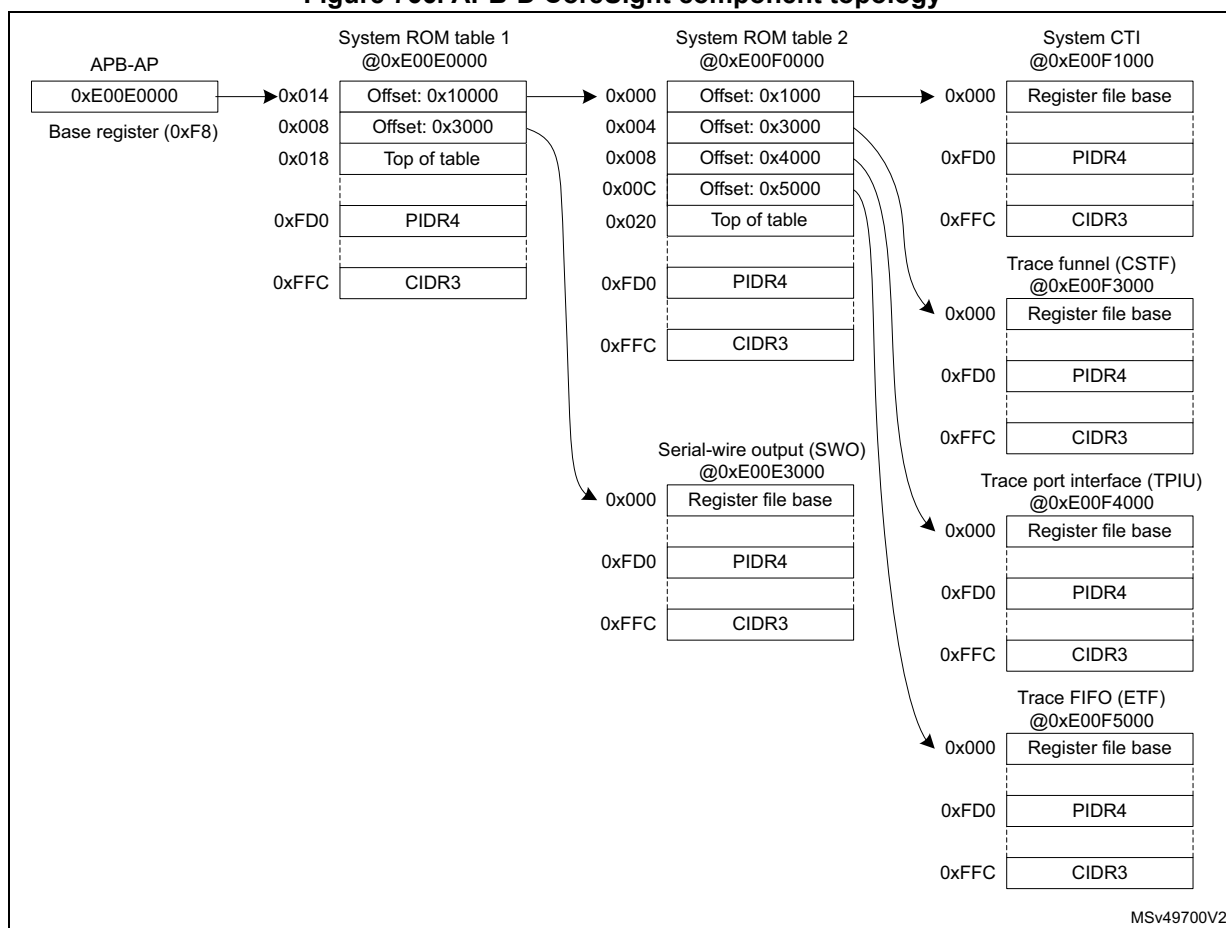

$$\text{Component\_Base\_Address} = \text{ROM\_Base\_Address} + \text{Address\_Offset}$$

The Component\_Base\_Address is the start address of the 4-Kbyte block of the address space for the component.
3. Read the peripheral ID4 register for the component. The address of this register is:  

$$\text{Peripheral\_ID4\_address} = \text{Component\_Base\_Address} + 0xFD0$$
4. Extract the 4-Kbyte count field [7:4] from the value of the peripheral ID4 register.
5. Use the 4-Kbyte count field value to calculate the start address of the address space for the component. If the field value is 0b0000, that corresponds to a count value of 1, the address space for the component starts at Component\_Base\_Address obtained at step 2.

The topology for the CoreSight components on the APB-D is shown in the figure below.

**Figure 766. APB-D CoreSight component topology**

For more information on the use of the ROM table, refer to the Arm Debug Interface Architecture Specification [1].

**System ROM registers**

**SYSROM memory type register (SYSROM\_MEMTYPE)**

### 64.5.2 Cross trigger interfaces (CTI) and matrix (CTM)

The cross trigger interfaces (CTI) and cross trigger matrix (CTM) together form the CoreSight embedded cross trigger feature. There are two CTI components, one at system level and one dedicated to the Cortex-M7. The two CTIs are connected to each other via the CTM. The system-level CTI is accessible to the debugger via the system access port and associated APB-D. The Cortex-M7 CTI is physically integrated in the Cortex-M7 core and is accessible via the Cortex-M7 access port and associated AHBD.

Figure 767. Embedded cross trigger

The CTIs allow events from various sources to trigger debug and/or trace activity. For example, a transition detected on an external trigger input can start code trace or halt the processor.

Each CTI has up to eight trigger inputs and eight trigger outputs. Any input can be connected to any output, on the same CTI or on another CTI via the CTM.

The trigger input and output signals for each CTI are listed in the tables below.

Table 531. System CTI inputs

#	Source signal	Source component	Comments
0	DBTRIGI	GPIO	External trigger input - allows an external signal to generate a debug event.
1	ETFACQCOMP	ETF	ETF capture finished - allows a debug event to be generated when the trace FIFO is empty.
2	ETFFULL	ETF	ETF full flag - allows a debug event to be generated when the trace FIFO is full.
3	-	-	Not used

**Table 531. System CTI inputs (continued)**

#	Source signal	Source component	Comments

6	-	-	Not used
7	-	-	Not used

**Table 532. System CTI outputs**

#	Output signal	Destination component	Comments
0	DBTRIGO	GPIO	External IO trigger output - allows monitoring of events on the external DBTRIGO pin.
1	TPIUFLUSH	TPIU	Trace port flush trigger - causes the TPIU FIFO to be flushed.
2	TPIUTRIG	TPIU	Trace port enable trigger - starts trace output on the external trace port.
3	ETFTRIG	ETF	ETF enable trigger - starts filling the Trace FIFO.
4	ETFFLUSH	ETF	ETF flush trigger - causes the Trace FIFO to be flushed.
5	-	-	Not used
6	-	-	Not used
7	-	-	Not used

**Table 533. Cortex-M7 CTI inputs**

#	Source signal	Source component	Comments
0	HALTED	Cortex-M7 CPU	CPU halted - indicates CPU is in debug mode.
1	COMPMATCH0	Cortex-M7 DWT	DWT comparator 0 match
2	COMPMATCH1	Cortex-M7 DWT	DWT comparator 1 match
3	COMPMATCH2	Cortex-M7 DWT	DWT comparator 2 match
4	ETMEXTOUT0	Cortex-M7 ETM	ETM external trigger out
5	ETMEXTOUT1	Cortex-M7 ETM	ETM external trigger out
6	-	-	Not used
7	-	-	Not used

**Table 534. Cortex-M7 CTI outputs**

#	Output signal	Destination component	Comments
0	EDBGRQ	Cortex-M7 CPU	CPU halt request - puts CPU in debug mode.
1	nIRQ1	Cortex-M7 NVIC	Interrupt request
2	nIRQ2	Cortex-M7 NVIC	Interrupt request

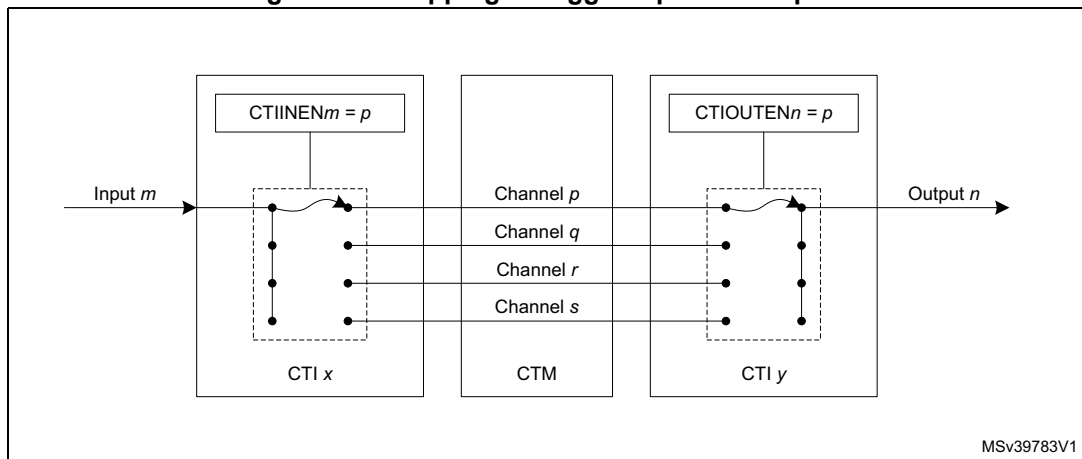

**Table 534. Cortex-M7 CTI outputs (continued)**

#	Output signal	Destination component	Comments
3	-	-	Not used
4	ETMEVENTS0	Cortex-M7 ETM	ETM trig request - enables CPU execution trace
5	ETMEVENTS1	Cortex-M7 ETM	ETM trig request - enables CPU execution trace
6	-	-	Not used
7	DBGRESTART	Cortex-M7 CPU	CPU restart request - CPU exits debug mode

There are four event channels in the cross trigger matrix, that allows up to four parallel bidirectional connections between trigger inputs and outputs on different CTIs. To connect input number  $m$  on CTI  $x$  to output number  $n$  on CTI  $y$ , the input must be connected to an event channel  $p$  using the CTIINEN $m$  register of CTI  $x$ . The same channel  $p$  must be connected to the output using the CTIOUTEN $n$  register of CTI  $y$ . Note that this applies even if the input and output belong to the same CTI.

An input can be connected to more than one channel (up to four), so an input can be routed to several outputs. Similarly, an output can be connected to several inputs. It is also possible to connect several inputs/outputs to the same channel.

**Figure 768. Mapping of trigger inputs to outputs**

For more information on the cross-trigger interface CoreSight component, refer to the Arm CoreSight SoC-400 Technical Reference Manual [2].

**CTI registers**

The register file base address for each CTI is defined by the ROM table for the bus to which it is connected. The registers are the same for each CTI.

**CTI control register (CTI\_CONTROL)**

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GLBEN
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **GLBEN**: global enable

0: cross-triggering disabled

1: cross-triggering enabled

**CTI trigger acknowledge register (CTI\_INTACK)**

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	INTACK[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **INTACK[7:0]**: trigger acknowledge

There is one bit of this register for each CTITRIGOUT output. When a 1 is written to a bit in this register, the corresponding CTITRIGOUT output is acknowledged, causing it to be cleared.

**CTI application trigger set register (CTI\_APPSET)**

Address offset: 0x014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	APPSET[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **APPSET[3:0]**: set channel event

Read:

- xxx0: channel 0 event inactive
- xxx1: channel 0 event active
- xx0x: channel 1 event inactive
- xx1x: channel 1 event active
- x0xx: channel 2 event inactive
- x1xx: channel 2 event active
- 0xxx: channel 3 event inactive
- 1xxx: channel 3 event active

Write:

- xxx0: no effect
- xxx1: Sets event on channel 0.
- xx0x: no effect
- xx1x: Sets event on channel 1.
- x0xx: no effect
- x1xx: Sets event on channel 2.
- 0xxx: no effect
- 1xxx: Sets event on channel 3.

**CTI application trigger clear register (CTI\_APPCLEAR)**

Address offset: 0x018

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	APPCLEAR[3:0]			
												w	w	w	w

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **APPCLEAR[3:0]**: clear channel event

- xxx0: no effect
- xxx1: Clears event on channel 0.
- xx0x: no effect
- xx1x: Clears event on channel 1.
- x0xx: no effect
- x1xx: Clears event on channel 2.
- 0xxx: no effect
- 1xxx: Clears event on channel 3.

**CTI application pulse register (CTI\_APPPULSE)**

Address offset: 0x01C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	APPPULSE[3:0]			
												w	w	w	w

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **APPPULSE[3:0]**: pulse channel event

- This register clears itself immediately.
- xxx0: no effect
  - xxx1: Generates pulse on channel 0.
  - xx0x: no effect
  - xx1x: Generates pulse on channel 1.
  - x0xx: no effect
  - x1xx: Generates pulse on channel 2.
  - 0xxx: no effect
  - 1xxx: Generates pulse on channel 3.

**CTI trigger IN x enable register (CTI\_INENx)**

Address offset: 0x020 + 4 \* x, where x = 0 to 7

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRIGINEN[3:0]			
												r/w	r/w	r/w	r/w

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **TRIGINEN[3:0]**: cross-trigger event enable

Enables or disables a cross-trigger event on each of the four channels when CTITRIGIN<sub>x</sub> is activated (x = 0 to 7).

xxx0: Trigger n does not generate events on channel 0.

xxx1: Trigger n generates events on channel 0.

xx0x: Trigger n does not generate events on channel 1.

xx1x: Trigger n generates events on channel 1.

x0xx: Trigger n does not generate events on channel 2.

x1xx: Trigger n generates events on channel 2.

0xxx: Trigger n does not generate events on channel 3.

1xxx: Trigger n generates events on channel 3.

**CTI trigger OUT x enable register (CTI\_OUTEN<sub>x</sub>)**

Address offset: 0x0A0 + 4 \* x, where x = 0 to 7

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRIGOUTEN[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **TRIGOUTEN[3:0]**: enable trigger upon event

For each channel, the field defines whether an event on that channel generates a trigger on CTITRIGOUT<sub>x</sub> (x = 0 to 7).

xxx0: Channel 0 events do not generate triggers on trigger output n.

xxx1: Channel 0 events generate triggers on trigger output n.

xx0x: Channel 1 events do not generate triggers on trigger output n.

xx1x: Channel 1 events generate triggers on trigger output n.

x0xx: Channel 2 events do not generate triggers on trigger output n.

x1xx: Channel 2 events generate triggers on trigger output n.

0xxx: Channel 3 events do not generate triggers on trigger output n.

1xxx: Channel 3 events generate triggers on trigger output n.

**CTI trigger IN status register (CTI\_TRGISTS)**

Address offset: 0x130

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRIGINSTATUS[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **TRIGINSTATUS[7:0]**: trigger input status

There is one bit of the register for each CTITRIGIN input. When a bit is set to 1, it indicates that the corresponding trigger input is active. When it is set to 0, the corresponding trigger input is inactive.

**CTI trigger OUT status register (CTI\_TRGOSTS)**

Address offset: 0x134

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRIGOUTSTATUS[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **TRIGOUTSTATUS[7:0]**: trigger output status

There is one bit of the register for each CTITRIGOUT output. When a bit is set to 1, it indicates that the corresponding trigger output is active. When it is set to 0, the corresponding trigger output is inactive.

**CTI channel IN status register (CTI\_CHINSTS)**

Address offset: 0x138

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CHINSTATUS[3:0]			
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CHINSTATUS[3:0]**: channel input status

There is one bit of the register for each channel input. When a bit is set to 1, it indicates that the corresponding channel input is active. When it is set to 0, the corresponding channel input is inactive.

**CTI channel OUT status register (CTI\_CHOUTSTS)**

Address offset: 0x13C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CHOUTSTATUS[3:0]			
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CHOUTSTATUS[3:0]**: channel output status

There is one bit of the register for each channel output. When a bit is set to 1, it indicates that the corresponding channel output is active. When it is set to 0, the corresponding channel output is inactive.

**CTI channel gate register (CTI\_GATE)**

Address offset: 0x140

Reset value: 0x0000 000F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GATEEN[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **GATEEN[3:0]**: channel output enable

For each channel, this field defines whether an event on that channel can propagate over the CTM to other CTIs.

- xxxX0: Channel 0 events do not propagate.
- xxx1: Channel 0 events propagate.
- xx0x: Channel 1 events do not propagate.
- xx1x: Channel 1 events propagate.
- x0xx: Channel 2 events do not propagate.
- x1xx: Channel 2 events propagate.
- 0xxx: Channel 3 events do not propagate.
- 1xxx: Channel 3 events propagate.

**CTI claim tag set register (CTI\_CLAIMSET)**

Address offset: 0xFA0

Reset value: 0x0000 000F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMSET[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: Set claim tag bits

Write:

- 0000: no effect
- xxx1: Sets bit 0.
- xx1x: Sets bit 1.
- x1xx: Sets bit 2.
- 1xxx: Sets bit 3.

Read:

- 1111: Indicates there are four bits in claim tag.

**CTI claim tag clear register (CTI\_CLAIMCLR)**

Address offset: 0xFA4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMCLR[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: reset claim tag bits

Write:

0000: no effect

xxx1: Clears bit 0.

xx1x: Clears bit 1.

x1xx: Clears bit 2.

1xxx: Clears bit 3.

Read: Returns current value of claim tag.

**CTI lock access register (CTI\_LAR)**

Address offset: 0xFB0

Reset value: 0xFFFF XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ACCESS_W[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ACCESS_W[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **ACCESS\_W[31:0]**: CTI register write access enable

This field enables write access to some CTI registers by processor cores (debuggers do not need to unlock the component).

0xC5ACCE55: write access enabled

Other values: write access disabled

**CTI lock status register (CTI\_LSR)**

Address offset: 0xFB4

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCKTYPE	LOCKGRANT	LOCKEXIST
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: size of the CTI\_LAR register  
 0: 32-bit

Bit 1 **LOCKGRANT**: current status of lock  
 This bit always returns zero when read by an external debugger.  
 0: write access permitted  
 1: write access blocked. Only read access is permitted.

Bit 0 **LOCKEXIST**: existence of lock control mechanism  
 The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.  
 0: no lock control mechanism  
 1: lock control mechanism implemented

**CTI authentication status register (CTI\_AUTHSTAT)**

Address offset: 0xFB8

Reset value: 0x0000 000A

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: security level for secure non-invasive debug  
 0x0: not implemented

Bits 5:4 **SID[1:0]**: security level for secure invasive debug  
 0x0: not implemented

Bits 3:2 **NSNID[1:0]**: security level for non-secure non-invasive debug  
 0x2: disabled  
 0x3: enabled

Bits 1:0 **NSID[1:0]**: security level for non-secure invasive debug  
 0x2: disabled  
 0x3: enabled

**CTI device configuration register (CTI\_DEVID)**

Address offset: 0xFC8

Reset value: 0x0004 0800

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NUMCH[3:0]			
												r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUMTRIG[7:0]								Res.	Res.	Res.	EXTMUXNUM[4:0]				
r	r	r	r	r	r	r	r				r	r	r	r	r

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **NUMCH[3:0]**: number of ECT channels available  
 0x4: four channels

Bits 15:8 **NUMTRIG[7:0]**: number of ECT triggers available  
 0x8: height trigger inputs and height trigger outputs

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **EXTMUXNUM[4:0]**: number of trigger input/output multiplexers  
 0x0: none

**CTI device type identifier register (CTI\_DEVTYPE)**

Address offset: 0xFCC

Reset value: 0x0000 0014

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SUBTYPE[3:0]				MAJORTYPE[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SUBTYPE[3:0]**: sub-classification

0x1: Indicates that this component is a cross-triggering component.

Bits 3:0 **MAJORTYPE[3:0]**: major classification

0x4: Indicates that this component allows a debugger to control other components in a CoreSight SoC-400 system.

**CTI CoreSight peripheral identity register 4 (CTI\_PIDR4)**

Address offset: 0xFD0

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 64.5.3 Trace funnel (CSTF)

The trace funnel is a CoreSight component that combines the ATB buses from two trace sources into one single ATB. The CSTF has two ATB slave ports, and one ATB master port. An arbiter selects the slave ports according to a programmable priority.

The slave ports are connected as follows:

- S0: Cortex-M7 ETM
- S1: Cortex-M7 ITM

The CSTF registers allow the slave ports to be individually enabled, and their priority settings to be configured. The priorities can be modified only when trace is disabled. The arbitration works as follows:

- The arbiter selects the slave port with the highest assigned priority that has data valid
- Up to *min\_hold\_time* transfers are passed from the selected slave to the master port, where *min\_hold\_time* is programmable in the CONTROL register.
- A new arbitration is then performed

High priority should be assigned to slave ports connected to sources with a small amount of buffering, or where data loss can not be tolerated. Low priority should be assigned to less critical sources or those with large buffers.

For more information on the ATB Funnel CoreSight component, refer to the Arm® CoreSight™ SoC-400 Technical Reference Manual [2].

### Trace funnel registers

#### CSTF control register (CSTF\_CTRL)

Address offset: 0x000

Reset value: 0x0000 0300

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	MIN_HOLD_TIME[3:0]				Res.	Res.	Res.	Res.	Res.	Res.	ENS1	ENS0
				rw	rw	rw	rw							rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:8 **MIN\_HOLD\_TIME[3:0]**: number of transactions between arbitrations

- 0x0: 1 transaction
- :
- 0xE: 15 transactions
- 0xF: reserved

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **ENS1**: slave port S1 enable

- 0: S1 port disabled
- 1: S1 port enabled

Bit 0 **ENS0**: slave port S0 enable

- 0: S0 port disabled
- 1: S0 port enabled

**CSTF priority register (CSTF\_PRIORITY)**

Address offset: 0x004

Reset value: 0x0000 0688

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIPORT1[2:0]			PRIPORT0[2:0]		
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:3 **PRIPORT1[2:0]**: slave port S1 priority

- 0: highest priority
- :
- 7: lowest priority

Bits 2:0 **PRIPORT0[2:0]**: Slave port S0 priority

- 0: highest priority
- :
- 7: lowest priority

**CSTF claim tag set register (CSTF\_CLAIMSET)**

Address offset: 0xFA0

Reset value: 0x0000 000F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMSET[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: set claim tag bits

- Write:
- 0000: no effect
- xxx1: Sets bit 0.
- xx1x: Sets bit 1.
- x1xx: Sets bit 2.
- 1xxx: Sets bit 3.

- Read:
- 0xF: Indicates there are four bits in claim tag;

**CSTF claim tag clear register (CSTF\_CLAIMCLR)**

Address offset: 0xFA4

Reset value: 0x0000 0000

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMCLR[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: reset claim tag bits

Write:

0000: no effect

xxx1: Clears bit 0.

xx1x: Clears bit 1.

x1xx: Clears bit 2.

1xxx: Clears bit 3.

Read: Returns current value of claim tag.

**CSTF lock access register (CSTF\_LAR)**

Address offset: 0xFB0

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ACCESS_W[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ACCESS_W[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **ACCESS\_W[31:0]**: CSTF register write access enable

The field enables write access to some CSTF registers by processor cores (debuggers do not need to unlock the component).

0xC5ACCE55: write access enabled

Other values: write access disabled

**CSTF lock status register (CSTF\_LSR)**

Address offset: 0xFB4

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCKTYPE	LOCKGRANT	LOCKEXIST
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: size of the CSTF\_LAR register  
0: 32-bit

Bit 1 **LOCKGRANT**: current status of lock  
This bit always returns zero when read by an external debugger.  
0: write access permitted  
1: write access blocked. Only read access is permitted.

Bit 0 **LOCKEXIST**: existence of lock control mechanism  
This bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.  
0: no lock control mechanism  
1: lock control mechanism implemented

**CSTF authentication status register (CSTF\_AUTHSTAT)**

Address offset: 0xFB8

Reset value: 0x0000 000A

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 64.5.4 Embedded trace FIFO (ETF)

The ETF is a 4-Kbyte memory that captures trace data from two trace sources, ETM and ITM, of the CPU core. The ETF is a design configuration of the CoreSight trace memory controller component.

The ETF can be used in three modes (selected in the mode register):

1. Hardware FIFO mode

The trace memory is used as a FIFO that is drained through the ATB master interface. Trace data is captured into the trace RAM and when full, the incoming trace stream is

stalled. When the trace buffer is not empty, trace data is drained out through the ATB master interface to the TPIU.

In this mode, the role of the FIFO is to smooth the flow of trace information arriving at the trace port. Since the trace data can be very bursty in nature, the peak data rate can easily exceed the port capability, resulting in an overflow. The ETF allows a steady data rate at the trace port, that can then be sized according to the average rate rather than the peak. The trace is stored off-chip in real time by the trace port analyzer tool, and so the trace log can be very big.

## 2. Software FIFO mode

The trace memory is used as a FIFO that can be read through the ETF\_RRD register while trace is being captured. Trace data is captured into the trace RAM and when full, the incoming trace stream is stalled.

This mode allows the trace to be transferred by DMA into the system memory, or to a high-speed interface (such as SPI or USB), or even monitored by software running on one of the cores. Note that unlike the hardware FIFO mode, this mode is invasive, since it uses system resources that are shared by the processor.

## 3. Circular buffer mode

The trace memory is used as a circular buffer. Trace data is captured into the trace memory starting from the location pointed to by the write pointer register. Even when the trace memory is full, incoming trace data continues to be overwritten into the trace memory until a stop condition occurs.

In this mode, the ETF stores the trace data on-chip, so the trace log size is limited to that of the ETF SRAM, 4 Kbytes in this case. Being a circular buffer, if the FIFO becomes full, incoming trace data overwrites the oldest stored data and the oldest stored data is lost. Therefore the content of the trace buffer represents the most recent activity of the processor, up to the point when the buffer was stopped, rather than all the activity since the trace was started.

There are three possible methods to read out the buffer contents once the trace stops:

- via the trace port - with the TPIU enabled, the content of the buffer is output over the trace port. This can be done by setting the DRAINBUF bit in the ETF\_FFCR register.
- via the debug port - the debugger can read the buffer via the RRD register that is accessible over the system APB-D.
- by software - the processor can read the buffer via the RRD register, since the APB-D is accessible from the system bus.

The ETF transition between the following states are described below:

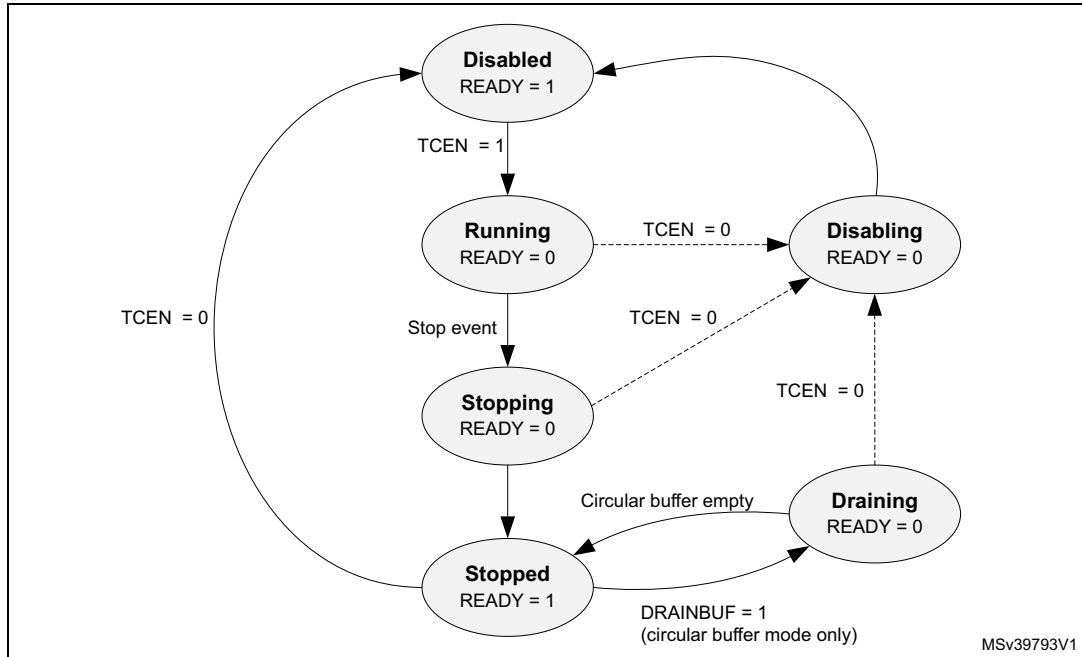

- Disabled  
This state is entered after a reset or when trace capture is disabled. The ETF must only be programmed in this state.
- Running  
Trace capture is performed in this state. It is entered by enabling trace capture while in Disabled state.
- Stopped  
Trace capture is stopped in this state but the content of the buffer can be read out or drained. This state is entered after a stop event (trigger or flush).
- Disabling  
This is a transitional state while disabling trace capture.

- Stopping  
This is a transitional state while stopping trace capture.
- Draining  
This state is entered while draining the buffer in Stopped state.

The state transition diagram is shown in the figure below.

Figure 769. ETF state transition diagram

For more information on the trace memory controller CoreSight component, refer to the Arm CoreSight trace memory controller technical reference manual [3].

**ETF registers**

**ETF RAM size register (ETF\_RSZ)**

Address offset: 0x004

Reset value: 0x0000 0400

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	RSZ[30:16]														
	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RSZ[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bit 31 Reserved, must be kept at reset value.

Bits 30:0 **RSZ[30:0]**: RAM size

The value of the field indicates the number of 32-bit words.

0x400: 1024 words = 4 Kbytes

**ETF status register (ETF\_STS)**

Address offset: 0x00C

Reset value: 0x0000 001C

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EMPTY	FEMPTY	READY	TRIGD	FULL
											r	r	r	r	r

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **EMPTY**: trace FIFO empty

This bit is valid only when the TCEN bit of the ETF\_CTL register is high. This bit reads as zero when TCEN is low.

0: Trace FIFO contains data.

1: Trace FIFO is empty.

*Note: Empty trace FIFO does not mean that the ETF pipeline is empty. The latter is indicated by the FEMPTY bit.*

Bit 3 **FEMPTY**: formatter empty

This bit is set when trace capture has stopped and all internal pipelines and buffers have drained. Unlike the READY bit, it is not affected by buffer drains. The ACQCOMP output reflects the value of this bit.

Bit 2 **READY**: ETF ready

This bit is set when trace capture has stopped and all internal pipelines and buffers have drained (Stopped or Disabled state).

Bit 1 **TRIGD**: triggered

This bit is set when trace capture is in progress and the TMC has detected a trigger event. This bit is cleared when leaving Disabled state.

This bit is operational only in the circular buffer mode. In all other modes, this bit is always low.

This bit does not indicate that a trigger has been embedded in the formatted output trace data from the TMC. Trigger indication on the output trace stream is determined by the programming of the formatter and flush control register, ETF\_FFRCR.

Bit 0 **FULL**: Trace buffer full

In circular buffer mode, this flag is set when the RAM write pointer wraps around the top of the buffer, and remains set until the TCEN bit of the ETF\_CTL register is cleared and set.

In software and hardware FIFO modes, this flag indicates that the current space in the trace memory is less than or equal to the value programmed in the ETF\_BUFWM register, that is, fill level  $\geq$  MEM\_SIZE - BUFWM.

This bit is cleared when leaving Disabled state. The FULL output reflects the value of this register bit.

**ETF RAM read data register (ETF\_RRD)**

Address offset: 0x010

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RRD[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RRD[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RRD[31:0]**: RAM read data.

Circular buffer mode:

When in Stopped state and the buffer is not empty, reading this register returns the next word of data from the trace buffer. When all of the trace buffer has been read, the Empty bit in the ETF\_STS Register is set, and subsequent reads return 0xFFFFFFFF. Reading this register when not in Stopped state returns 0xFFFFFFFF.

Software FIFO mode:

Reading this register returns data from the FIFO. If this register is read when the FIFO is empty, the data returned is 0xFFFFFFFF.

Hardware FIFO mode:

Reading this register returns 0xFFFFFFFF.

### ETF RAM read pointer register (ETF\_RRP)

Address offset: 0x014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	RRP[12:0]												
			r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:0 **RRP[12:0]**: RAM read pointer

This register contains the value of the read pointer that is used to read entries from the trace memory over the APB interface via the ETF\_RRD register. The pointer can be programmed with a byte address, 64-bit aligned (that is, bits 0 to 3 must be zero). The pointer is incremented by eight each time a full 64-bit FIFO entry has been written. When the pointer reaches its maximum value, it wraps around.

This register can only be written in Disabled state. It can be read in Disabled state, in Stopped state in Circular buffer mode and SW FIFO mode, and also in Running and Stopping states in SW FIFO mode.

### ETF RAM write pointer register (ETF\_RWP)

Address offset: 0x018

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	RWP[12:0]												
			r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:0 **RWP[12:0]**: RAM write pointer

This register contains the value of the write pointer that is used to write entries into the trace memory over the APB interface via the ETF\_RWD register. The pointer can be programmed with a byte address, 64-bit aligned (that is, bits 0 to 3 must be zero). The pointer is incremented by eight each time a full 64-bit FIFO entry has been read. When the pointer reaches its maximum value, it wraps around.

This register can only be written in Disabled state. It can be read in Disabled state, in Stopped state in Circular buffer mode and SW FIFO mode, and also in Running and Stopping states in SW FIFO mode.

**ETF trigger counter register (ETF\_TRG)**

Address offset: 0x01C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	TRG[10:0]										
					r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **TRG[10:0]**: trigger counter

In circular buffer mode, this field specifies the number of 32-bit words to capture in the trace RAM following the detection of either a rising edge on the TRIGIN input or a trigger packet in the incoming trace stream, ATID =7'h7D. On capturing the specified number of data words, a trigger event occurs. The effect of a trigger event on the ETF behavior is controlled by the FFCR Register.

The number of 32-bit words written into the trace RAM following the trigger is the value stored in this register, plus one. This register is ignored when the ETF is in software FIFO mode or hardware FIFO mode. When the trigger counter starts counting, any additional triggers, either on TRIGIN or in the incoming trace stream, are ignored until the counter reaches zero. When the trigger counter has reached zero, it remains at zero until it is re-programmed with a write to this register.

This register is cleared when the READY bit of ETF\_STS register goes high, so that the state of the counter when trace capture has stopped, does not affect a subsequent trace capture session. Writing to this register when not in Disabled state, results in unpredictable behavior.

A read access to this register is permitted at any time when in Disabled state or in circular buffer mode. A read access returns the current value of the trigger counter.

**ETF control register (ETF\_CTL)**

Address offset: 0x020

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TCEN
															r/w

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **TCEN**: trace capture enable

When writing:

0: trace capture disabled (moves from Running, Stopping or Stopped state into Disabling or Disabled state)

1: trace capture enabled (moves from Disabled state into Running state)

When reading, this bit is low when in Disabling or Disabled states, and high otherwise.

**ETF RAM write data register (ETF\_RWD)**

Address offset: 0x024

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RWD[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RWD[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **RWD[31:0]**: RAM write data

When in Disabled state, a write to this register stores data at the location pointed to by the RWP. Writes to this register when not in Disabled state are ignored. When a full memory width (64-bit) of data has been written, the data is written to memory and the RAM write pointer is incremented to the next memory word.

This register is used for test purposes.

**ETF mode register (ETF\_MODE)**

Address offset: 0x028

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MODE[1:0]	
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **MODE[1:0]**: operation mode

00: circular buffer mode

In this mode, the trace memory is used as a circular buffer. Trace data is captured into the trace memory starting from the location pointed to by the write pointer register. Even when the trace memory is full, incoming trace data continues to be overwritten into the trace memory until a stop condition occurs.

01: software FIFO mode

In this mode, the trace memory is used as a FIFO that can be read through the RRD register while trace is being captured. Trace data is captured into the trace RAM and when full, the incoming trace stream is stalled.

10: hardware FIFO mode

In this mode, the trace memory is used as a FIFO that is drained through the ATB master interface. Trace data is captured into the trace RAM and when full, the incoming trace stream is stalled. When the trace buffer is non-empty, trace data is drained out through the ATB master interface to the TPIU.

11: reserved

### ETF latched buffer fill level register (ETF\_LBUFLVL)

Address offset: 0x02C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	LBUFLEVEL[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **LBUFLEVEL[11:0]**: latched buffer fill level

Reading this register returns the maximum fill level of the trace memory in 32-bit words since this register was last read. Reading this register also results in its contents being updated to the current fill level.

When entering Disabled state, this register retains its last value. While in Disabled state, reads from this register do not affect its value. When exiting Disabled state, the LBUFLEVEL register is cleared.

This register is used for performance analysis of the trace system.

**ETF current buffer fill level register (ETF\_CBUFLVL)**

Address offset: 0x030

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CBUFLEVEL[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **CBUFLEVEL[11:0]**: current buffer fill level

Reading this register returns the current fill level of the trace memory in 32-bit words.  
This register is cleared when TCEN is low.

**ETF buffer level watermark register (ETF\_BUFWM)**

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	BUFWM[10:0]										
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **BUFWM[10:0]**: buffer level watermark

The value programmed into this register indicates the required threshold vacancy level (in 32-bit words) in the trace memory. When the space in the FIFO is less than or equal to this value (that is Fill level  $\geq$  MEM\_SIZE - BUFWM), the FULL output is pulled high and the FULL bit in the STS register is set.

This register is used only in software FIFO and hardware FIFO modes. In circular buffer mode, this functionality can be obtained by programming the RWP to the required vacancy trigger level, so that, when the pointer wraps around, the FULL bit is set indicating that the vacancy level has fallen below the required level.

The maximum value that can be written into this register is MEM\_SIZE - 1. In this case, the FULL bit output is asserted after the first 32-bit word is written to trace memory.

Writing to this register other than when in disabled state results in unpredictable behavior.

**ETF formatter and flush status register (ETF\_FFSR)**

Address offset: 0x300

Reset value: 0x0000 0002

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FTSTOPPED	FLINPROG
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **FTSTOPPED**: formatter stopped

This bit behaves in the same way as the FEMPTY bit in the ETF\_STS register.

Bit 0 **FLINPROG**: flush in progress

this bit indicates whether a flush on the ATB slave port is in progress. It reflects the status of the AFVALIDS output. A flush can be initiated by the flush control bits in the ETF\_FFCR register, or requested by the ATB master port.

0: no flush in progress

1: flush in progress

**ETF formatter and flush control register (ETF\_FFCR)**

Address offset: 0x304

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	DRAINBUF	STPONTRGEV	STOPONFL	Res.	TRIGONFL	TRGONTRGEV	TRGONTRGIN	Res.	FLUSHMAN	FONTRGEV	FONFLIN	Res.	Res.	ENTI	ENFT
	rw	rw	rw		rw	rw	rw		rw	rw	rw			rw	rw

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **DRAINBUF**: drain buffer

This bit is used to enable draining of the trace data through the ATB master interface after the formatter has stopped. This is useful in circular buffer mode to capture trace data into trace memory and then to drain the captured trace through the ATB master interface.

Writing 1 to this bit when in Stopped state starts the drain of the contents of the trace buffer through the ATB master interface. This bit always reads as zero. The READY bit in the ETF\_STS register goes low while the drain is in progress.

This bit is functional only when the ETF is in circular buffer mode and formatting is enabled, that is, the ENFT bit in the ETF\_FFCR register is set. Setting this bit when the ETF is in any other mode or when not in Stopped state, results in unpredictable behavior.

When trace capture is complete in circular buffer mode, all the captured trace must be retrieved from the trace memory through the same mechanism, either read all trace data out through RRD reads, or drain all trace data by setting the DRAINBUF bit. Setting the DRAINBUF bit after some of the captured trace has been read out through RRD, results in unpredictable behavior.

Bit 13 **STPONTRGEV**: stop on trigger event

0: no effect

1: Stops trace capture when a trigger event occurs.

Enabling the ETF in software FIFO mode or hardware FIFO mode with this bit set, results in unpredictable behavior.

Bit 12 **STOPONFL**: stop on flush

0: no effect

1: Stops trace capture when flush is completed.

If a flush is initiated by the ATB master interface, its completion does not lead to a formatter stop regardless of the value programmed in this bit.

Bit 11 Reserved, must be kept at reset value.

Bit 10 **TRIGONFL**: trigger on flush

0: no effect

1: Indicates a trigger in the trace stream when flush is completed.

If ENFT and ENTI are both clear, this bit is ignored and no trigger is inserted into the trace stream.

If a flush is initiated by the ATB master interface, its completion does not lead to a trigger indication regardless of the value programmed in this bit.

Bit 9 **TRGONTRGEV**: trigger on trigger event

0: No effect

1: Indicates a trigger in the trace stream when trigger event occurs.

If ENFT and ENTI are both clear, this bit is ignored and no trigger is inserted into the trace stream.

This bit is not supported in software FIFO mode or hardware FIFO mode.

Bit 8 **TRGONTRGIN**: trigger on trigger in

0: no effect

1: Indicates a trigger in the trace stream when a rising edge is detected on the TRIGIN input.

If ENFT and ENTI are both clear, this bit is ignored and no trigger is inserted into the trace stream.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **FLUSHMAN**: manual flush

0: no effect

1: Flushes the trace FIFO and pipeline.

This bit is cleared automatically when the flush completes. If the TCEN bit in the ETF\_CTL register is 0, writes to this bit are ignored.

Bit 5 **FONTRGEV**: flush on trigger event

0: no effect

1: Flushes the trace FIFO and pipeline if a trigger event occurs.

This bit is not supported in software FIFO mode or hardware FIFO mode. If STPONTRGEV is set, this bit is ignored.

Bit 4 **FONFLIN**: flush on flush in

0: no effect

1: Flushes the trace FIFO and pipeline when a rising edge is detected on the FLUSHIN input.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **ENTI**: Enable trigger insertion

Setting this bit enables the insertion of triggers in the formatted trace stream. A trigger is indicated by inserting one byte of data 8'h00 with ATID 7'h7D in the trace stream. Trigger indication on the trace stream is additionally controlled by the register bits TRIGONFL, TRGONTRGEV, and TRGONTRGIN in the ETF\_FFCR register. This bit can only be changed when READY is high, and TCEN is low. This bit takes effect only when the ENFT bit in this register is set. If the ENTI bit is set to high when ENFT is low, it results in formatting being enabled.

Bit 0 **ENFT**: enable formatting.

0: formatting disabled. Incoming trace data is assumed to be from a single trace source.

1: formatting enabled.

If multiple ATIDs are received by the ETF when trace capture is enabled and the formatter is disabled, it results in interleaving of trace data. Disabling of formatting is supported only in circular buffer mode. If the ETF is enabled in a mode other than circular buffer mode with ENFT low, it results in formatting being enabled. If the ENTI bit is set to high when ENFT is low, it results in formatting being enabled.

This bit is ignored when in Disabled state.

### ETF periodic synchronization counter register (ETF\_PSCR)

Address offset: 0x308

Reset value: 0x0000 000A

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PSCOUNT[4:0]				
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **PSCOUNT[4:0]**: synchronization counter reload value

This field determines the reload value of the synchronization counter. The reload value takes effect the next time the counter reaches zero. Reads from this register return the reload value programmed into this register. This register is set to 0xA on reset, corresponding to a synchronization period of 1024 bytes.

0x0: synchronization disabled

0x1-0x6: reserved

0x7-0x1B: synchronization period is  $2^{PSCOUNT}$  bytes

0x1C-0x1F: reserved

### ETF claim tag set register (ETF\_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMSET[3:0]				
													rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: set claim tag bits

Write:

0000: no effect

xxx1: Sets bit 0.

xx1x: Sets bit 1.

x1xx: Sets bit 2.

1xxx: Sets bit 3.

Read:

0xF: Indicates there are four bits in claim tag.

### ETF claim tag clear register (ETF\_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMCLR[3:0]				
													rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: reset claim tag bits

Write:

0000: no effect

xxx1: Clears bit 0..

xx1x: Clears bit 1

x1xx: Clears bit 2.

1xxx: Clears bit 3.

Read: Returns current value of claim tag.

### ETF lock access register (ETF\_LAR)

Address offset: 0xFB0

Reset value: 0xFFFF XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ACCESS_W[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ACCESS_W[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **ACCESS\_W[31:0]**: ETF register access enable

Enables write access to some ETF registers by processor cores (debuggers do not need to unlock the component)

0xC5ACCE55: write access enabled

Other values: write access disabled

### ETF lock status register (ETF\_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCKTYPE	LOCKGRANT	LOCKEXIST
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: size of the ETF\_LAR register  
 0: 32-bit

Bit 1 **LOCKGRANT**: current status of lock  
 This bit always returns zero when read by an external debugger.  
 0: write access permitted  
 1: write access blocked. Only read access is permitted.

Bit 0 **LOCKEXIST**: existence of lock control mechanism  
 The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.  
 0: no lock control mechanism  
 1: lock control mechanism implemented

**ETF authentication status register (ETF\_AUTHSTAT)**

Address offset: 0xFB8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SNID[1:0]		SID[1:0]		NSNID[1:0]		NSID[1:0]	
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: security level for secure non-invasive debug  
 0x0: not implemented

Bits 5:4 **SID[1:0]**: security level for secure invasive debug  
 0x0: not implemented

Bits 3:2 **NSNID[1:0]**: security level for non-secure non-invasive debug  
 0x0: not implemented

Bits 1:0 **NSID[1:0]**: security level for non-secure invasive debug  
 0x0: not implemented

**ETF device configuration register (ETF\_DEVID)**

Address offset: 0xFC8

Reset value: 0x0000 01C0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	MEMWIDTH[2:0]			CONFIGTYP[1:0]		CLKSCHEM	ATBINPORTCNT[4:0]				
					r	r	r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:8 **MEMWIDTH[2:0]**: memory interface data bus width  
 0x3: 64 bits (corresponds to 32-bit ATB data)

Bits 7:6 **CONFIGTYP[1:0]**: configuration type of component (ETB, ETR or ETF)  
 0x2: ETF

Bit 5 **CLKSCHEM**: RAM clocking scheme (synchronous or asynchronous)  
 0: synchronous

Bits 4:0 **ATBINPORTCNT[4:0]**: number/type of ATB input port multiplexing  
 0x0: none

**ETF device type identifier register (ETF\_DEVTYPE)**

Address offset: 0xFCC

Reset value: 0x0000 0032

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SUBTYPE[3:0]				MAJORTYPE[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SUBTYPE[3:0]**: Sub-classification  
 0x3: Captures trace data from the ATB slave interface into RAM that can be drained through the ATB master interface

Bits 3:0 **MAJORTYPE[3:0]**: Major classification  
 0x2: Component is a trace link because it has an ATB master interface through which trace data can be drained out in Hardware FIFO mode.

**ETF CoreSight peripheral identity register 4 (ETF\_PIDR4)**

Address offset: 0xFD0

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 64.5.5 Trace port interface unit (TPIU)

The TPIU is a CoreSight component that formats the trace stream and outputs it on the external trace port signals. The TPIU has a single ATB slave port for incoming trace data. The trace port is a synchronous parallel port, comprising a clock output, TRACECLK, and four data outputs, TRACED(3:0). The trace port width is programmable in the range 1 to 4. Using a smaller port width reduces the number of test points/connector pins needed, and frees up I/Os for other purposes. However it restricts the bandwidth of the trace port and hence the quantity of trace information that can be output in real time. The TRACECLK output must be enabled by setting the TRACECLKEN bit in the DBGMCU\_CR register

before trace is sent to the TPIU. TRACECLK is running at half the frequency of the TRACEPORTCK provided by the RCC. The TRACEPORTCK frequency and clock source can be programmed in the RCC.

For more information on the trace port interface CoreSight component, refer to the Arm CoreSight SoC-400 technical reference manual [2].

**TPIU registers**

**TPIU supported port size register (TPIU\_SUPPSIZE)**

Address offset: 0x000

Reset value: 0x0000 00FF

Bits 31:0 **PORTSIZE[31:0]**: supported trace port sizes, from 1 to 32 pins.  
 Bit n-1 when set indicates that port size n is supported.  
 0x0000 00FF: port sizes 1 to 4 supported  
*Note:* This value corresponds to 8 ports out of which only 4 are connected.

**TPIU current port size register (TPIU\_CURPSIZE)**

Address offset: 0x004

Reset value: 0x0000 0001

Bits 31:0 **PORTSIZE[31:0]**: current trace port size  
 Bit n-1 when set indicates that the current port size is n pins. The value of n must be within the range of supported port sizes (1-4). Only one bit can be set, or unpredictable behavior may result. This register must only be modified when the formatter is stopped.

**TPIU supported trigger modes register (TPIU\_SUPTRGM)**

Address offset: 0x100

Reset value: 0x0000 011F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **TRGRUN**: trigger running  
 0: Trigger has not occurred or counter is at 0.  
 1: Trigger has occurred and counter is not at 0.

Bit 16 **TRIGD**: triggered  
 0: Trigger has not occurred.  
 1: Trigger has occurred and counter has reached 0.

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **TCOUNT8**: 8-bit counter register  
 1: implemented

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **MULT64K**: multiplying the trigger counter by 65536 support  
 1: supported

Bit 3 **MULT256**: multiplying the trigger counter by 256 support  
 1: supported

Bit 2 **MULT16**: multiplying the trigger counter by 16 support  
 1: supported

Bit 1 **MULT4**: multiplying the trigger counter by 4 support  
 1: supported

Bit 0 **MULT2**: multiplying the trigger counter by 2 support

								r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **TRIGCOUNT[7:0]**: enable trigger delay indication

This field enables delaying the indication of triggers to any external connected trace capture or storage devices. This counter is only 8-bit wide and is intended to be used only with the counter multipliers in the trigger multiplier register, 0x108. When a trigger is started, this value, in combination with the multiplier, is the number of words before the trigger is indicated. When the trigger counter reaches 0, the value written here is reloaded. Writing to this register causes the trigger counter value to reset but does not reset any values on the multiplier. Reading this register returns the preset value, not the current count.

**TPIU trigger multiplier register (TPIU\_TRGMULT)**

Address offset: 0x108

Reset value: 0x0000 0000

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **PCONTEN**: support of continuous mode

- 1: supported

Bit 16 **PTIMEEN**: support of timed mode

- 1: supported

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **PATF0**: support of FF/00 pattern

- This bit indicates whether the FF/00 pattern is supported as output over the trace port.
- 1: supported

Bit 2 **PATA5**: support of AA/55 pattern

- This bit indicates whether the AA/55 pattern is supported as output over the trace port.
- 1: supported

Bit 1 **PATW0**: support of walking 0's pattern

- This bit indicates whether the walking 0's pattern is supported as output over the trace port.
- 1: supported

Bit 0 **PATW1**: support of walking 1's pattern

- This bit indicates whether the walking 1's pattern is supported as output over the trace port.
- 1: supported

**TPIU current test pattern/mode register (TPIU\_CURTPM)**

Address offset: 0x204

Reset value: 0x0000 0000

								r/w	r/w	r/w	r/w	r/w	r/w	r/w	r/w		

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PATTCOUNT[7:0]**: number of TRACEPORTCK cycles

This field provides a 8-bit counter value to indicate the number of TRACEPORTCK cycles for which a pattern runs before it switches to the next pattern.

**TPIU formatter and flush status register (TPIU\_FFSR)**

Address offset: 0x300

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TCPRESENT	FTSTOPPED	FLINPROG
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TCPRESENT**: TRACECTL output pin availability

This bit indicates whether the optional TRACECTL output pin is available for use.  
0: TRACECTL pin is not present in this device.

Bit 1 **FTSTOPPED**: formatter stopped

The formatter has received a stop request signal and all trace data and post-amble are sent. Any additional trace data on the ATB interface is ignored.  
0: Formatter has not stopped.  
1: Formatter has stopped.

Bit 0 **FLINPROG**: flush in progress

This bit indicates whether a flush on the ATB slave port is in progress. This bit reflects the status of the AFVALIDS output. A flush can be initiated by the flush control bits in the TPIU\_FFCR register.  
0: no flush in progress  
1: flush in progress

**TPIU formatter and flush control register (TPIU\_FFCR)**

Address offset: 0x304

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

		rw	rw		rw	rw	rw		rw	rw	rw			rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **STOPTRIG**: stop on trigger event

- 0: no effect
- 1: Stops formatter when a trigger event occurs.

Bit 12 **STOPFL**: stop on flush

- 0: no effect
- 1: Stops formatter when flush is completed.

Bit 11 Reserved, must be kept at reset value.

Bit 10 **TRIGFL**: trigger on flush

- 0: no effect
- 1: Indicates a trigger in the trace stream when flush is completed.

Bit 9 **TRIG EVT**: trigger on trigger event

- 0: no effect
- 1: Indicates a trigger in the trace stream when trigger event occurs.

Bit 8 **TRIGIN**: trigger on trigger in

- 0: No effect
- 1: Indicates a trigger in the trace stream when the TRIGIN input from the system CTI is asserted.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **FONMAN**: generate a manual flush

- 0: no effect
  - 1: Flushes the trace.
- This bit is cleared automatically when the flush completes.

Bit 5 **FONTRIG**: flush on trigger event

- A trigger event occurs when the trigger counter reaches 0, or, if the trigger counter is 0, when the TRIGIN input from the system CTI is high.
- 0: no effect
- 1: Flushes the trace if a trigger event occurs.

Bit 4 **FONFLIN**: flush on flush in

- 0: no effect
- 1: Flushes the trace if the FLUSHIN input from the system CTI is asserted.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **ENFCONT**: enable continuous formatting

- 0: continuous formatting disabled
- 1: continuous formatting enabled

Bit 0 **ENFTC**: enable the embedding of triggers in formatted trace

- 0: formatting disabled
- 1: formatting enabled

**TPIU formatter synchronization counter register (TPIU\_FSCR)**

Address offset: 0x400

Reset value: 0x0000 0040

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CYCCOUNT[11:0]											
				rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **CYCCOUNT[11:0]**: effective use of TPAs enable

This field enables the effective use of different-sized TPAs without wasting large amounts of storage capacity of the capture device. This counter contains the number of formatter frames since the last synchronization packet of 128 bits. It is a 12-bit counter with a maximum count value of 4096. This equates to synchronization every 65536 bytes, that is, 4096 packets x 16 bytes per packet. The default is set up for a synchronization packet every 1024 bytes, that is, every 64 formatter frames. If the formatter is configured for continuous mode, full and half-word sync frames are inserted during normal operation. Under these circumstances, the count value is the maximum number of complete frames between full synchronization packets.

**TPIU claim tag set register (TPIU\_CLAIMSET)**

Address offset: 0xFA0

Reset value: 0x0000 000F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCKTYPE	LOCKGRANT	LOCKEXIST
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: size of the TPIU\_LAR register  
 0: 32-bit

Bit 1 **LOCKGRANT**: current status of lock  
 This bit always returns zero when read by an external debugger.  
 0: write access permitted  
 1: write access blocked. Only read access is permitted.

Bit 0 **LOCKEXIST**: existence of lock control mechanism  
 The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.  
 0: no lock control mechanism  
 1: lock control mechanism implemented

**TPIU authentication status register (TPIU\_AUTHSTAT)**

Address offset: 0xFB8

Reset value: 0x0000 0000

				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bit 11 **SWOUARTNRZ**: support of SWO UART or NRZ  
This bit indicates whether serial wire output, UART or NRZ, is supported.  
0: not supported

Bit 10 **SWOMAN**: support of SWO Manchester format  
This bit indicates whether serial wire output, Manchester encoded format, is supported.  
0: not supported

Bit 9 **TCLKDATA**: support of trace clock plus data  
0: not supported

Bits 8:6 **FIFOSIZE[2:0]**: FIFO size in powers of 2  
0x2: FIFO size = 4 (16 bytes)

Bit 5 **CLKRELAT**: ATB clock and TRACEPORTCK relation  
Indicates the relationship between the ATB clock and TRACEPORTCK (synchronous or asynchronous)  
1: asynchronous

Bits 4:0 **MUXNUM[4:0]**: number/type of ATB input port multiplexing  
0x0: none

**TPIU device type identifier register (TPIU\_DEVTYPE)**

Address offset: 0xFCC

Reset value: 0x0000 0011

### 64.5.6 Serial-wire output (SWO)

The SWO is a CoreSight component that formats the trace stream from the processor ITM and outputs it on the single wire TRACESWO output.

Compared to the TPIU, the SWO contains:

- no formatter
- no pattern generator
- an 8-bit ATB input
- no synchronous trace output, that is, no TRACEDATA or TRACECLK pins
- no support for flush
- no support for triggering

The SWO output supports Manchester encoded and UART NRZ formats.

For more information about the serial wire output CoreSight component, refer to the Arm® CoreSight Components Technical Reference Manual [4].

**SWO registers**

**SWO current output divisor register (SWO\_CODR)**

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	PRESCALER[12:0]												
Res.	Res.	Res.	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:0 **PRESCALER[12:0]**: SWO baud rate scaling

The baud rate is the TRACEPORTCK clock frequency divided by (PRESCALER + 1). The baud rate changes instantly, so it is recommended to stop the trace source and wait until the port is idle before writing to this register.

**SWO selected pin protocol register (SWO\_SPPR)**

Address offset: 0x0F0

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PPROT[1:0]	
														rW	rW

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **PPROT[1:0]**: pin protocol

- 01: Manchester
- 011: NRZ
- others: reserved

**SWO formatter and flush status register (SWO\_FFSR)**

Address offset: 0x300

Reset value: 0x0000 0008

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FTNOSTOP	TCPRESENT	FTSTOPPED	FLINPROG
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **FTNOSTOP**: change of settings without stopping formatter  
 1: Change of settings is allowed with formatter running.

Bit 2 **TCPRESENT**: TRACECTL pin present on SWO  
 0: TRACECTL pin not present

Bit 1 **FTSTOPPED**: formatter stopped  
 0: formatter running  
 The bit always returns 0 as the SWO formatter cannot be stopped in this device.

Bit 0 **FLINPROG**: flush in progress  
 0: Flush is not in progress.  
 The bit always returns 0 as SWO flushing is not supported in this device.

**SWO claim tag set register (SWO\_CLAIMSET)**

Address offset: 0xFA0

Reset value: 0x0000 000F

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMSET[3:0]			
												r	r	r	r

Bits 31:0 **ACCESS\_W[31:0]**: SWO register write access enable

This register enables write access to some SWO registers by processor cores (debuggers do not need to unlock the component)  
 0xC5ACCE55: write access enabled  
 Other values: write access disabled

**SWO lock status register (SWO\_LSR)**

Address offset: 0xFB4

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCKTYPE	LOCKGRANT	LOCKEXIST
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: size of the SWO\_LAR register  
 0: 32-bit

Bit 1 **LOCKGRANT**: current status of lock  
 This bit always returns zero when read by an external debugger.  
 0: write access permitted  
 1: write access blocked - only read access is permitted

Bit 0 **LOCKEXIST**: existence of lock control mechanism  
 The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.  
 0: no lock control mechanism  
 1: lock control mechanism implemented

**SWO authentication status register (SWO\_AUTHSTAT)**

Address offset: 0xFB8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: security level for secure non-invasive debug  
0x0: not implemented

Bits 5:4 **SID[1:0]**: security level for secure invasive debug  
0x0: not implemented

Bits 3:2 **NSNID[1:0]**: security level for non-secure non-invasive debug  
0x0: not implemented

Bits 1:0 **NSID[1:0]**: security level for non-secure invasive debug  
0x0: not implemented

**SWO device configuration register (SWO\_DEVID)**

Address offset: 0xFC8

Reset value: 0x0000 0EA0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bit 11 **SWUARTNRZ**: SWO UART or NRZ support  
This bit indicates whether serial wire output, UART or NRZ, is supported.  
1: supported

Bit 10 **SWOMAN**: SWO Manchester format support  
This bit indicates whether serial wire output, Manchester encoded format, is supported.  
1: supported

Bit 9 **TCLKDATA**: trace clock plus data support  
This bit indicates whether trace clock plus data is supported  
1: supported

Bits 8:6 **FIFOSIZE[2:0]**: FIFO size in powers of 2  
0x2: FIFO size = 4 (16 bytes)

Bit 5 **CLKRELAT**: ATB clock to TRACEPORTCK relation  
This bit indicates the relationship between the ATB clock and TRACEPORTCK (synchronous or asynchronous)  
1: asynchronous

Bits 4:0 **MUXNUM[4:0]**: number/type of ATB input port multiplexing  
0x0: none

**SWO device type identifier register (SWO\_DEVTYPE)**

Address offset: 0xFCC

Reset value: 0x0000 0011

### 64.5.7 Microcontroller debug unit (DBGMCU)

The DBGMCU component contains a number of registers that control the power and clock behavior in debug mode. Specifically it allows the debugger, or debug software, to:

- maintain the clock and power to the processor core when in low-power modes (Sleep, Stop or Standby)
- maintain the clock and power to the system debug and trace components when in low-power modes
- stop the clock to certain peripherals (CAN, SMBUS timeout, watchdogs, timers, RTC) when the processor core is stopped in debug mode. For timers having complementary outputs, the outputs are disabled (as if the MOE bit was reset) for safety purposes when the counter is stopped (TIM1/8/15/16/17 = 1 in DBGMCU\_APB2FZ1).

The DBGMCU registers are not reset by a system reset, only by a power-on reset. They are accessible to the debugger via the APB-D bus at base address 0xE00E1000. They are also accessible by software at base address 0x5C001000

Note: the DBGMCU is not a standard CoreSight component. Therefore, it does not appear in the system ROM table.

#### DBGMCU registers

##### DBGMCU identity code register (DBGMCU\_IDC)

Address offset: 0x000

Reset value: 0x1000 6480

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REV_ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.				DEV_ID[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 **REV\_ID[15:0]**: revision

0x1000 = revision A

0x1001 = revision Z

0x1007 = revision X

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **DEV\_ID[11:0]**: device ID

0x480: STM32H7A3/7B3/7B0

**DBGMCU configuration register (DBGMCU\_CR)**

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	TRGOEN	Res.	Res.	Res.	Res.	Res.	SRDBGCKEN	CDBGCKEN	TRACELKEN	Res.	Res.	Res.	Res.
			r/w						r/w	r/w	r/w				
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBGSTBY_CD	DBGSTOP_CD	DBGSLEEP_CD
													r/w	r/w	r/w

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **TRGOEN**: external trigger output enable

This bit controls the direction of the bi-directional trigger pin, TRGIO.

0: input - TRGIO is connected to TRGIN

1: output - TRGIO is connected to TRGOUT

Bits 27:23 Reserved, must be kept at reset value.

Bit 22 **SRDBGCKEN**: SmartRun domain debug clock enable

This bit allows the debug components in the SmartRun domain (excluding the DAPCLK domain) to be switched off if they are not needed.

0: disabled - SmartRun domain debug components are disabled and their clocks gated.

1: enabled - SmartRun domain debug components are clocked whenever the corresponding domain clock (rcc\_fclk\_srd) is active.

Bit 21 **CDBGCKEN**: CPU domain debug clock enable

This bit allows the debug components in the CPU domain (excluding those in the processor core) to be switched off if they are not needed.

0: disabled - CPU domain debug components are disabled and their clocks gated.

1: enabled - CPU domain debug components are clocked whenever the corresponding domain clock (rcc\_aclk) is active.

Bit 20 **TRACELKEN**: Trace port clock enable for SWO and TPIU

This bit enables the trace port clock, TRACEPORTCK.

0: TRACEPORTCK disabled

1: TRACEPORTCK enabled

Bits 19:3 Reserved, must be kept at reset value.

Bit 2 **DBGSTBY\_CD**: CPU domain debug in Standby mode

0: normal operation - all clocks are disabled and the CPU domain is powered down automatically in Standby mode.

1: automatic clock stop/power-down disabled - all active clocks and oscillators continue to run during Standby mode, and the CPU domain supply is maintained, allowing full debug capability. On exit from Standby mode, a domain reset is performed.

Bit 1 **DBGSTOP\_CD**: CPU domain debug in Stop mode

0: normal operation - all clocks are disabled automatically in Stop mode.

1: automatic clock stop disabled - all active clocks and oscillators continue to run during Stop mode, allowing full debug capability. On exit from Stop mode, the clock settings is set to the Stop mode exit state.

Bit 0 **DBGSLEEP\_CD**: CPU domain debug in Sleep mode

0: normal operation - processor clock is stopped automatically in Sleep mode.

1: automatic clock stop disabled - processor clock continues to run, allowing full debug capability.

**DBGMCU APB3 peripheral freeze register (DBGMCU\_APB3FZ1)**

Address offset: 0x034

Reset value: 0x0000 0000

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **I2C3**: I2C3 SMBUS timeout stop in debug

0: normal operation - I2C3 SMBUS timeout continues to operate while the Cortex-M7 core is in debug mode.

1: stop in debug - I2C3 SMBUS timeout is frozen while Cortex-M7 is in debug mode.

Bit 22 **I2C2**: I2C2 SMBUS timeout stop in debug

0: normal operation - I2C2 SMBUS timeout continues to operate while the Cortex-M7 core is in debug mode.

1: stop in debug - I2C2 SMBUS timeout is frozen while Cortex-M7 is in debug mode.

Bit 21 **I2C1**: I2C1 SMBUS timeout stop in debug

0: normal operation - I2C1 SMBUS timeout continues to operate while the Cortex-M7 core is in debug mode.

1: stop in debug - I2C1 SMBUS timeout is frozen while the Cortex-M7 core is in debug mode.

Bits 20:10 Reserved, must be kept at reset value.

Bit 9 **LPTIM1**: LPTIM1 stop in debug

0: normal operation - LPTIM1 continues to operate while the Cortex-M7 core is in debug mode.

1: stop in debug - LPTIM1 is frozen while Cortex-M7 is in debug mode.

Bit 8 **TIM14**: TIM14 stop in debug

0: normal operation - TIM14 continues to operate while the Cortex-M7 core is in debug mode.

1: stop in debug - TIM14 is frozen while Cortex-M7 is in debug mode.

Bit 7 **TIM13**: TIM13 stop in debug

0: normal operation - TIM13 continues to operate while the Cortex-M7 core is in debug mode.

1: stop in debug - TIM13 is frozen while Cortex-M7 is in debug mode.

Bit 6 **TIM12**: TIM12 stop in debug

0: normal operation - TIM12 continues to operate while the Cortex-M7 core is in debug mode.

1: stop in debug - TIM12 is frozen while Cortex-M7 is in debug mode.

Bit 5 **TIM7**: TIM7 stop in debug

0: normal operation - TIM7 continues to operate while the Cortex-M7 core is in debug mode.

1: stop in debug - TIM7 is frozen while Cortex-M7 is in debug mode.

Bit 4 **TIM6**: TIM6 stop in debug

0: normal operation - TIM6 continues to operate while the Cortex-M7 core is in debug mode.

1: stop in debug - TIM6 is frozen while Cortex-M7 is in debug mode.

Bit 3 **TIM5**: TIM5 stop in debug

0: normal operation - TIM5 continues to operate while the Cortex-M7 core is in debug mode.

1: stop in debug - TIM5 is frozen while Cortex-M7 is in debug mode.

- Bit 2 **TIM4**: TIM4 stop in debug
  - 0: normal operation - TIM4 continues to operate while the Cortex-M7 core is in debug mode.
  - 1: stop in debug - TIM4 is frozen while Cortex-M7 is in debug mode.
- Bit 1 **TIM3**: TIM3 stop in debug
  - 0: normal operation - TIM3 continues to operate while the Cortex-M7 core is in debug mode.
  - 1: stop in debug - TIM3 is frozen while Cortex-M7 is in debug mode.
- Bit 0 **TIM2**: TIM2 stop in debug
  - 0: normal operation - TIM2 continues to operate while the Cortex-M7 core is in debug mode.
  - 1: stop in debug - TIM2 is frozen while Cortex-M7 is in debug mode.

**DBGMCU APB2 peripheral freeze register (DBGMCU\_APB2FZ1)**

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **WDGLSCD**: LS watchdog for CPU domain stop in debug

0: normal operation - watchdog continues to count while the Cortex-M7 core is in debug mode.

1: stop in debug - watchdog is frozen while Cortex-M7 is in debug mode.

Bit 17 Reserved, must be kept at reset value.

Bit 16 **RTC**: RTC stop in debug

0: normal operation - RTC continues to operate while the Cortex-M7 core is in debug mode.

1: stop in debug - RTC is frozen while Cortex-M7 is in debug mode.

Bits 15:11 Reserved, must be kept at reset value.

Bit 10 **LPTIM3**: LPTIM2 stop in debug

0: normal operation - LPTIM2 continues to operate while the Cortex-M7 core is in debug mode.

1: stop in debug - LPTIM2 is frozen while Cortex-M7 is in debug mode.

Bit 9 **LPTIM2**: LPTIM2 stop in debug

0: normal operation - LPTIM2 continues to operate while the Cortex-M7 core is in debug mode.

1: stop in debug - LPTIM2 is frozen while Cortex-M7 is in debug mode.

Bit 8 Reserved, must be kept at reset value.

Bit 7 **I2C4**: I2C4 SMBUS timeout stop in debug

0: normal operation - I2C4 SMBUS timeout continues to operate while the Cortex-M7 core is in debug mode.

1: stop in debug - I2C4 SMBUS timeout is frozen while the Cortex-M7 core is in debug mode.

Bits 6:0 Reserved, must be kept at reset value.

### 64.6 Cortex-M7 debug functional description

The Cortex-M7 subsystem features the following CoreSight components:

- ROM tables
- System control space (SCS)
- Breakpoint unit (FPB)
- Data watchpoint and trace unit (DWT)
- Instrumentation trace macrocell (ITM)
- Embedded trace macrocell (ETM)
- Cross trigger interface (CTI)

These components are accessible by the debugger via the Cortex-M7 AHB-AP and its associated AHBD bus.

## 64.6.1 Cortex-M7 ROM tables

The ROM tables are CoreSight components that contain the base addresses of all the CoreSight debug components accessible via the AHBD. These tables allow a debugger to discover the topology of the CoreSight system automatically.

There are two ROM tables in the Cortex-M7 sub-system:

- Cortex-M7 CPU ROM table  
This table is pointed to by the base register in the Cortex-M7 AHB-AP. It contains the base address pointers for the ETM and CTI, as well as for the Cortex-M7 PPB ROM table.
- Cortex-M7 PPB (private peripheral bus) ROM table  
This table contains pointers to the Cortex-M7 system control space registers, allowing the debugger to identify the CPU core, as well as to the remaining CoreSight components in the Cortex-M7 subsystem: FPB, DWT and ITM.

The CPU ROM table occupies a 4-Kbyte, 32-bit wide chunk of AHBD address space, from 0xE00FE000 to 0xE00FEFFC.

**Table 541. Cortex-M7 CPU ROM table**

Address in ROM table	Component name	Component base address	Component address offset	Size (Kbytes)	Entry
0xE00FE000	Cortex-M7 PPB ROM table	0xE00FF000	0x00001000	4	0x00001003
0xE00FE004	Cortex-M7 ETM	0xE0041000	0xFFF43000	4	0xFFF43003
0xE00FE008	Cortex-M7 CTI	0xE0043000	0xFFF45000	4	0xFFF45003
0xE00FE00C	Reserved	-	-	-	0x1FF02002
0xE00FE010	Top of table	-	-	-	0x00000000
0xE00FE010 to 0xE00FEFC8	Reserved	-	-	-	0x00000000
0xE00FEFCC to 0xE00FEFFC	ROM table registers	-	-	-	See <a href="#">Table 543</a>

The Cortex-M7 PPB ROM table occupies a 4-Kbyte, 32-bit wide chunk of APB-D address space, from 0xE00FF000 to 0xE00FFFC.

**Table 542. Cortex-M7 PPB ROM table**

Address in ROM table	Component name	Component base address	Component address offset	Size (Kbytes)	Entry
0xE00FF000	SCS	0xE000E000	0xFFF0F000	4	0xFFF0F003
0xE00FF004	DWT	0xE0001000	0xFFF02000	4	0xFFF02003
0xE00FF008	FPB	0xE0002000	0xFFF03000	4	0xFFF03003
0xE00FF00C	ITM	0xE0000000	0xFFF01000	4	0xFFF01003
0xE00FF010	TPIU <sup>(1)</sup>	0xE0040000	0xFFF41000	4	0xFFF41002
0xE00FF014	ETM <sup>(1)</sup>	0xE0041000	0xFFF42000	4	0xFFF42002

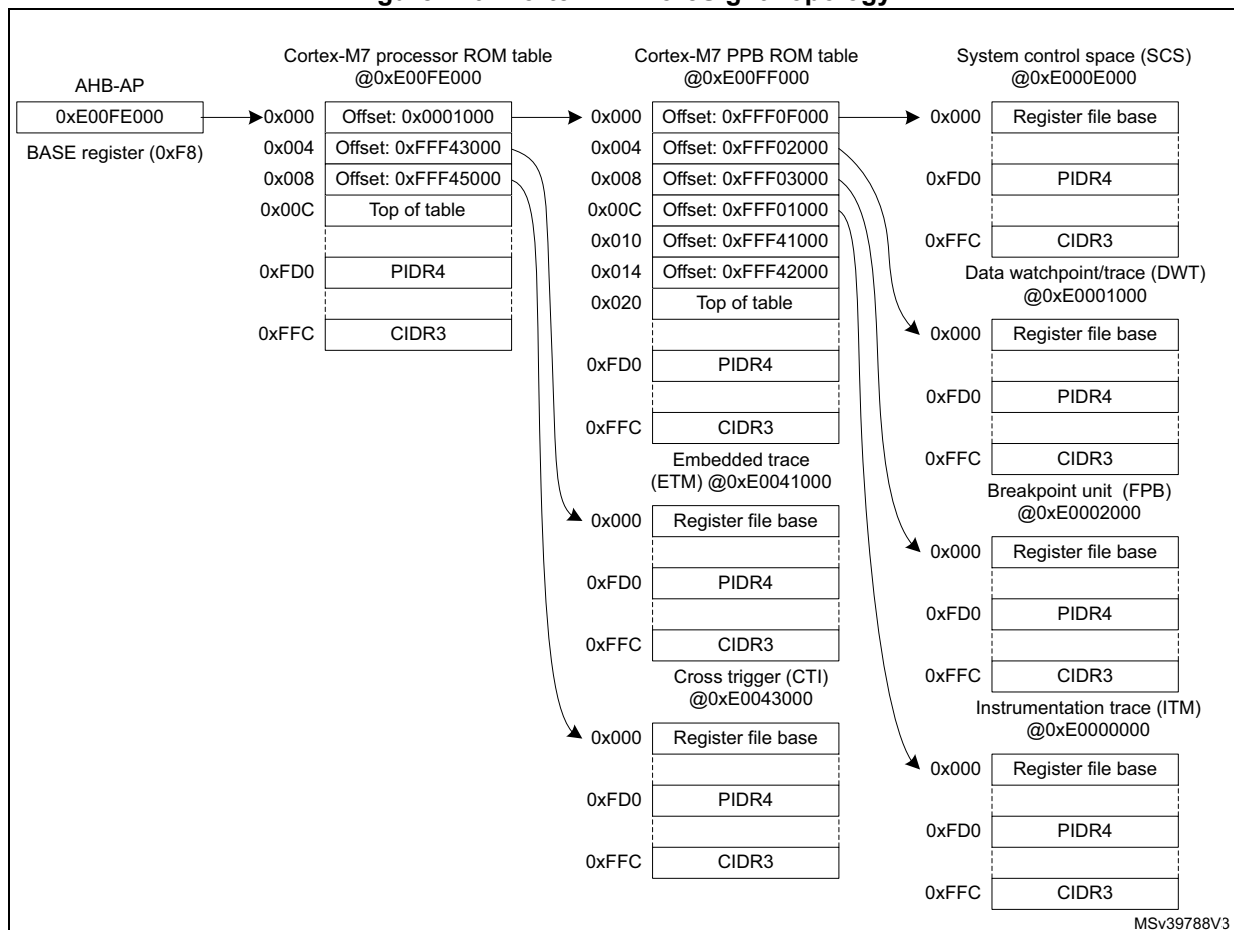

**Table 542. Cortex-M7 PPB ROM table (continued)**

Address in ROM table	Component name	Component base address	Component address offset	Size (Kbytes)	Entry
0xE00FF018	Top of table	-	-	-	0x00000000
0xE00FF01C to 0xE00FFFC8	Reserved	-	-	-	0x00000000
0xE00FFFC8 to 0xE00FFFFC	ROM table registers	-	-	-	See <a href="#">Table 544</a>

1. The TPIU and ETM are included in this table by default but bit 0 is reset to indicate that they are not present.

The topology for the CoreSight components in the Cortex-M7 subsystem is shown in the figure below.

**Figure 770. Cortex-M7 CoreSight Topology**

**Cortex-M7 CPU ROM registers**

## 64.6.2 Cortex-M7 data watchpoint and trace unit (DWT)

The DWT provides four comparators that can be used as:

- watchpoint
- ETM trigger
- PC sampling trigger
- data address sampling trigger
- data comparator (comparator 1 only)
- clock cycle counter comparator (comparator 0 only)

It also contains counters for:

- clock cycles
- folded instructions
- load store unit (LSU) operations
- sleep cycles
- number of cycles per instruction
- interrupt overhead

A DWT comparator compares one of the following with the value held in its DWT\_COMP register:

- a data address
- an instruction address
- a data value
- the cycle count value, for comparator 0 only.

For address matching, the comparator can use a mask, so it matches a range of addresses.

On a successful match, the comparator generates one of the following:

- one or more DWT data trace packets, containing one or more of:
  - the address of the instruction that caused a data access
  - an address offset, bits[15:0] of the data access address
  - the matched data value
- a watchpoint debug event, on either the PC value or the accessed data address
- a CMPMATCH[N] event that signals the match outside the DWT unit

A watchpoint debug event either generates a DebugMonitor exception or causes the processor to halt execution and enter Debug state.

For more details on how to use the DWT, refer to the Arm v7-M Architecture Reference Manual [\[5\]](#).

### Cortex-M7 DWT registers

#### DWT control register (M7\_DWT\_CTRL)

Address offset: 0x000

Reset value: 0x4000 0000

31				30			29		28		27		26		25		24		23		22		21		20		19		18		17		16	
NUMCOMP[3:0]				NOTRCPKT		NOEXTTRIG		NOCYCCNT		NOPRFCNT		Res.		CYCEVTENA		FOLDEVTENA		LSUEVTENA		SLEEPEVTENA		EXCEVTENA		CPIEVTENA		EXCTRCENA

Res.			Res.			Res.			PCSAMPLENA		SYNCTAP[1:0]		CYCTAP		POSTINIT[3:0]				POSTRESET[3:0]				CYCCNTENA											
rw			rw			rw			rw		rw		rw		rw		rw		rw		rw		rw		rw		rw							

Bits 31:28 **NUMCOMP[3:0]**: number of comparators implemented (read-only)  
 0x4: four comparators

Bit 27 **NOTRCPKT**: race sampling and exception tracing support (read-only)  
 0: supported

Bit 26 **NOEXTTRIG**: external match signal, CMPMATCH support (read-only)  
 0: supported

Bit 25 **NOCYCCNT**: cycle counter support (read-only)  
 0: supported

Bit 24 **NOPRFCNT**: profiling counter support (read-only)  
 0: supported

Bit 23 Reserved, must be kept at reset value.

Bit 22 **CYCEVTENA**: enable for POSTCNT underflow event counter packet generation  
 0: disabled  
 1: enabled

Bit 21 **FOLDEVTENA**: enable for folded instruction counter overflow event generation  
 0: disabled  
 1: enabled

Bit 20 **LSUEVTENA**: enable for LSU counter overflow event generation  
 0: disabled  
 1: enabled

Bit 19 **SLEEPEVTENA**: enable for sleep counter overflow event generation  
 0: disabled  
 1: enabled

Bit 18 **EXCEVTENA**: enable for exception overhead counter overflow event generation  
 0: disabled  
 1: enabled

Bit 17 **CPIEVTENA**: enable for CPI counter overflow event generation  
 0: disabled  
 1: enabled

Bit 16 **EXTRCENA**: enable for exception trace generation  
 0: disabled  
 1: enabled

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **PCSAMPLENA**: POSTCNT counter use enable  
 This bit enables the use of POSTCNT counter as a timer for periodic PC sample packet generation.  
 0: disabled  
 1: enabled

Bits 11:10 **SYNCTAP[1:0]**: position of synchronization packet counter tap on CYCCNT counter  
 This field determines the synchronization packet rate.  
 0x0: disabled - no synchronization packets  
 0x1: tap at CYCCNT[24]  
 0x2: tap at CYCCNT[26]  
 0x3: tap at CYCCNT[28]

Bit 9 **CYCTAP**: position of the POSTCNT tap on the CYCCNT counter  
 0: tap at CYCCNT[6]  
 1: tap at CYCCNT[10]

Bits 8:5 **POSTINIT[3:0]**: Initial value of the POSTCNT counter  
 Writes to this field are ignored if POSTCNT counter is enabled (that is, CYCEVTENA or PCSAMPLENA must be reset prior to writing POSTINIT).

Bits 4:1 **POSTRESET[3:0]**: reload value of the POSTCNT counter.

Bit 0 **CYCCNTENA**: CYCCNT counter enable  
 0: disabled  
 1: enabled

**DWT cycle count register (M7\_DWT\_CYCCNT)**

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CPICNT[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **CPICNT[7:0]**: CPI counter

This field counts additional cycles required to execute multi-cycle instructions, except those recorded by DWT\_LSUCNT, and counts any instruction fetch stalls.

**DWT exception count register (M7\_DWT\_EXCCNT)**

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EXCCNT[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **EXCCNT[7:0]**: exception overhead cycle counter

This field counts the number of cycles spent in exception processing.

**DWT sleep count register (M7\_DWT\_SLPCNT)**

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SLEPCNT[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **SLEEPCNT[7:0]**: Sleep cycle counter

This field counts the number of cycles spent in Sleep mode (WFI, WFE, sleep-on-exit).

**DWT LSU count register (M7\_DWT\_LSUCNT)**

Address offset: 0x014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LSUCNT[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **LSUCNT[7:0]**: load store counter

This field counts additional cycles required to execute load and store instructions.

**DWT fold count register (M7\_DWT\_FOLDCNT)**

Address offset: 0x018

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FOLDCNT[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **FOLDCNT[7:0]**: folded instruction counter

This field increments on each instruction that takes 0 cycle.

**DWT program counter sample register (M7\_DWT\_PCSR)**

Address offset: 0x01C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EIASAMPLE[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EIASAMPLE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **EIASAMPLE[31:0]**: executed instruction address sample value  
 This field samples the current value of the program counter.

**DWT comparator register x (M7\_DWT\_COMPx)**

Address offset: 0x020 + x \* 0x10 (for x = 0 to 3)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
COMP[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
COMP[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **COMP[31:0]**: reference value for comparison

**DWT mask register x (M7\_DWT\_MASKx)**

Address offset: 0x024 + x \* 0x10 (for x = 0 to 3)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MASK[4:0]				
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **MASK[4:0]**: comparator mask size

This field provides the size of the ignore mask applied to the access address for address range matching by comparator n. A debugger can write 0b11111 to this field and then read the register back to determine the maximum mask size supported.

**DWT function register x (M7\_DWT\_FUNCtx)**

Address offset: 0x028 + x \* 0x10 (for x = 0 to 3)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	MATCHED	Res.	Res.	Res.	Res.	DATAVADDR1[3:0]			
							r					r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATAVADDR0[3:0]				DATAVSIZE[1:0]		LNK1ENA	DATAVMATCH	CYCMATCH	Res.	EMITRANGE	Res.	FUNCTION[3:0]			
r	r	r	r	r	r	r	r	r		r		r	r	r	r

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **MATCHED**: comparator match (read-only)

This bit indicates if a comparator match has occurred since the register was last read.  
 0: no match  
 1: match occurred

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **DATAVADDR1[3:0]**: comparator number of a second comparator

When the DATAVMATCH and LNK1ENA bits are both 1, this field can hold the comparator number of a second comparator to use for linked address comparison.

Bits 15:12 **DATAVADDR0[3:0]**: comparator number of a comparator

When the DATAVMATCH and LNK1ENA bits are both 1, this field can hold the comparator number of a comparator to use for linked address comparison.

Bits 11:10 **DATAVSIZE[1:0]**: size of required data comparison

For data value matching, this field specifies the size of the required data comparison.  
 0x0: byte  
 0x1: half word  
 0x2: word  
 0x3: reserved

Bit 9 **LNK1ENA**: support of a second linked comparator (read-only)

This bit indicates whether use of a second linked comparator is supported (read-only).  
 1: supported

Bit 8 **DATAVMATCH**: cycle comparison enable

- 0: Performs address comparison.
- 1: Performs data value comparison.

Bit 7 **CYCMATCH**: cycle count comparison enable on comparator 0

- This bit is reserved for other comparators.
- 0: no cycle count comparison
- 1: Compares DWT\_COMP0 with the cycle counter, DWT\_CYCCNT.

Bit 6 Reserved, must be kept at reset value.

Bit 5 **EMITRANGE**: data trace address offset packet enable

- This bit enables generation of data trace address offset packets (containing data address bits 0 to 15).
- 0: disabled
- 1: enabled

Bit 4 Reserved, must be kept at reset value.

Bits 3:0 **FUNCTION[3:0]**: action on comparator match

The meaning of this field depends on the setting of the DATAVMATCH and CYCMATCH fields. See [\[5\]](#).

### DWT CoreSight peripheral identity register 4 (M7\_DWT\_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 64.6.3 Cortex-M7 instrumentation trace macrocell (ITM)

The ITM generates trace information as packets. There are four sources that can generate packets. If multiple sources generate packets at the same time, the ITM arbitrates the order in which packets are output. The four sources in decreasing order of priority are:

1. Software trace

Software can write directly to any of 32 x 32-bit ITM stimulus registers to generate packets. The permission level for each port can be programmed. When software writes to an enabled stimulus port, the ITM combines the identity of the port, the size of the write access, and the data written, into a packet that it writes to a FIFO. The ITM outputs packets from the FIFO onto the trace bus. Reading a stimulus port register returns the status of the stimulus register (empty or pending) in bit 0.

2. Hardware trace

The DWT generates trace packets in response to a data trace event, a PC sample or a performance profiling counter wraparound. The ITM outputs these packets on the trace bus.

3. Local timestamping

The ITM contains a 21-bit counter clocked by the (pre-divided) processor clock. The counter value is output in a timestamp packet on the trace bus. The counter is reset to zero every time a timestamp packet is generated. The timestamps thus indicate the time elapsed since the previous timestamp packet.

**Cortex-M7 ITM registers**

**ITM stimulus register x (M7\_ITM\_STIMx)**

Address offset: 0x000 + x \* 0x4 (x = 0 to 31)

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
STIMULUS[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
STIMULUS[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **STIMULUS[31:0]**: software event packet / FIFOREADY  
 Write data is output on the trace bus as a software event packet. When reading, bit 0 is a FIFOREADY indicator:  
 0: Stimulus port buffer is full (or port is disabled).  
 1: Stimulus port can accept new write data.

**ITM trace enable register (M7\_ITM\_TER)**

Address offset: 0xE00

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
STIMENA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
STIMENA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **STIMENA[31:0]**: stimulus port enable  
 Each bit n (0:31) enables the stimulus port associated with the M7\_ITM\_STIMn register.  
 0: port disabled  
 1: port enabled

**ITM trace privilege registers (M7\_ITM\_TPR)**

Address offset: 0xE40

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIVMASK[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **PRIVMASK[3:0]**: enable unprivileged access to ITM stimulus ports

Each bit controls eight stimulus ports:

xxx0: unprivileged access permitted on ports 0 to 7

xxx1: only privileged access permitted on ports 0 to 7

xx0x: unprivileged access permitted on ports 8 to 15

xx1x: only privileged access permitted on ports 8 to 15

x0xx: unprivileged access permitted on ports 16 to 23

x1xx: only privileged access permitted on ports 16 to 23

0xxx: unprivileged access permitted on ports 24 to 31

1xxx: only privileged access permitted on ports 24 to 31

**ITM trace control register (M7\_ITM\_TCR)**

Address offset: 0xE80

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BUSY	TRACEBUSID[6:0]						
								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	TSPRESCALE[1:0]		Res.	Res.	Res.	SWOENA	TXENA	SYNCENA	TSENA	ITMENA
						rw	rw				r	rw	rw	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **BUSY**: ITM busy

Indicates whether the ITM is currently processing events (read-only).

- 0: not busy
- 1: busy

Bits 22:16 **TRACEBUSID[6:0]**: identifier for multi-source trace stream formatting

If multi-source trace is in use, the debugger must write a non-zero value to this field.

Note: different IDs must be used for each trace source in the system.

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:8 **TSPRESCALE[1:0]**: local timestamp prescale

Prescale used with the trace packet reference clock

- 0x0: no prescaling
- 0x1: Divides by 4.
- 0x2: Divides by 16.
- 0x3: Divides by 64.

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **SWOENA**: asynchronous clocking enable for the timestamp counter (read-only)

0: Timestamp counter uses processor clock.

Bit 3 **TXENA**: hardware event packet forwarding enable

This bit enables forwarding of hardware event packets from the DWT unit to the trace port.

- 0: disabled
- 1: enabled

Bit 2 **SYNCENA**: synchronization packet transmission enable

If a debugger sets this bit, it must also configure the DWT\_CTRL register SYNCTAP field in the DWT for the correct synchronization speed.

- 0: disabled
- 1: enabled

Bit 1 **TSENA**: local timestamp generation enable

- 0: disabled
- 1: enabled

Bit 0 **ITMENA**: ITM enable

- 0: disabled
- 1: enabled

### ITM CoreSight peripheral identity register 4 (M7\_ITM\_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

### 64.6.4 Cortex-M7 breakpoint unit (FPB)

The FPB allows hardware breakpoints to be set. It contains eight comparators that monitor the instruction fetch address and return a breakpoint instruction when a match is detected. The Cortex-M7 FPB does not support flash patch functionality.

#### Cortex-M7 FPB registers

##### FPB control register (M7\_FPB\_CTRL)

Address offset: 0x000

Reset value: 0x0000 0080

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	NUM_CODE[6:4]			NUM_LIT[3:0]				NUM_CODE[3:0]				Res.	Res.	KEY	ENABLE
	r	r	r	r	r	r	r	r	r	r	r			r/w	r/w

Bits 31:15 Reserved, must be kept at reset value.

Bits 11:8 **NUM\_LIT[3:0]**: number of literal address comparators supported (read-only)  
 0x0: no literal comparators supported.

Bits 14:12, 7:4 **NUM\_CODE[6:0]**: instruction address comparator number field  
 This read-only field holds the number of instruction address comparators supported.  
 0x08: height instruction comparators supported  
 Others: reserved

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **KEY**: write protect key

A write to M7\_FPB\_CTRL register is ignored if this bit is not set to 1.

Bit 0 **ENABLE**: FPB enable

0: disabled  
1: enabled

**FPB remap register (M7\_FPB\_REMAP)**

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	RMPSP	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
		r													
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **RMPSP**: Flash patch remap support (read-only)

0: remapping not supported

Bits 28:0 Reserved, must be kept at reset value.

**FPB comparator registers (M7\_FPB\_COMPx)**

Address offset: 0x008 + x \* 0x4 (for x = 0 to 7)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REPLACE[1:0]		Res.	COMP[26:14]												
rW	rW		rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
COMP[13:0]														Res.	ENABLE
rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW	rW		rW

- Bits 31:30 **REPLACE[1:0]**: behavior upon COMP versus instruction fetch address match
  - This field defines the behavior when a match occurs between the COMP field and the instruction fetch address:
  - 0x0: reserved
  - 0x1: breakpoint on lower half-word, upper half-word unaffected
  - 0x2: breakpoint on upper half-word, lower half-word unaffected
  - 0x3: breakpoint on both upper and lower half-words
- Bit 29 Reserved, must be kept at reset value.
- Bits 28:2 **COMP[26:0]**: value to compare with code memory access address
  - Value to compare with address bits 28:2 of accesses to instruction code memory (0x00000000 to 0x1FFFFFFF). If a match occurs, the action to take is defined by the REPLACE field.
- Bit 1 Reserved, must be kept at reset value.
- Bit 0 **ENABLE**: comparator enable
  - The comparator is only enabled if both this bit and the FPB ENABLE bit in the M7\_FPB\_CTRL register are set.
  - 0: disabled
  - 1: enabled

**FPB CoreSight peripheral identity register 4 (M7\_FPB\_PIDR4)**

Address offset: 0xFD0

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 64.6.5 Cortex-M7 embedded trace macrocell (ETM)

The Cortex-M7 ETM is a CoreSight component closely coupled to the CPU. The ETM generates trace packets that allow the execution of the Cortex-M7 core to be traced. In the STM32H7, the ETM is configured for instruction trace only, so data accesses are not included in the trace information.

The ETM receives information from the CPU over the processor trace interface, including:

- the number of instructions executed in the same cycle
- changes in program flow
- the current processor instruction state
- the addresses of memory locations accessed by load and store instructions
- the type, direction and size of a transfer
- condition code information
- exception information
- wait for interrupt state information

For more information, refer to the Arm® CoreSight ETM-M7 technical reference manual [6].

#### Cortex-M7 ETM registers

##### ETM programming control register (M7\_ETM\_PRGCTL)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EN
															rw

Bits 31:1 Reserved, must be kept at reset value.

- Bit 0 **EN**: trace program enable
  - 0: trace unit disabled
  - 1: trace unit enabled

**ETM status register (M7\_ETM\_STAT)**

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PMSTABLE	IDLE
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **PMSTABLE**: programmers model stable

This bit indicates whether the ETM registers are stable and can be read.

0: registers not stable

1: registers stable

Bit 0 **IDLE**: trace unit inactive

0: ETM not idle

1: ETM idle

**ETM trace configuration register (M7\_ETM\_CONFIG)**

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DV	DA
														rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	RS	TS	COND[2:0]			Res.	Res.	Res.	CCI	BB	INSTP0[1:0]		Res.
			rw	rw	rw	rw	rw				rw	rw	r	r	

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **DV**: data value tracing (read-only)

0: disabled

Bit 16 **DA**: data address tracing (read-only)

0: disabled

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **RS**: return stack enable

0: disabled

1: enabled

Bit 11 **TS**: global timestamp tracing  
 0: disabled  
 1: enabled  
 Note: Gglobal timestamp not implemented in this device

Bits 10:8 **COND[2:0]**: conditional instruction tracing  
 0x0: conditional instruction tracing disabled  
 0x1: conditional load instructions traced  
 0x2: conditional store instructions traced  
 0x3: conditional load and store instructions traced  
 0x7: all conditional instructions traced  
 Other: reserved

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **CCI**: cycle counting in instruction trace  
 0: disabled  
 1: enabled

Bit 3 **BB**: branch broadcast mode  
 0: disabled  
 1: enabled

Bits 2:1 **INSTP0[1:0]**: determines which instructions are P0 instructions (read-only)  
 0x0: Only branches are P0 instructions.

Bit 0 Reserved, must be kept at reset value.

**ETM event control 0 register (M7\_ETM\_EVENTCTL0)**

Only accepts writes when trace unit is disabled

Address offset: 0x020

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TYPE1	Res.	Res.	Res.	SEL1[3:0]				TYPE0	Res.	Res.	Res.	SEL0[3:0]			
rw				rw	rw	rw	rw	rw				rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **TYPE1**: resource type for event 1  
 0: single selected resource  
 1: boolean combined resource pair

Bits 14:12 Reserved, must be kept at reset value.

Bits 11:8 **SEL1[3:0]**: resource/boolean combined resource pair, for event 1  
 When TYPE1 is 0, this field selects a single selected resource from 0-15 defined by bits[3:0].  
 When TYPE1 is 1, this field selects a boolean combined resource pair from 0-7 defined by bits[2:0].

Bit 7 **TYPE0**: resource type for event 0  
 0: single selected resource  
 1: boolean combined resource pair

Bits 6:4 Reserved, must be kept at reset value.

Bits 3:0 **SEL0[3:0]**: resource/boolean combined resource pair for event 0  
 When TYPE0 is 0, this field selects a single selected resource from 0-15 defined by bits[3:0].  
 When TYPE0 is 1, this field selects a boolean combined resource pair from 0-7 defined by bits[2:0].

**ETM event control 1 register (M7\_ETM\_EVENTCTL1)**

Only accepts writes when trace unit is disabled

Address offset: 0x024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	LPOVERRIDE	ATB	Res.	Res.	Res.	Res.	Res.	Res.	Res.	INSTEN[3:0]			
			rw	rw								rw	rw	rw	rw

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **LPOVERRIDE**: low-power state behavior override  
 0: low-power state normal behavior  
 1: Entry to low power state does not affect resources and event trace generation.

Bit 11 **ATB**: ATB trigger enable  
 0: disabled  
 1: enabled

Bits 10:4 Reserved, must be kept at reset value.

Bits 3:0 **INSTEN[3:0]**: instruction trace event element enable  
 Each bit corresponds to an event:  
 xxx0: Event 0 does not cause an event element.  
 xxx1: Event 0 causes an event element.  
 xx0x: Event 1 does not cause an event element.  
 xx1x: Event 1 causes an event element.  
 x0xxX: Event 2 does not cause an event element.  
 x1xx: Event 2 causes an event element.  
 0xxx: Event 3 does not cause an event element.  
 1xxx: Event 3 causes an event element.

**ETM stall control register (M7\_ETM\_STALLCTL)**

Only accepts writes when trace unit is disabled

Address offset: 0x02C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	DSTALL	ISTALL	Res.	Res.	Res.	Res.	LEVEL[1:0]		Res.	Res.
						rw	rw					rw	rw		

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **DSTALL**: stalls processor based on data trace buffer space

0: Do not stall processor.

1: Stalls processor.

Bit 8 **ISTALL**: Stalls processor based on instruction trace buffer space

0: Do not stall processor.

1: Stalls processor.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:2 **LEVEL[1:0]**: Stalling threshold level

A low level minimizes the amount of processor stalling, with a higher risk of FIFO overflow. A high level minimizes the risk of FIFO overflow but increases the amount of processor stalling.

Bits 1:0 Reserved, must be kept at reset value.

**ETM synchronization period register (M7\_ETM\_SYNCNP)**

Address offset: 0x034

Reset value: 0x0000 000A

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PERIOD[4:0]				
											r	r	r	r	r

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **PERIOD[4:0]**: trace bytes between synchronization requests

This field defines the number of bytes of trace information between trace synchronization requests.

0xA: 1024 bytes

**ETM cycle count control register (M7\_ETM\_CCCTL)**

Address offset: 0x038

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	THRESHOLD[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **THRESHOLD[11:0]**: threshold value for instruction trace cycle counting  
 The threshold represents the minimum interval between cycle count trace packets.  
 0x0: reserved  
 Others: threshold

**ETM trace ID register (M7\_ETM\_TRACEID)**

Address offset: 0x040

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRACEID[6:0]						
									rw	rw	rw	rw	rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:0 **TRACEID[6:0]**: trace ID  
 0x00: reserved  
 0x01 to 0x6F: valid ID  
 0x70 to 0x7F: reserved

**ETM ViewInst main control register (M7\_ETM\_VICTL)**

Address offset: 0x080

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EXLEVEL_S3	Res.	Res.	EXLEVEL_S0
												rw			rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	TRCERR	TRCRESET	SSSTATUS	Res.	TYPE	Res.	Res.	Res.	SEL[3:0]			
				rw	rw	rw		rw				rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **EXLEVEL\_S3**: trace disable, exception level 3

This bit disables tracing in the specified exception level in Secure state for exception level 3.

0: Enables ViewInst in this exception level.

1: Disables ViewInst in this exception level.

Bits 18:17 Reserved, must be kept at reset value.

Bit 16 **EXLEVEL\_S0**: trace disable, exception level 0

This bit disables tracing in the specified exception level in Secure state for exception level 0.

0: Enables ViewInst in this exception level.

1: Disables ViewInst in this exception level.

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **TRCERR**: tracing of system error exception

This bit selects whether a system error exception must always be traced.

0: System error exception is traced only if the instruction or exception immediately before the system error exception is traced.

1: System error exception is always traced regardless of the value of ViewInst.

Bit 10 **TRCRESET**: tracing of reset exception

This bit selects whether a reset exception must always be traced.

0: Reset exception is traced only if the instruction or exception immediately before the reset exception is traced.

1: Reset exception is always traced regardless of the value of ViewInst.

Bit 9 **SSSTATUS**: current status of the start/stop logic

0: Stop state

1: Started state

Bit 8 Reserved, must be kept at reset value.

Bit 7 **TYPE**: resource type  
 0: single selected resource  
 1: boolean combined resource pair

Bits 6:4 Reserved, must be kept at reset value.

Bits 3:0 **SEL[3:0]**: resource/boolean combined resource pair  
 When TYPE is 0, this field selects a single selected resource from 0-15 defined by bits[3:0].  
 When TYPE is 1, this field selects a boolean combined resource pair from 0-7 defined by bits[2:0].

**ETM ViewInst start/stop control register (M7\_ETM\_VISSCTL)**

Address offset: 0x088

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STOP[7:0]

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	START[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **STOP[7:0]**: selector of single address comparators to stop trace  
 This field defines the single address comparators to stop trace with the ViewInst Start/Stop control. One bit is provided for each implemented single address comparator.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **START[7:0]**: Selector of single address comparators to start trace  
 This field defines the single address comparators to start trace with the ViewInst Start/Stop control. One bit is provided for each implemented single address comparator.

**ETM ViewInst start/stop processor comparator control register (M7\_ETM\_VIPCSSCTL)**

Address offset: 0x08C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STOP[3:0]

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	START[3:0]			
												rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **STOP[3:0]**: selector of processor comparator input to stop trace

This field selects which processor comparator inputs are in use with ViewInst Start/Stop control, for the purpose of stopping trace. One bit is provided for each processor comparator input.

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **START[3:0]**: selector of processor comparator input to start trace

This field selects which processor comparator inputs are in use with ViewInst Start/Stop control, for the purpose of starting trace. One bit is provided for each processor comparator input.

### ETM counter reload value register (M7\_ETM\_CNTRLDV)

Address offset: 0x140

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VALUE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **VALUE[15:0]**: counter reload value

This value is loaded into the counter each time the reload event occurs.

### ETM ID register 8 (M7\_ETM\_IDR8)

Address offset: 0x180

Reset value: 0x0000 0002

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MAXSPEC[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MAXSPEC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **MAXSPEC[31:0]**: maximum speculation depth

This field indicates the maximum speculation depth of the instruction trace stream. This is the maximum number of P0 elements that have not been committed in the trace stream at any one time.

0x2: maximum trace speculation depth is 2

**ETM ID register 9 (M7\_ETM\_IDR9)**

Address offset: 0x184

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
NUMP0KEY[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUMP0KEY[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **NUMP0KEY[31:0]**: number of P0 right-hand keys used  
 0x0: no P0 keys used in instruction trace only configuration

**ETM ID register 10 (M7\_ETM\_IDR10)**

Address offset: 0x188

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
NUMP1KEY[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUMP1KEY[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **NUMP1KEY[31:0]**: total number of P1 right-hand keys  
 This field indicates the total number of P1 right-hand keys, including normal and special keys.  
 0x0: No P1 keys used in instruction trace only configuration

**ETM ID register 11 (M7\_ETM\_IDR11)**

Address offset: 0x18C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
NUMP1SPC[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUMP1SPC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **NUMP1SPC[31:0]**: total number of special P1 right-hand keys used  
 0x0: no special P1 keys used

**ETM ID register 12 (M7\_ETM\_IDR12)**

Address offset: 0x190

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
NUMCONDKEY[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUMCONDKEY[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **NUMCONDKEY[31:0]**:

This field indicates the total number of conditional instruction right-hand keys, including normal and special keys.

0x1: one conditional instruction right hand-key implemented

**ETM ID register 13 (M7\_ETM\_IDR13)**

Address offset: 0x194

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
NUMCONDSPC[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUMCONDSPC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **NUMCONDSPC[31:0]**: number of special conditional instruction right-hand keys

0x0: no special conditional instruction right hand-keys implemented

**ETM implementation specific register 0 (M7\_ETM\_IMSPEC0)**

Address offset: 0x1C0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r		r	r	r		r	r	r								

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **COMMOPT**: meaning of the commit field in some packets  
 0: commit mode 0

Bits 28:24 **TSSIZE[4:0]**: global timestamp size  
 0x08: maximum of 64-bit global timestamp implemented.  
 Note: global timestamp not implemented in this device

Bits 23:17 Reserved, must be kept at reset value.

Bits 16:15 **QSUPP[1:0]**: Q element support  
 0x0: Q elements not supported

Bit 14 Reserved, must be kept at reset value.

Bits 13:12 **CONDTYPE[1:0]**: way of conditional result tracing  
 0x1: APSR condition flag values traced

Bits 11:10 **NUMEVENT[1:0]**: number of events supported in the trace  
 0x1: two events supported for instruction only configuration

Bit 9 **RETSTACK**: return stack support  
 1: two entry return stack supported

Bit 8 Reserved, must be kept at reset value.

Bit 7 **TRCCCI**: support for cycle counting in the instruction trace  
 1: cycle counting in the instruction trace implemented

Bit 6 **TRCCOND**: support for conditional instruction tracing  
 1: conditional instruction trace implemented

Bit 5 **TRCBB**: support for branch broadcast tracing  
 1: branch broadcast trace implemented

Bits 4:0 Reserved, must be kept at reset value.

**ETM ID register 1 (M7\_ETM\_IDR1)**

Address offset: 0x1E4

Reset value: 0x4100 F401

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:25 **CCSIZE[3:0]**: cycle counter size

This field indicates the size of the cycle counter in bits minus 12.  
0x0: Cycle counter is 12 bits.

Bits 24:20 **DVSIZE[4:0]**: data value size in bytes

0x0: Data value size is not supported in instruction only configuration.

Bits 19:15 **DASIZE[4:0]**: data address size in bytes

0x0: Data address size is not supported in instruction only configuration.

Bits 14:10 **VMIDSIZE[4:0]**: virtual machine ID size

0x0: virtual machine ID tracing not implemented

Bits 9:5 **CIDSIZE[4:0]**: context ID size

0x0: context ID tracing not implemented

Bits 4:0 **IASIZE[4:0]**: instruction address size

0x4: 32-bit maximum address size

### ETM ID register 3 (M7\_ETM\_IDR3)

Address offset: 0x1EC

Reset value: 0x0509 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	CCITMIN[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bit 31 **NOOVERFLOW**: support of NOOVERFLOW

This bit indicates whether the NOOVERFLOW of trace stall control is implemented.  
0: not implemented

Bits 30:28 **NUMPROC[2:0]**: number of processors available for tracing

0x0: Only one processor can be traced.

Bit 27 **SYSSTALL**: system support for stall control of the processor

0: not supported

Bit 26 **STALLCTL**: stall control support

1: trace stall control (TRCSTALLCTLR) implemented

Bit 25 **SYNCP**: trace synchronization period support

0: TRCSYNCP is read-only for instruction trace only configuration; the trace synchronization period is fixed.

Bit 24 **TRCERR**: support of TRCVICTLR.TRCERR  
 This bit indicates whether TRCVICTLR.TRCERR is implemented.  
 0x4: 32-bit maximum address size

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **EXLEVEL\_S[3:0]**: support of privilege levels  
 Privilege levels are implemented; one bit for each level.  
 0x9: privilege levels thread and handler implemented

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **CCITMIN[11:0]**: instruction trace cycle counting minimum threshold  
 0x4: Minimum threshold is 4 instruction trace cycle.

**ETM ID register 4 (M7\_ETM\_IDR4)**

Address offset: 0x1F0

Reset value: 0x0001 4000

								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **PAIRINV**: inversion of result of a combined pair of resources  
 0: not inverted  
 1: inverted

Bit 20 **INV**: inversion of the selected resources  
 0: not inverted  
 1: inverted

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **GROUP[2:0]**: selects a group of resources

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **SELECT[7:0]**: selector of resources from desired group  
 This field selects one or more resources from the desired group. One bit is provided per resource from the group.

**ETM resource selection register 3 (M7\_ETM\_RSCTL3)**

Address offset: 0x20C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **RST**: single-shot comparator resource reset enable

This bit enables the single-shot comparator resource to be reset when it occurs, to enable another comparator match to be detected.

0: disabled

1: reset enabled; multiple matches can occur.

Bits 23:0 Reserved, must be kept at reset value.

**ETM single-shot comparator status register 0 (M7\_ETM\_SSCS0)**

Address offset: 0x2A0

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DV	DA	INST
													r	r	r

Bit 31 **STATUS**: single-shot status

This bit indicates whether any of the selected comparators have matched. If SSSC0.RST is set to 0, the STATUS bit must be written with 0 in order to enable single-shot comparator control.

- 0: no match occurred
- 1: match occurred at least once

Bits 30:3 Reserved, must be kept at reset value.

Bit 2 **DV**: data value comparator support

- 0: single-shot data value comparisons not supported

Bit 1 **DA**: data address comparator support

- 0: single-shot data address comparisons not supported

Bit 0 **INST**: instruction address comparator support

- 1: single-shot instruction address comparisons supported

**ETM single-shot processor comparator input control register (M7\_ETM\_SSPCIC0)**

Address offset: 0x2C0

Reset value: 0x0000 0000

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PC[7:0]									
								rw	rw	rw	rw	rw	rw	rw	rw		

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PC[7:0]**: comparator input selector for single-shot control

This field selects one or more processor comparator inputs for single-shot control. One bit is provided for each processor comparator input.

**ETM power-down control register (M7\_ETM\_PDC)**

Address offset: 0x310

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PU	Res.	Res.	Res.
												r			

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **PU**: power up request

Request to maintain power to the ETM and access to the trace registers.

0: power not requested

1: power requested

Bits 2:0 Reserved, must be kept at reset value.

**ETM power-down status register (M7\_ETM\_PDS)**

Address offset: 0x314

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STICKYPD	POWER
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **STICKYPD**: Sticky power-down state

This bit is set to 1 when power to the ETM registers is removed, to indicate that programming state has been lost. It is cleared after a read of the TRCPDSR.

0: trace register power uninterrupted since the last read of PDS register

1: trace register power interrupted since the last read of PDS register

Bit 0 **POWER**: ETM powered up

1: ETM is powered up; all registers are accessible.

**ETM claim tag set register (M7\_ETM\_CLAIMSET)**

Address offset: 0xFA0

Reset value: 0x0000 000F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMSET[3:0]			
													r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: Sets claim tag bits

Write:

0000: no effect

xxx1: Sets bit 0.

xx1x: Sets bit 1.

x1xx: Sets bit 2.

1xxx: Sets bit 3.

Read:

0xF: Indicates there are four bits in claim tag.

**ETM claim tag clear register (M7\_ETM\_CLAIMCLR)**

Address offset: 0xFA4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLAIMCLR[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: Resets claim tag bits

Write:

0000: no effect

xxx1: Clears bit 0.

xx1x: Clears bit 1.

x1xx: Clears bit 2.

1xxx: Clears bit 3.

Read: Returns current value of claim tag.

**ETM lock access register (M7\_ETM\_LAR)**

Address offset: 0xFB0

Reset value: 0xFFFF XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ACCESS_W[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ACCESS_W[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **ACCESS\_W[31:0]**: ETM register write access

This field enables write access to some ETM registers by processor cores (debuggers do not need to unlock the component)

0xC5ACCE55: write access enabled

Other values: write access disabled

**ETM lock status register (M7\_ETM\_LSR)**

Address offset: 0xFB4

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCKTYPE	LOCKGRANT	LOCKEXIST
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: size of the M7\_ETM\_LAR register  
0: 32-bit

Bit 1 **LOCKGRANT**: current status of lock  
This bit always returns zero when read by an external debugger.  
0: Write access permitted  
1: Write access blocked. Only read access is permitted.

Bit 0 **LOCKEXIST**: existence of lock control mechanism  
The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.  
0: no lock control mechanism  
1: lock control mechanism implemented

**ETM authentication status register (M7\_ETM\_AUTHSTAT)**

Address offset: 0xFB8

Reset value: 0x0000 000A

								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: security level for secure non-invasive debug  
 0x0: not implemented

Bits 5:4 **SID[1:0]**: security level for secure invasive debug  
 0x0: not implemented

Bits 3:2 **NSNID[1:0]**: security level for non-secure non-invasive debug  
 0x2: disabled  
 0x3: enabled

Bits 1:0 **NSID[1:0]**: security level for non-secure invasive debug  
 0x2: disabled  
 0x3: enabled

**ETM CoreSight device architecture register (M7\_ETM\_DEVARCH)**

Address offset: 0xFBC

Reset value: 0x4770 4A13

Bits 31:21 **ARCHITECT[10:0]**: component architect  
 0x23B: Arm®

Bit 20 **PRESENT**: indicates the presence of this register  
 1: present

Bits 19:16 **REVISION[3:0]**: architecture revision  
 0x0: rev 0

Bits 15:0 **ARCHID[15:0]**: architecture ID  
 0x4A13: ETMv4 component

**ETM CoreSight device type identity register (M7\_ETM\_DEVTYPE)**

Address offset: 0xFCC

Reset value: 0x0000 0013

## 65 Device electronic signature

The electronic signature is stored in the Flash memory area. It can be read using the JTAG/SWD or the CPU. It contains factory-programmed identification data that allow the user firmware or other external devices to automatically match its interface to the characteristics of the STM32H7A3/7B3/7B0xx microcontrollers.

### 65.1 Unique device ID register (96 bits)

The unique device identifier is ideally suited:

- for use as serial numbers (for example USB string serial numbers or other end applications)
- for use as security keys in order to increase the security of code in Flash memory while using and combining this unique ID with software cryptographic primitives and protocols before programming the internal Flash memory
- to activate secure boot processes, etc.

The 96-bit unique device identifier provides a reference number which is unique for any device and in any context. These bits can never be altered by the user.

The 96-bit unique device identifier can also be read in single bytes/half-words/words in different ways and then be concatenated using a custom algorithm.

**Base address: 0x08FF F800**

Address offset: 0x00

Read only = 0xXXXX XXXX where X is factory-programmed

Bits 31:0 **U\_ID(31:0)**: 31:0 unique ID bits

Address offset: 0x04

Read only = 0xXXXX XXXX where X is factory-programmed

Bits 31:0 **U\_ID(63:32)**: 63:32 unique ID bits

Address offset: 0x08

Read only = 0xXXXX XXXX where X is factory-programmed

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
U_ID(95:80)															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
U_ID(79:64)															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **U\_ID(95:64)**: 95:64 Unique ID bits.

### 65.2 Flash size

Base address: 0x08FF F80C

Address offset: 0x00

Read only = 0xXXXX where X is factory-programmed

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
F_SIZE															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **F\_ID(15:0)**: Flash memory size

This bitfield indicates the size of the device Flash memory expressed in Kbytes.  
As an example, 0x0400 corresponds to 1024 Kbytes.

### 65.3 Package data register

Base address: 0x08FF F80E

Address offset: 0x00

Read only = 0xXXXX where X is factory-programmed

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PKG[3:0]			
												r	r	r	r

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **PKG[3:0]**: Package

- 0000: LQFP64
- 0001: TFBGA100/LQFP100
- 0010: LQFP100 devices with SMPS
- 0011: TFBGA100 devices with SMPS
- 0100: WLCSP132 devices with SMPS
- 0101: LQFP144
- 0110: LQFP144 devices with SMPS
- 0111: UFBGA169
- 1000: UFBGA176/LQFP176
- 1001: LQFP176 devices with SMPS
- 1010: UFBGA176 devices with SMPS
- 1100: TFBGA216
- 1110: TFBGA225
- Others: Reserved

## 66 Important security notice

The STMicroelectronics group of companies (ST) places a high value on product security, which is why the ST product(s) identified in this documentation may be certified by various security certification bodies and/or may implement our own security measures as set forth herein. However, no level of security certification and/or built-in security measures can guarantee that ST products are resistant to all forms of attacks. As such, it is the responsibility of each of ST's customers to determine if the level of security provided in an ST product meets the customer needs both in relation to the ST product alone, as well as when combined with other components and/or software for the customer end product or application. In particular, take note that:

- ST products may have been certified by one or more security certification bodies, such as Platform Security Architecture ([www.psacertified.org](http://www.psacertified.org)) and/or Security Evaluation standard for IoT Platforms ([www.trustcb.com](http://www.trustcb.com)). For details concerning whether the ST product(s) referenced herein have received security certification along with the level and current status of such certification, either visit the relevant certification standards website or go to the relevant product page on [www.st.com](http://www.st.com) for the most up to date information. As the status and/or level of security certification for an ST product can change from time to time, customers should re-check security certification status/level as needed. If an ST product is not shown to be certified under a particular security standard, customers should not assume it is certified.
- Certification bodies have the right to evaluate, grant and revoke security certification in relation to ST products. These certification bodies are therefore independently responsible for granting or revoking security certification for an ST product, and ST does not take any responsibility for mistakes, evaluations, assessments, testing, or other activity carried out by the certification body with respect to any ST product.
- Industry-based cryptographic algorithms (such as AES, DES, or MD5) and other open standard technologies which may be used in conjunction with an ST product are based on standards which were not developed by ST. ST does not take responsibility for any flaws in such cryptographic algorithms or open technologies or for any methods which have been or may be developed to bypass, decrypt or crack such algorithms or technologies.
- While robust security testing may be done, no level of certification can absolutely guarantee protections against all attacks, including, for example, against advanced attacks which have not been tested for, against new or unidentified forms of attack, or against any form of attack when using an ST product outside of its specification or intended use, or in conjunction with other components or software which are used by customer to create their end product or application. ST is not responsible for resistance against such attacks. As such, regardless of the incorporated security features and/or any information or support that may be provided by ST, each customer is solely responsible for determining if the level of attacks tested for meets their needs, both in relation to the ST product alone and when incorporated into a customer end product or application.
- All security features of ST products (inclusive of any hardware, software, documentation, and the like), including but not limited to any enhanced security features added by ST, are provided on an "AS IS" BASIS. AS SUCH, TO THE EXTENT PERMITTED BY APPLICABLE LAW, ST DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, unless the applicable written and signed contract terms specifically provide otherwise.

## 67 Revision history

**Table 549. Document revision history**

Date	Revision	Changes
20-Nov-2018	1	Initial release.
04-Dec-2018	2	<p><b>Section 12: System configuration controller (SYSCFG)</b>            Added <a href="#">Section 12.3.1: Analog switch configuration management</a>, <a href="#">Section 12.3.2: I2C Fm+ configuration</a>, <a href="#">Section 12.3.4: Management of external interrupt line connections to GPIOs</a> and <a href="#">Section 12.3.5: I/O speed in low-voltage mode</a>.  <a href="#">SYSCFG peripheral mode configuration register (SYSCFG_PMCR)</a>:            – Updated reset value.            – Updated PBxFMP and I2CxFMP descriptions</p> <p><b>Section 38: True random number generator (RNG)</b>            Corrected section numbering.</p> <p><b>Section 43: General-purpose timers (TIM2/TIM3/TIM4/TIM5)</b>            Removed all information related to BDTR register, MOE and OSSSI bits. Updated <a href="#">Figure 402: Output stage of Capture/Compare channel (channel 1)</a>.</p> <p><b>Section 45: General-purpose timers (TIM15/TIM16/TIM17)</b>            Changed COMDE of TIMx_DIER for TIM16/17 to reserved.</p> <p><b>Section 52: Inter-integrated circuit (I2C) interface</b>            Swapped I2C_SDA and I2C_SCL definition in <a href="#">Table 369: I2C input/output pins</a>.</p>

Table 549. Document revision history (continued)

Date	Revision	Changes
23-Jan-2020	3	<p>Changed document classification to public.  Added support for STM32H7B0 Value line.  Updated <a href="#">Figure 1: System architecture for STM32H7A3/7B3/7B0xx devices</a>, <a href="#">Table 7: Register boundary addresses</a>. Updated USART3 pins and added FDCAN1 in <a href="#">Section : Embedded bootloader</a>.</p> <p><b>Section 4: Embedded flash memory (FLASH)</b>  Whole section updated to support STM32H7B0 and STM32H7A3xG. Specified that the Secure access mode is available only on STM32H7B0 and STM32H7B3 devices.  In <a href="#">Table 26: Effect of low-power modes on the embedded flash memory</a>, added VOS0 in the list of voltage ranges applicable for Run mode.  Updated <a href="#">Figure 8: Embedded flash memory usage</a>.  <a href="#">Section : Adjusting programming timing constraints</a>: added note related to WRHIGHFREQ modification during Flash memory programming/erasing.  Updated BOR option byte default value when the devices are delivered by STMicroelectronics in <a href="#">Section 4.4.5: Description of user and system option bytes</a>.  <a href="#">Section 4.4.6: Description of data protection option bytes</a>  Secure DTCM size (ST_RAM_SIZE):  – Removed Secure DTCM size (ST_RAM_SIZE) from <a href="#">Section : Changing user option bytes</a>.  – Changed <i>Default factory value to 11</i> in <a href="#">Table 21: Option byte organization</a>.  – Updated ST_RAM_SIZE description and added ST_RAM_SIZE to the values programmed in the data protection option bytes in <a href="#">Section 4.4.6: Description of data protection option bytes</a>.</p> <p>Updated <a href="#">Table 16: FLASH recommended number of wait states and programming delay</a>.  <a href="#">Section : Definitions of RDP global protection level</a>: updated description of RDP level 1 to 0 regression and RDP level 2. <a href="#">Section : RDP protection transitions</a>: user Flash memory can be partially or mass erased when doing a level regression from RDP level 1 to 0.  In <a href="#">Section 4.9.8: FLASH option status register (FLASH_OPTSR_CUR)</a> and <a href="#">Section 4.9.9: FLASH option status register (FLASH_OPTSR_PRG)</a>:  – added note related to the availability of the whole DTCM RAM regardless of ST_RAM_SIZE configuration of FLASH_OPTSR_CUR/PRG.  – Updated BOV_LEV 00 configuration in FLASH_OPTSR_CUR/PRG.</p> <p>Restored <a href="#">Section 4.9.17: FLASH register boot address (FLASH_BOOT_CURR)</a> and <a href="#">Section 4.9.18: FLASH register boot address FLASH_BOOT_PRGR</a> register descriptions and renamed BOOT_CM_ADD01/ into BOOT_ADD0/1 in the whole document.</p> <p><b>Section 5: Secure memory management (SMM)</b> (former Secure internal Flash memory)  Added STM32H7B0 devices and specified that the Secure access mode is not available on STM32H7A3.  Changed SIFM domain from D1 to CD in <a href="#">Section 5.1: Introduction</a>.  Added note related to HDP in <a href="#">Table 29: List of preferred terms</a>.  Updated <a href="#">Figure 15: Flash memory areas and services in Standard and Secure access modes</a> and Removed note related to secure user area.  Updated <a href="#">Section 5.4.2: Secure area exiting service</a>.  Added <a href="#">Section 5.4.3: OTFDEC encryption service</a>.</p>

Table 549. Document revision history (continued)

Date	Revision	Changes
23-Jan-2020	3 (continued)	<p><b>Section 6: Power control (PWR)</b>  Added PDV_IN to <i>Figure 18: Power control block diagram</i>, and <i>Table 32: PWR input/output signals connected to package pins or balls</i>.  Replaced RC48 by HSI48 in <i>Figure 19: Power supply overview</i>.  In <i>Section 6.4.5: Backup domain</i>, removed PC1 from the list of functions available in V<sub>BAT</sub> mode when the V<sub>DD</sub> supply is absent and a supply is present on VBAT.  Replaced PDR by POR/PDR in <i>Section 6.5.1: Power-on reset (POR)/power-down reset (PDR)</i>.  Removed reference to V<sub>BOR0</sub> for BOR off in <i>Section 6.5.2: Brownout reset (BOR)</i>.  Updated <i>Section 6.5.5: Battery voltage thresholds</i> and <i>Section 6.7.7: DStop and DStop2 modes</i>.  Added GFXSO bit (position 25) and update FLPS bit description in <i>Section 6.8.1: PWR control register 1 (PWR_CR1)</i>.  Changed VBATH/L bits to reserved in <i>Section 6.8.3: PWR control register 2 (PWR_CR2)</i>.</p> <p><b>Section 7: Low-power SRD domain application example</b>  Replaced LINUART1 by LPUART1.  Updated <i>Figure 41: Timing diagram of SRD SRAM-to-LPUART1 transfer with BDMA2 and SRD domain in Autonomous mode</i>.  Updated <i>Section : EXTI programming</i>.  Updated DMAMUX2_C0CR value for DMAMUX2 SYNC0 in <i>Table 48: BDMA2 and DMAMUX2 initialization sequence (DMAMUX2_INIT)</i>.  Renamed <i>Table 50</i> into "LPUART1 start programming".</p> <p><b>Section 8: Reset and clock control (RCC)</b>  Replace rc48_ck by hsi48_ck in <i>Figure 47: Top-level clock tree</i> and <i>Figure 61: Kernel clock distribution for USB (2)</i>. Updated <i>Figure 48: HSE/LSE clock source</i> and <i>Figure 55: Kernel clock distribution for SAI, DFSDMs and SPDIFRX</i>.  Updated maximum VCO range in <i>Figure 52: PLL block diagram</i>, PLL3VCOSEL, PLL2VCOSEL and PLL1VCOSEL of <i>RCC PLLs configuration register (RCC_PLL-CFGR)</i>, in DIVN1/2/3[8:0] of <i>RCC PLL1 dividers configuration register (RCC_PLL1DIVR)/RCC PLL2 dividers configuration register (RCC_PLL2DIVR)/RCC PLL3 dividers configuration register (RCC_PLL3DIVR)</i> and FRACN1/2/3[12:0] of <i>RCC PLL1 fractional divider register (RCC_PLL1FRACR)/RCC PLL2 fractional divider register (RCC_PLL2FRACR)/RCC PLL3 fractional divider register (RCC_PLL3FRACR)</i>.  Changed sys_ck_cpu and sys_ck_bus max frequency to 280 MHz in <i>Figure 54: Core and bus clock generation</i>.  In <i>Table 58: Kernel clock distribution overview</i>, updated DAC1. removed note 6 and changed DFSDM to DFSDM2 in note 7 related to SPI6 maximum frequency.  Updated <i>Figure 62: Kernel clock distribution for ADCs, SWPMI, RNG and FDCANs</i>.  Updated CPUCKRDY bit description in <i>RCC source control register (RCC_CR)</i>.  Updated TIMPRE bit description in <i>RCC clock configuration register (RCC_CFGR)</i>.  Replaced DCMIRST by DCMI_PSSIRST in <i>RCC AHB2 peripheral reset register (RCC_AHB2RSTR)</i>, DCMIEN by DCMI_PSSIEN in <i>RCC AHB2 clock register (RCC_AHB2ENR)</i>, DCMILPEN by DCMI_PSSILPEN in <i>RCC AHB2 sleep clock register (RCC_AHB2LPENR)</i> and TMPSENSLPEN by DTSLPEN in <i>RCC APB4 sleep clock register (RCC_APB4LPENR)</i>.</p>

Table 549. Document revision history (continued)

Date	Revision	Changes
23-Jan-2020	3 (continued)	<p><b>Section 8: Reset and clock control (RCC) (continued)</b>  Replaced TMPSENSRST by DTSRST in <i>RCC APB4 peripheral reset register (RCC_APB4RSTR)</i>, TMPSENSAMEN by DTSAMEN in <i>RCC SmartRun domain Autonomous mode register (RCC_SRDAMR)</i> and TMPSENSEN by DTSEN in <i>RCC APB4 clock register (RCC_APB4ENR)</i>.</p> <p><b>Section 9: Clock recovery system (CRS)</b>  Added <i>Section 9.3: CRS implementation</i>.  Updated <i>Section 9.8.1: CRS control register (CRS_CR)</i> and <i>Table 68: CRS register map and reset values</i>.</p> <p><b>Section 12: System configuration controller (SYSCFG)</b>  Added <i>Section 12.3.1: Analog switch configuration management</i>, <i>Section 12.3.2: I2C Fm+ configuration</i>, <i>Section 12.3.4: Management of external interrupt line connections to GPIOs</i> and <i>Section 12.3.5: I/O speed in low-voltage mode</i>.  Updated reset value and PBxFMP and I2Cx FMP descriptions in <i>SYSCFG peripheral mode configuration register (SYSCFG_PMCR)</i>.  Renamed SYSCFG_BRK_LOCKUPR into SYSCFG_CFRG.</p> <p><b>Section 13: Block interconnect</b>  Renamed DCMI to DCMI_PSSI in <i>Table 81: DMAMUX1, DMA1, DMA2 and BDMA1 connections</i>.</p> <p><b>Section 14: MDMA controller (MDMA)</b>  Updated number of hardware trigger sources in <i>Section 14.2: MDMA main features</i>.  Updated <i>Figure 82: MDMA block diagram</i>.</p> <p><b>Section 16: Basic direct memory access controller (BDMA)</b>  Added “Channel state and disabling channel” sub-part in <i>Section 16.4.5: BDMA channels</i>.</p> <p><b>Section 19: Nested vectored interrupt controller (NVIC)</b>  Replaced DCMI by DCMI/PSSI and added cpu_fpu_it (position 81) in <i>Table 123: NVIC</i>.</p> <p><b>Section 20: Extended interrupt and event controller (EXTI)</b>  Removed HSEM and Cortex-M7 SEV interrupts in <i>Table 126: EXTI Event input mapping</i>.</p> <p><b>Section 23: Flexible memory controller (FMC)</b>  Replaced BCH8 by Hamming in <i>Section 23.8.6: Computation of the error correction code (ECC) in NAND flash memory</i>  Updated <i>Figure 119: Mode D write access waveforms</i>.  Replaced FMC_CLK by fmc_ker_ck in the formulas of <i>Section : Wait management</i>.</p>

**Table 549. Document revision history (continued)**

Date	Revision	Changes
23-Jan-2020	3 (continued)	<p><b>Section 24: Octo-SPI interface (OCTOSPI)</b>  <i>Section 24.4.10: OCTOSPI Memory-mapped mode</i>: removed timeout from the list of events triggering BUSY fall; removed mention that Memory-mapped write operations are not supported on memories without write strobe or in Dual-quad mode in <i>Section : Memory-mapped mode configuration</i>.                      Updated <i>Section : Sending the instruction only once (SIOO)</i>.                      Updated WRAP support subsection in <i>Section 24.4.6: Specific features</i>.                      Updated ABORT, EN and FTHRES[4:0] descriptions in <i>Section 24.7.1: OCTOSPI control register (OCTOSPI_CR)</i>, DLYBYP bit in <i>Section 24.7.2: OCTOSPI device configuration register 1 (OCTOSPI_DCR1)</i> and FLEVEL description in <i>Section 24.7.6: OCTOSPI status register (OCTOSPI_SR)</i>.</p> <p><b>Section 25: OCTOSPI I/O manager (OCTOSPIM)</b>                      Updated <i>Section 25.4.4: OCTOSPIM multiplexed mode</i>.</p> <p><b>Section 27: Analog-to-digital converters (ADC)</b>                      Removed VREF+ and VREF- ranges and added adc_sclk in <i>Table 189: ADC input/output pins</i>.                      Added reference to LDORDY bit in the whole section.                      Added LDO voltage regulator and replaced SMPPLUS control by Extended sample time option (SMPPLUS control) in <i>Section 27.3: ADC implementation</i>.                      Added adc_sclk in <i>Figure 155: ADC block diagram</i>.                      Updated <i>Section 27.4.3: ADC clocks</i>. Renamed adc_ker_ck into adc_ker_ck_inputs.                      Updated <i>Section : BOOST control</i>.                      Changed BOOSTE bit register to PWR_CR1 in <i>Section : I/O analog switches voltage booster</i>.                      Updated <i>Figure 157: ADC1 connectivity</i> and <i>Figure 158: ADC2 connectivity</i>.                      Changed TIMx_CCy into TIMx_OCy and all source names put in low-case in <i>Section 27.4.19: Conversion on external trigger and trigger polarity (EXTSEL, EXTEN, JEXTSEL, JEXTEN)</i>.                      Updated <i>Section : Single ADC operating modes support when oversampling</i> to remove the mention that the offset correction is not supported in oversampling mode.                      Updated ADC input channel to which VBAT supply is connected in <i>Section 27.4.34: VBAT supply monitoring</i>.                      Updated RES[2:0] bitfield definition in <i>Section 27.6.4: ADC configuration register (ADC_CFGR)</i>.                      Updated LSHIFT[3:0] "Shift left 14-bits" configuration in <i>Section 27.6.5: ADC configuration register 2 (ADC_CFGR2)</i> register.                      Updated <i>Section 27.6.26: ADC calibration factors register (ADC_CALFACT)</i> register.                      Renamed VSENSEEN into TSEN in <i>Section 27.7.2: ADC x common control register (ADCx_CCR) (x=1/2)</i>.                      Replaced adc_hclk by adc_hclk in CKMODE[1:0] bitfield definition of <i>Section 27.7.2: ADC x common control register (ADCx_CCR) (x=1/2)</i>.</p>

Table 549. Document revision history (continued)

Date	Revision	Changes
23-Jan-2020	3 (continued)	<p><b>Section 28: Digital temperature sensor (DTS)</b>  Changed title to “Digital temperature sensor”.  Removed all information related to quick measurement mode.  Removed EN pin and Q_MEAS_opt from <a href="#">Figure 225: Temperature sensor functional block diagram</a>.  Updated <a href="#">Table 210: Trigger configuration</a>.  Updated formulas to calculate the temperature in <a href="#">Section 28.3.7: Temperature measurement principles</a>.  Removed startup time value from <a href="#">Section 28.3.10: On-off control and ready flag</a>  Updated bitfield descriptions in <a href="#">Section 28.6.5: Temperature sensor data register (DTS_DR)</a>.  Removed TS1_EN and updated TS1_INTRIG_SEL[3:0] to replace the list of triggers by a reference to <a href="#">Table Trigger configuration</a> in <a href="#">Section 28.6.1: Temperature sensor configuration register 1 (DTS_CFGR1)</a>.  Changed DTS_OR bitfield names to uppercase (TS_opn into TS_OPn).</p> <p><b>Section 29: Digital-to-analog converter (DAC)</b>  Updated <a href="#">Section 29.3: DAC implementation</a>.  Renamed internal signals:  – Replaced sample and hold clock by dac_hold_ck.  – Changed dac_chx_trg[0:15] into dac_chx_trg[1:15].  – Updated TSELx bitfield description in DAC_CR register to add the correspondence between TSELx configurations and dac_chx_trgy.  Updated <a href="#">Figure 229: Dual-channel DAC block diagram</a>.  Updated <a href="#">Section 29.3: DAC implementation</a>.  Added <a href="#">Table 217: DAC1 interconnection</a> and <a href="#">Table 218: DAC2 interconnection</a> in <a href="#">Section 29.4.2: DAC pins and internal signals</a> and replaced ck_lsi by lsi_ck.  Updated <a href="#">Figure 232: Timing diagram for conversion with trigger disabled TEN = 0</a>.  Updated <a href="#">Section : Sample and hold mode</a> to indicate that the lsi_ck/lse_ck (when available) must not be stopped when Sample and hold mode enabled.  Removed Trigger selection tables from <a href="#">Section 29.4.7: DAC trigger selection</a>.  Updated supply voltages in <a href="#">Section 29.4.12: DAC channel buffer calibration</a>.  Updated CStop mode description for DAC2 in <a href="#">Section 29.5: DAC in low-power modes</a>.  Updated <a href="#">Section 29.6: DAC interrupts</a>.</p> <p><b>Section 33: Digital filter for sigma delta modulators (DFSDM)</b>  Updated <a href="#">Section 33.7: DFSDM channel y registers (y=0..7)</a>.  Updated <a href="#">Section 33.7.5: DFSDM channel y data input register (DFSDM_CHyDATINR)</a>.  Updated <a href="#">Section 33.8: DFSDM filter x module registers (x=0..7)</a>.</p> <p><b>Section 30: Voltage reference buffer (VREFBUF)</b>  Updated supported voltages in <a href="#">Section 30.2: VREFBUF functional description</a>.</p> <p><b>Section 34: Digital camera interface (DCMI)</b>  Updated pin names in <a href="#">Section 34.3: DCMI functional description</a>.</p>

**Table 549. Document revision history (continued)**

Date	Revision	Changes
23-Jan-2020	3 (continued)	<p><b>Section 38: True random number generator (RNG)</b>  Updated <a href="#">Section 38.1: Introduction</a> and <a href="#">Section 38.2: RNG main features</a>.  Updated <a href="#">Figure 280: RNG block diagram</a> and <a href="#">Table 279: RNG internal input/output signals</a>.  Updated <a href="#">Section 38.4: RNG interrupts</a>.  Renamed NISTN by NISTC.  Updated <a href="#">Section 38.3.3: Random number generation</a> and <a href="#">Figure 281: NIST SP800-90B entropy source model</a>.  Updated note in <a href="#">Section 38.3.5: RNG operation</a>.  Updated <a href="#">Section 38.4: RNG interrupts</a>, <a href="#">Section 38.5: RNG processing time</a>, and <a href="#">Section 38.6: RNG entropy source validation</a> and in particular <a href="#">Table 281: RNG configurations</a> and <a href="#">Section 38.6.3: Data collection</a>.  Updated <a href="#">Section 38.7.3: RNG data register (RNG_DR)</a>.  Added note in <a href="#">Section 38.7.4: RNG health test control register (RNG_HTCR)</a>.</p> <p><b>Section 39: Cryptographic processor (CRYP)</b>  Updated number of clock cycles for TDES in <a href="#">Section 39.2: CRYP main features</a>.  Updated <a href="#">Table 291: Key endianness in CRYP_KxR/LR registers (DES K1 and TDES K1/2/3)</a>.  Updated <a href="#">Section 39.4.17: CRYP key registers</a>.  Updated <a href="#">Table 291: Key endianness in CRYP_KxR/LR registers (DES K1 and TDES K1/2/3)</a>.  <a href="#">Section 39.5: CRYP interrupts</a>: removed CRYP interrupt mapping diagram and updated <a href="#">Table 296: CRYP interrupt requests</a>.  <a href="#">Section 39.6: CRYP processing time</a>: updated <a href="#">Table 297: Processing latency for ECB, CBC and CTR</a> and <a href="#">Table 298: Processing time (in clock cycle) for GCM and CCM per 128-bit block</a>.</p> <p><b>Section 40: Hash processor (HASH)</b>  Removed MDMA feature.  Message size changed to <math>2^{64}-1</math> in <a href="#">Section 40.1: Introduction</a> and <a href="#">Section 40.4.3: About secure hash algorithms</a>.  Added <a href="#">Section 40.3: HASH implementation</a>.  Simplified <a href="#">Figure 307: HASH block diagram</a> and renamed hash_in_dma internal signal into hash_dma.  Updated <a href="#">Figure 308: Message data swapping feature</a>.  Updated <a href="#">Section 40.4.8: HASH suspend/resume operations</a>.  Renamed the HASH_HR<sub>x</sub> registers located at address offset 0x0C into HASH_HR<sub>AX</sub>.  Specified value returned by reading <a href="#">HASH data input register (HASH_DIN)</a>.  Updated ALGO description in <a href="#">HASH control register (HASH_CR)</a>.</p> <p><b>Section 41: On-The-Fly decryption engine - AXI (OTFDEC)</b>  Modified <a href="#">Figure 311: Typical OTFDEC usage in the device</a>.  Replaced “Flash memory” with “external read-only memory” and of “SPI NOR Controller” with “external memory controller in the whole document”.  Modified <a href="#">Section 41.5.3: Encrypting for OTFDEC</a>.</p>

Table 549. Document revision history (continued)

Date	Revision	Changes
23-Jan-2020	3 (continued)	<p><b>Section 42: Advanced-control timers (TIM1/TIM8)</b>  Updated <a href="#">Figure 315: Advanced-control timer block diagram</a>.  Updated <a href="#">Section 42.3.3: Repetition counter</a>.  Updated <a href="#">Section 42.3.16: Using the break function</a> and <a href="#">Figure 358: Break and Break2 circuitry overview</a>. Updated <a href="#">Section 42.3.29: Debug mode</a>  Updated <a href="#">Section 42.4.2: TIMx control register 2 (TIMx_CR2)(x = 1, 8)</a>.  Aligned TS[2:0] field in <a href="#">Section 42.4.3: TIMx slave mode control register (TIMx_SMCR)(x = 1, 8)</a>. Updated <a href="#">Section 42.4.5: TIMx status register (TIMx_SR)(x = 1, 8)</a>, <a href="#">Section 42.4.6: TIMx event generation register (TIMx_EGR)(x = 1, 8)</a>. Updated <a href="#">Table 313: TIM1 register map and reset values</a> and <a href="#">Table 314: TIM8 register map and reset values</a>.</p> <p><b>Section 43: General-purpose timers (TIM2/TIM3/TIM4/TIM5)</b>  Updated <a href="#">Figure 375: General-purpose timer block diagram</a>.  Updated <a href="#">Section : External clock source mode 2</a>.  Updated <a href="#">Figure 402: Output stage of Capture/Compare channel (channel 1)</a>.  Updated <a href="#">Section 43.4.2: TIMx control register 2 (TIMx_CR2)(x = 2 to 5)</a>, <a href="#">Section 43.4.5: TIMx status register (TIMx_SR)(x = 2 to 5)</a>, <a href="#">Section 43.4.11: TIMx capture/compare enable register (TIMx_CCER)(x = 2 to 5)</a>, <a href="#">Section 43.4.12: TIMx counter [alternate] (TIMx_CNT)(x = 2 to 5)</a> and <a href="#">Table 318: TIM2/TIM3/TIM4/TIM5 register map and reset values</a>.</p> <p><b>Section 44: General-purpose timers (TIM12/TIM13/TIM14)</b>  Updated <a href="#">Figure 425: General-purpose timer block diagram (TIM12)</a>.  Updated <a href="#">Figure 439: Capture/compare channel 1 main circuit</a> and <a href="#">Figure 440: Output stage of capture/compare channel (channel 1)</a>  Updated <a href="#">Section 44.4.2: TIM12 control register 2 (TIM12_CR2)</a>, <a href="#">Section 44.4.5: TIM12 status register (TIM12_SR)</a> and <a href="#">Section 44.4.6: TIM12 event generation register (TIM12_EGR)</a>. Updated OC1FE description in <a href="#">Section 44.4.7: TIM12 capture/compare mode register 1 [alternate] (TIM12_CCMR1)</a> and <a href="#">Section 44.5.5: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 13 to 14)</a>.</p> <p><b>Section 45: General-purpose timers (TIM15/TIM16/TIM17)</b>  Updated <a href="#">Figure 451: TIM15 block diagram</a> and <a href="#">Figure 452: TIM16/TIM17 block diagram</a> and <a href="#">Figure 466: Capture/compare channel 1 main circuit</a>.  Updated source for break channels in <a href="#">Section 45.4.13: Using the break function</a>.  Updated <a href="#">Figure 476: Break circuitry overview</a>.  Updated <a href="#">Section 45.5.2: TIM15 control register 2 (TIM15_CR2)</a>, <a href="#">Section 45.5.5: TIM15 status register (TIM15_SR)</a>, <a href="#">Section 45.5.9: TIM15 capture/compare enable register (TIM15_CCER)</a>, <a href="#">Section 45.6.2: TIMx control register 2 (TIMx_CR2)(x = 16 to 17)</a>, <a href="#">Section 45.6.4: TIMx status register (TIMx_SR)(x = 16 to 17)</a>, <a href="#">Section 45.6.6: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1) (x = 16 to 17)</a> and <a href="#">Section 45.6.8: TIMx capture/compare enable register (TIMx_CCER)(x = 16 to 17)</a>.  Replaced DT[7:0] by DTG[7:0] in <a href="#">Table 327: TIM15 register map and reset values</a> and <a href="#">Table 329: TIM16/TIM17 register map and reset values</a>. Updated OC1FE description in <a href="#">Section 45.5.8: TIM15 capture/compare mode register 1 [alternate] (TIM15_CCMR1)</a> and <a href="#">Section 45.6.6: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1) (x = 16 to 17)</a>.</p>

**Table 549. Document revision history (continued)**

Date	Revision	Changes
23-Jan-2020	3 (continued)	<p><b>Section 47: Low-power timer (LPTIM)</b> Updated <a href="#">Section 47.4.5: Glitch filter</a>.</p> <p><b>Section 51: Tamper and backup registers (TAMP)</b> Updated <a href="#">Figure 508: TAMP block diagram</a>. Updated <a href="#">Table 361: TAMP internal input/output signals</a> and <a href="#">Table 362: TAMP interconnection</a>. Updated <a href="#">Section : TAMP backup registers</a>. Added: <a href="#">Table 365: TAMP pins functionality over modes</a>.</p> <p><b>Section 52: Inter-integrated circuit (I2C) interface</b> Updated <a href="#">Section 52.3: I2C implementation</a>. Updated <a href="#">Section 52.6: I2C interrupts</a> Updated <a href="#">Section 52.7.2: I2C control register 2 (I2C_CR2)</a>, <a href="#">Section 52.7.3: I2C own address 1 register (I2C_OAR1)</a> and <a href="#">Section 52.7.8: I2C interrupt clear register (I2C_ICR)</a>.</p> <p><b>Section 53: Universal synchronous/asynchronous receiver transmitter (USART/UART)</b> Updated <a href="#">Section 53.5.4: USART FIFOs and thresholds</a>. Changed USART_TDR into USART_RDR in <a href="#">Figure 561: Reception using DMA</a>. Updated RTO bitfield description in <a href="#">Section 53.8.7: USART receiver timeout register (USART_RTOR)</a> register. Changed reset value for FIFO enabled and disabled of <a href="#">Section 53.8.9: USART interrupt and status register (USART_ISR)</a> and <a href="#">Table 393: USART register map and reset values</a>. Changed reset value of <a href="#">USART receive data register (USART_RDR)</a> and <a href="#">USART transmit data register (USART_TDR)</a>. Changed reset value for FIFO enabled and disabled of <a href="#">Section 54.7.9: LPUART interrupt flag clear register (LPUART_ICR)</a> and <a href="#">Table 401: LPUART register map and reset values</a>.</p> <p><b>Section 54: Low-power universal asynchronous receiver transmitter (LPUART)</b> Added <a href="#">Section 54.3: LPUART implementation</a>. Changed LPUART_TDR into LPUART_RDR in <a href="#">Figure 575: Reception using DMA</a>. Updated <a href="#">Section 54.4.4: LPUART FIFOs and thresholds</a>.</p> <p><b>Section 55: Serial peripheral interface (SPI)</b> Updated <a href="#">Table 402: STM32H7A3/7B3/7B0xx SPI features</a>. Updated note below <a href="#">Figure 585: Master and three independent slaves at star topology</a>. Updated <a href="#">Figure 597: Waveform examples</a>. Updated <a href="#">Section 55.11.1: SPI/I2S control register 1 (SPI_CR1)</a>. Updated CRCSIZE[4:0] description in <a href="#">Section 55.11.3: SPI configuration register 1 (SPI_CFG1)</a>.</p>

Table 549. Document revision history (continued)

Date	Revision	Changes
23-Jan-2020	3 (continued)	<p><b>Section 58: Single wire protocol master interface (SWPMI)</b>  Updated <a href="#">Table 430: SWPMI input/output signals connected to package pins or balls</a>.  Replaced SWPSCR of RCC_D2CCIP1R by SWPSEL of RCC_CDCCIP1R in <a href="#">Section 58.3.1: SWPMI block diagram</a>.</p> <p><b>Section 56: Serial audio interface (SAI)</b>  Added <a href="#">Section 56.3: SAI implementation</a>.  Number of Dn and CKn lines made generic in <a href="#">Figure 616: SAI functional block diagram</a>.  Added note to indicate that all Dn and CKn might not be available on all SAI instances below <a href="#">Figure 616: SAI functional block diagram</a>, <a href="#">Table 412: SAI input/output pins</a>.  Updated <a href="#">Figure 625: Start-up sequence</a> and added note related to the fact that <math>F_S</math> and <math>F_{SCK_x}</math> formulas are valid only if <math>NODIV = 1</math>.</p> <p><b>Section 60: Secure digital input/output MultiMediaCard interface (SDMMC)</b>  Added <a href="#">Section 60.2: SDMMC implementation</a>.</p> <p><b>Section 61: Controller area network with flexible data rate (FDCAN)</b>  Updated <a href="#">Section 61.1: Introduction</a>, <a href="#">Section 61.2: FDCAN main features</a>. Added <a href="#">Section 61.3: FDCAN implementation</a>. Added <a href="#">Table 469: CAN triggers</a>.  Updated <a href="#">Figure 703: FDCAN block diagram</a> to remove FDCAN1/2_T/RXFD_MODE signals.  Updated <a href="#">Section : Acceptance filter</a>, <a href="#">Section 61.4.4: Bit timing</a>, <a href="#">Section 61.4.5: Clock calibration on CAN</a>, <a href="#">Section 61.4.6: Application</a>, and <a href="#">Section : Timing of interface signals</a>.  Updated <a href="#">Table 489: Standard message ID filter element</a>, <a href="#">Table 491: Extended message ID filter element</a>, <a href="#">Table 494: Trigger memory element description</a>, <a href="#">Figure 708: Standard message ID filter path</a> and <a href="#">Figure 709: Extended message ID filter path</a>.  Updated <a href="#">Table 489: Standard message ID filter element</a>, <a href="#">Table 491: Extended message ID filter element</a>, <a href="#">Table 494: Trigger memory element description</a>.  Updated <a href="#">Section 61.5.6: FDCAN CC control register (FDCAN_CCCR)</a>, <a href="#">Section 61.5.7: FDCAN nominal bit timing and prescaler register (FDCAN_NBTP)</a>, <a href="#">Section 61.5.12: FDCAN error counter register (FDCAN_ECR)</a>, <a href="#">Section 61.5.15: FDCAN interrupt register (FDCAN_IR)</a>, <a href="#">Section 61.5.15: FDCAN interrupt register (FDCAN_IR)</a>, <a href="#">Section 61.5.18: FDCAN interrupt line enable register (FDCAN_ILE)</a>, <a href="#">Section 61.5.21: FDCAN extended ID filter configuration register (FDCAN_XIDFC)</a>, <a href="#">Section 61.5.37: FDCAN Tx buffer request pending register (FDCAN_TXBRP)</a>, <a href="#">Section 61.6.6: FDCAN TT operation control register (FDCAN_TTOCN)</a> and <a href="#">Section 61.6.18: FDCAN TT trigger select register (FDCAN_TTTS)</a>.  Updated <a href="#">Table 496: FDCAN TT register map and reset values</a> and <a href="#">Table 497: CCU register map and reset values</a>.</p>

**Table 549. Document revision history (continued)**

Date	Revision	Changes
23-Jan-2020	3	<p><b>Section 62: USB on-the-go high-speed (OTG_HS)</b>                      Updated <a href="#">Section 62.2.1: General features</a>.                      Updated <a href="#">Section 62.14.2: OTG interrupt register (OTG_GOTGINT)</a>, <a href="#">Section 62.14.5: OTG reset register (OTG_GRSTCTL)</a>, <a href="#">Section 62.14.6: OTG core interrupt register (OTG_GINTSTS)</a>, <a href="#">Section 62.14.18: OTG host periodic transmit FIFO size register (OTG_HPTXFSIZ)</a>, <a href="#">Section 62.14.22: OTG host frame interval register (OTG_HFIR)</a>, <a href="#">Section 62.14.33: OTG host channel x transfer size register (OTG_HCTSIZx)</a>, <a href="#">Section 62.14.39: OTG device configuration register (OTG_DCFG)</a>, <a href="#">Section 62.14.40: OTG device control register (OTG_DCTL)</a>, <a href="#">Section 62.14.41: OTG device status register (OTG_DSTS)</a>, <a href="#">Section 62.14.42: OTG device IN endpoint common interrupt mask register (OTG_DIEPMSK)</a>, <a href="#">Section 62.14.43: OTG device OUT endpoint common interrupt mask register (OTG_DOEPMSK)</a>, <a href="#">Section 62.14.54: OTG device IN endpoint x control register (OTG_DIEPCTLx)</a>, <a href="#">Section 62.14.61: OTG device OUT endpoint x interrupt register (OTG_DOEPINTx)</a>.</p> <p>Updated <a href="#">Section 62.15.3: Device initialization</a> and <a href="#">Section 62.15.6: Device programming model</a>.</p> <p>Updated <a href="#">Section 62.10: OTG_HS Dynamic update of the OTG_HFIR register</a>.</p> <p><b>Section 64: Debug infrastructure</b>                      Updated <a href="#">ETM CoreSight device architecture register (M7_ETM_DEVARCH)</a>.                      Added revision Z and Y in <a href="#">DBGMCU identity code register (DBGMCU_IDC)</a>.</p>

Table 549. Document revision history (continued)

Date	Revision	Changes
24-Jun-2020	4	<p><b>Section 2: Memory and bus architecture</b> Updated <a href="#">Table 8: Boot modes</a> for BOOT = 1.</p> <p><b>Section 4: Embedded flash memory (FLASH)</b> Changed max voltage to 2.7 V for VDDIO_HSLV and VDDMMC_HSLV in <a href="#">Section 4.4.5: Description of user and system option bytes</a>, <a href="#">Section 4.9.8: FLASH option status register (FLASH_OPTSR_CUR)</a> and <a href="#">Section 4.9.9: FLASH option status register (FLASH_OPTSR_PRG)</a>. Renamed VDD_HSLV into VDDIO_HSLV in <a href="#">Table 21: Option byte organization</a>.</p> <p><b>Table 6: Power control (PWR)</b> In the whole chapter, replaced 'voltage regulator' by 'LDO voltage regulator'. Updated <a href="#">Figure 18: Power control block diagram</a> and <a href="#">Figure 19: Power supply overview</a>. Updated <a href="#">Figure 20: System supply configurations for packages with SMPS</a> to restrict it to devices with SMPS, added note 1 below figure; added <a href="#">Figure 21: System supply configurations for packages without SMPS</a>. Grouped description of regulators and regulator operating modes under <a href="#">Section 6.4.3: Voltage regulators</a>. Modified <a href="#">Section 6.4.4: PWR external supply</a>. Updated <a href="#">Section 6.5.5: Battery voltage thresholds</a>. <b>Section 6.6: Power management:</b> – Updated introduction – Reworked <a href="#">Section 6.6.1: System operating modes</a>. – Updated <a href="#">Figure 34: V<sub>CORE</sub> voltage scaling versus system power modes</a>. – Updated <a href="#">Section 6.6.3: Power control modes</a> including <a href="#">Figure 35: Power-control modes detailed state diagram</a> – Updated <a href="#">Table 34: Supply configuration control</a> and <a href="#">Table 35: Operating mode summary</a>. Replaced Run or Stop by SDRun or SDStop in <a href="#">Table 36: PDDS_SRD and RETDS_CD low-power mode control</a>. <b>Section 6.7: Low-power modes:</b> – Updated introduction. – Updated <a href="#">Section 6.7.2: Controlling peripheral clocks</a>, <a href="#">Section 6.7.3: Entering low-power modes</a>, <a href="#">Section 6.7.4: Exiting from low-power modes</a>. – Renamed section <a href="#">Section 6.7.5</a> into <a href="#">System Run and CSleep modes</a> and updated the whole section. – Suppressed Section CStop mode as well as DStop and DStop2 section. – Added <a href="#">Section 6.7.6: System Autonomous mode</a>. – Updated <a href="#">Section 6.7.7: Stop mode</a> and updated <a href="#">Table 46: GPIO state according to CPU and domain state</a>. – Updated pin assignment for NDSTOP2 in <a href="#">Table 45: Overview of low-power mode monitoring pins</a>. Updated MONEN bit description in <a href="#">PWR control register 2 (PWR_CR2)</a>. Updated PDDS_SRD and RETDS_CD bit description in <a href="#">PWR CPU control register (PWR_CPUCR)</a>.</p>

**Table 549. Document revision history (continued)**

Date	Revision	Changes
24-Jun-2020	4 (continued)	<p><b>Section 7: Low-power SRD domain application example</b>                      Changed section title.                      Updated <i>Figure 40: EXTI, RCC and PWR interconnections</i>.                      Updated <i>Section 7.2.2: Block interactions</i>, <i>Section 7.3.1: Memory retention</i>, <i>Section 7.3.2: Memory-to-peripheral transfer using LPUART1 interface</i> and <i>Section 7.3.3: Overall description of the low-power application example based on LPUART1 transmission</i>.</p> <p><b>Section 8: Reset and clock control (RCC)</b>                      Changed SWP into SWPMI and IOMNGR into OCTOSPIM in the whole section including in the corresponding register bit names.                      Renamed all HDMICECxxx bit registers into CECxxx.                      Changed the following internal clock signal names:                      – pclk into rcc_pclk1 and APB clock by rcc_pclk2.                      – KCK_FMC into fmc_ker_ck.                      – ADCx_CK into adc_ker_ck.                      – UCLK into usart_ker_ck                      – clk_cec into cec_ker_ck                      – I2CCLK into i2c_ker_ck                      – SPDIFRX_CLK into spdifrx_ker_ck                      – com_clk into spi_ker_ck                      – clk_lpt into lptim_ker_ck                      – fdcan_ck into fdcan_ker_ck                      – SWPCLK into swpmi_ker_ck                      – SAI_CK_A/B into sai_a_ker_ck/sai_b_ker_ck.                      Updated <i>Figure 55: Kernel clock distribution for SAIs, DFSDMs and SPDIFRX</i>, <i>Figure 56: Kernel clock distribution for SPIs and SPI/I2S</i>, <i>Figure 57: Kernel clock distribution for I2Cs</i>, <i>Figure 58: Kernel clock distribution for UARTs, USARTs and LPUART1</i>, <i>Figure 59: Kernel clock distribution for LTDC</i>, <i>Figure 60: Kernel clock distribution for SDMMC, OCTOSPI and FMC</i>, <i>Figure 61: Kernel clock distribution for USB<sup>(2)</sup></i>, <i>Figure 62: Kernel clock distribution for ADCs, SWPMI, RNG and FDCANs</i> and <i>Figure 63: Kernel clock distribution for LPTIMs and HDMI-CEC<sup>(2)</sup></i>.                      Updated <i>Section : Restart from system Stop</i> and <i>Section : Restart from system Autonomous mode with CPU domain in DStop/DStop2</i>.                      Updated <i>Section 8.5.9: General clock concept overview</i>. Added Autonomous state in <i>Table 59: System states overview</i>                      Updated LTDCEN bit description in <i>RCC APB3 clock register (RCC_APB3ENR)</i>.</p> <p><b>Section 12: System configuration controller (SYSCFG)</b>                      Changed maximum voltage to 2.7 V in <i>Section 12.3.5: I/O speed in low-voltage mode</i>.                      Replaced VDD_HSLV by VDIOD_HSLV and changed 2.5 V to 2.7 V for all HSLVx bits in <i>SYSCFG compensation cell control/status register (SYSCFG_CCCSR)</i>.</p> <p><b>Section 15: Direct memory access controller (DMA)</b>                      Changed bit 20 of <i>DMA stream x configuration register (DMA_SxCR)</i> from Reserved to TRBUFF.</p>

Table 549. Document revision history (continued)

Date	Revision	Changes
24-Jun-2020	4 (continued)	<p><b>Section 21: Chrom-GRC (GFXMMU)</b> Updated <a href="#">Section 21.3.1: Virtual memory</a>.</p> <p><b>Section 35: Parallel synchronous slave interface (PSSI)</b> Updated <a href="#">Figure 267: PSSI block diagram</a> and <a href="#">Figure 268: Top-level block diagram</a>.</p> <p><b>Section 23: Flexible memory controller (FMC)</b> Updated <a href="#">Section : General transaction rules</a> to clarify the behavior of the FMC when AXI transaction data size is different from the device data width and add the case of unaligned addresses.</p> <p><b>Section 24: Octo-SPI interface (OCTOSPI)</b> Updated <a href="#">Section 24.3: OCTOSPI implementation</a>. Updated EN bit description in <a href="#">Section 24.7.1: OCTOSPI control register (OCTOSPI_CR)</a>.</p> <p><b>Section 27: Analog-to-digital converters (ADC)</b> Updated <a href="#">Section : ADC overrun (OVR, OVRMOD)</a>. Added case of FIFO overflow in <a href="#">Section : Managing conversions without using the DMA and without overrun</a>. Suppressed asynchronous clock delay calibration capability and well as ADC_CALCLKR register.</p> <p><b>Section 36: LCD-TFT display controller (LTDC)</b> Updated <a href="#">Figure 274: LTDC block diagram</a>. Added <a href="#">Section 36.3.2: LTDC pins and internal signals</a>. Updated <a href="#">Figure 276: Layer window programmable parameters</a>.</p> <p><b>Section 39: Cryptographic processor (CRYP)</b> Removed reference to STM32 cryptographic library from <a href="#">Section 39.1: Introduction</a>. Support for single and burst transfers updated in <a href="#">Section 39.2: CRYP main features</a>. Added <a href="#">Section 39.3: CRYP implementation</a>. Extended the following sections to DES and TDES: <a href="#">Section : DES/TDES keying and chaining modes</a> and transfer size in <a href="#">Table 294: Cryptographic processor configuration for memory-to-peripheral DMA transfers</a>, <a href="#">Table 295: Cryptographic processor configuration for peripheral-to-memory DMA transfers</a>. Updated <a href="#">Section 39.5: CRYP interrupts</a>, CRYP_K0LR/K0RR, CRYP_K1LR/K1RR, CRYP_K2LR/K2RR and CRYP_K3LR/K3RR registers.</p> <p><b>Section 40: Hash processor (HASH)</b> Updated hash computation sequence in <a href="#">Section 40.4.5: Message digest computing</a>. Updated HMAC processing sequence in <a href="#">Section : HMAC processing</a>. Updated LKEY bit description and changed INIT bit to “rw” in HASH_CR.</p>

**Table 549. Document revision history (continued)**

Date	Revision	Changes
24-Jun-2020	4 (continued)	<p><b>Section 42: Advanced-control timers (TIM1/TIM8)</b>                      Updated <i>Figure 344: Capture/compare channel 1 main circuit</i>.                      Replaced ECC error by Double ECC error when applicable, including in <i>Figure 358: Break and Break2 circuitry overview</i>.                      Updated <i>Section 42.4.1: TIMx control register 1 (TIMx_CR1)(x = 1, 8)</i>, <i>Section 42.4.2: TIMx control register 2 (TIMx_CR2)(x = 1, 8)</i>, <i>Section 42.4.3: TIMx slave mode control register (TIMx_SMCR)(x = 1, 8)</i>, <i>Section 42.4.7: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 1, 8)</i> and <i>Section 42.4.8: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 1, 8)</i>. Updated <i>Table 312: Output control bits for complementary OCx and OCxN channels with break feature</i>. Updated <i>Section 42.4.20: TIMx break and dead-time register (TIMx_BDTR)(x = 1, 8)</i>.                      Updated <i>BKINP</i> in <i>Section 42.4.26: TIM1 alternate function option register 1 (TIM1_AF1)</i>, <i>BK2INP</i> in <i>Section 42.4.27: TIM1 Alternate function register 2 (TIM1_AF2)</i>, and <i>BKCMP1P/BKCMP2P</i> bit in <i>Section 42.4.28: TIM8 Alternate function option register 1 (TIM8_AF1)</i>.</p> <p><b>Section 43: General-purpose timers (TIM2/TIM3/TIM4/TIM5)</b>                      Updated <i>Figure 375: General-purpose timer block diagram</i>, <i>Figure 401: Capture/Compare channel 1 main circuit</i> and <i>Figure 402: Output stage of Capture/Compare channel (channel 1)</i>.                      Updated <i>Section 43.3.19: Timer synchronization</i>.                      Added <i>Figure 419: Master/slave connection example with 1 channel only timers</i>.                      Updated <i>Section 43.4.2: TIMx control register 2 (TIMx_CR2)(x = 2 to 5)</i>, <i>Section 43.4.7: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1) (x = 2 to 5)</i> and <i>Section 43.4.8: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1) (x = 2 to 5)</i>. Updated <i>Table 317: Output control bit for standard OCx channels</i>.</p> <p><b>Section 44: General-purpose timers (TIM12/TIM13/TIM14)</b>                      Updated <i>Figure 426: General-purpose timer block diagram (TIM13/TIM14)</i>.                      Updated <i>Figure 439: Capture/compare channel 1 main circuit</i>.                      Updated <i>Figure 440: Output stage of capture/compare channel (channel 1)</i>.                      updated <i>Section 44.3.6: PWM input mode (only for TIM12)</i>.                      updated <i>Section 44.3.12: Retriggerable one pulse mode (TIM12 only)</i> title.                      Added <i>Section 44.3.18: Using timer output as trigger for other timers (TIM13/TIM14)</i>.                      Updated <i>Section 44.4.2: TIM12 control register 2 (TIM12_CR2)</i>.                      Updated <i>Section 44.4.8: TIM12 capture/compare mode register 1 [alternate] (TIM12_CCMR1)</i>.                      Updated <i>Table 320: Output control bit for standard OCx channels</i>.                      Updated <i>Section 44.5.6: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 13 to 14)</i>.                      Updated <i>Table 322: Output control bit for standard OCx channels</i>.                      Updated <i>Section 44.5.5: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 13 to 14)</i>.</p>

Table 549. Document revision history (continued)

Date	Revision	Changes
24-Jun-2020	4 (continued)	<p><b>Section 45: General-purpose timers (TIM15/TIM16/TIM17)</b>  Updated <i>Figure 452: TIM16/TIM17 block diagram</i>, <i>Figure 466: Capture/compare channel 1 main circuit</i>, <i>Figure 467: Output stage of capture/compare channel (channel 1)</i>, <i>Figure 468: Output stage of capture/compare channel (channel 2 for TIM15)</i>.  Updated <i>Section 45.4.7: PWM input mode (only for TIM15)</i>.  Updated <i>Section 45.4.17: Retriggerable one pulse mode (TIM15 only)</i> title.  Updated <i>Table 326: Output control bits for complementary OCx and OCxN channels with break feature (TIM15)</i>.  Added <i>Section 45.4.24: Using timer output as trigger for other timers (TIM16/TIM17)</i>.  Updated <i>Section 45.4.24: Using timer output as trigger for other timers (TIM16/TIM17)</i>, <i>Section 45.4.24: Using timer output as trigger for other timers (TIM16/TIM17)</i> and <i>Table 329: TIM16/TIM17 register map and reset values</i>.</p> <p><b>Section 47: Low-power timer (LPTIM)</b>  Updated <i>Section 47.7.4: LPTIM configuration register (LPTIM_CFGR)</i>.</p> <p><b>Section 51: Tamper and backup registers (TAMP)</b>  Updated <i>Table 365: TAMP pins functionality over modes</i>.</p> <p><b>Section 55: Serial peripheral interface (SPI)</b>  Updated <i>Section 55.2: SPI main features</i>, <i>Section 55.3: SPI implementation</i> and <i>Section 55.4.2: SPI signals</i>.  Updated <i>Section 55.4.5: Standard multi-slave communication</i>, <i>Section 55.4.5: Standard multi-slave communication</i>, <i>Section 55.4.7: Slave select (SS) pin management</i>, <i>Section 55.4.8: Communication formats</i>, <i>Section 55.4.9: Configuration of SPI</i>, <i>Section 55.4.10: Procedure for enabling SPI</i> and <i>Section 55.4.11: SPI data transmission and reception procedures</i>.  Updated <i>Figure 593: Packing data in FIFO for transmission and reception</i>  Updated <i>Section 55.5.1: TI mode</i>, <i>Section 55.5.2: SPI error flags</i> and <i>Section 55.5.3: CRC computation</i>.  Updated <i>Section 55.10: I2S wakeup and interrupts</i>.  Updated <i>Section 55.11.1: SPI/I2S control register 1 (SPI_CR1)</i>, <i>Section 55.11.3: SPI configuration register 1 (SPI_CFG1)</i>, <i>Section 55.11.4: SPI configuration register 2 (SPI_CFG2)</i>, <i>Section 55.11.6: SPI/I2S status register (SPI_SR)</i>, <i>Section 55.11.8: SPI/I2S transmit data register (SPI_TXDR)</i>, <i>Section 55.11.8: SPI/I2S transmit data register (SPI_TXDR)</i>, <i>Section 55.11.10: SPI polynomial register (SPI_CRCPOLY)</i>, <i>Section 55.11.11: SPI transmitter CRC register (SPI_TXCRC)</i>.  Updated <i>Section 55.11.12: SPI receiver CRC register (SPI_RXCRC)</i> and <i>Section 55.11.13: SPI underrun data register (SPI_UDRDR)</i>.</p> <p><b>Section 58: Single wire protocol master interface (SWPMI)</b>  Modified name of bit and register to select SWPMI in note below <i>Figure 656: SWPMI block diagram</i>.</p>

**Table 549. Document revision history (continued)**

Date	Revision	Changes
24-Jun-2020	4 (continued)	<p><b>Section 62: USB on-the-go high-speed (OTG_HS)</b>                      Updated <i>Section 62.2.1: General features</i>, <i>Section 62.3: OTG_HS implementation</i> and <i>Section 62.4.3: OTG_HS core</i>.                      Updated <i>Section 62.4.4: Embedded full-speed OTG PHY connected to OTG_HS</i>.                      Added <i>Section 62.4.5: OTG detections</i>.                      Added/updated <i>Figure 720: OTG_HS A-B device connection</i> and <i>Figure 721: OTG_HS peripheral-only connection</i>.</p> <p><b>Section 64: Debug infrastructure</b>                      Removed revision Y and added revision X in <i>DBGMCU identity code register (DBGMCU_IDC)</i>.</p>

Table 549. Document revision history (continued)

Date	Revision	Changes
19-Oct-2020	5	<p><b>Section 2: Memory and bus architecture</b> Updated <i>Section : Embedded bootloader.</i></p> <p><b>Section 4: Embedded flash memory (FLASH)</b> Removed seven wait states from <i>Table 16: FLASH recommended number of wait states and programming delay.</i></p> <p><b>Section 6: Power control (PWR)</b> Updated <i>Figure 20: System supply configurations for packages with SMPS.</i></p> <p><b>Section 10: Hardware semaphore (HSEM)</b> Modified <i>Table 69: HSEM internal input/output signals.</i> Updated <i>Section 10.3.3: HSEM lock procedures, Section 10.3.4: HSEM write/read/read lock register address, Section 10.3.5: HSEM unlock procedures, Section 10.3.6: HSEM MASTERID semaphore clear and Section 10.3.7: HSEM interrupts.</i></p> <p><b>Section 18: Chrom-Art Accelerator controller (DMA2D)</b> Updated <i>Table 110: DMA2D internal input/output signals.</i></p> <p><b>Section 24: Octo-SPI interface (OCTOSPI)</b> Extended CSHT timeout is not supported. Updated all block diagrams. Renamed nCS and CS pin names into NCS, and nCLK into NCLK. Renamed DDR into DTR. Renamed Status-polling into Automatic status-polling. Add <i>Section 24.5: Address alignment and data number.</i> Renamed FSEL bit into MSEL and DQM bit into DMM in OCTOSPI_CR register.</p> <p><b>Section 26: Delay block (DLYB)</b> Updated <i>Section 26.3.4: Delay line length configuration procedure and Section 26.3.5: Output clock phase configuration procedure.</i></p> <p><b>Section 39: Cryptographic processor (CRYP)</b> Updated <i>Figure 284: AES-ECB mode overview, Figure 285: AES-CBC mode overview, Figure 286: AES-CTR mode overview, Figure 287: AES-GCM mode overview, Figure 288: AES-GMAC mode overview, Figure 289: AES-CCM mode overview, Figure 299: Message construction for the Counter mode, Figure 302: Message construction for the Galois/counter mode, Figure 303: Message construction for the Galois Message Authentication Code mode.</i> Updated <i>Table 284: Counter mode initialization vector, Table 286: GCM mode IV registers initialization, Table 287: CCM mode IV registers initialization.</i> Updated <i>Section 39.4.16: CRYP data registers and data swapping, Section 39.4.17: CRYP key registers, Section 39.4.18: CRYP initialization vector registers and Section 39.6: CRYP processing time.</i> Updated all CRYP_KxLR/RR and CRYP_IVxLR/RR register descriptions.</p>

**Table 549. Document revision history (continued)**

Date	Revision	Changes
19-Oct-2020	5 (continued)	<p><b>Section 55: Serial peripheral interface (SPI)</b>  Updated <a href="#">Section 55.2: SPI main features</a>, <a href="#">Table 402: STM32H7A3/7B3/7B0xx SPI features</a> and <a href="#">Section 55.4.2: SPI signals</a>.  Updated <a href="#">Section 55.4.5: Standard multi-slave communication</a>, <a href="#">Section 55.4.7: Slave select (SS) pin management</a>, <a href="#">Section 55.4.8: Communication formats</a>, <a href="#">Section 55.4.9: Configuration of SPI</a>, <a href="#">Section 55.4.10: Procedure for enabling SPI</a> and <a href="#">Section 55.4.11: SPI data transmission and reception procedures</a>.  Modified <a href="#">Figure 593: Packing data in FIFO for transmission and reception</a>.  Updated <a href="#">Section 55.5.1: TI mode</a>, <a href="#">Section 55.5.2: SPI error flags</a> and <a href="#">Section 55.5.3: CRC computation</a>.  Updated <a href="#">Section 55.7: SPI wakeup and interrupts</a>.  Updated <a href="#">Section 55.11.1: SPI/I2S control register 1 (SPI_CR1)</a>, <a href="#">Section 55.11.3: SPI configuration register 1 (SPI_CFG1)</a>, <a href="#">Section 55.11.4: SPI configuration register 2 (SPI_CFG2)</a>, <a href="#">Section 55.11.6: SPI/I2S status register (SPI_SR)</a>, <a href="#">Section 55.11.8: SPI/I2S transmit data register (SPI_TXDR)</a>, <a href="#">Section 55.11.9: SPI/I2S receive data register (SPI_RXDR)</a>, <a href="#">Section 55.11.10: SPI polynomial register (SPI_CRCPOLY)</a>, <a href="#">Section 55.11.11: SPI transmitter CRC register (SPI_TXCRC)</a>, <a href="#">Section 55.11.12: SPI receiver CRC register (SPI_RXCRC)</a>, <a href="#">Section 55.11.13: SPI underrun data register (SPI_UDRDR)</a>, and <a href="#">Section 55.12: SPI register map and reset values</a>.</p> <p><b>Section 60: Secure digital input/output MultiMediaCard interface (SDMMC)</b>  Updated <a href="#">Section : Data path</a> and <a href="#">Section : Data FIFO</a></p> <p><b>Section 61: Controller area network with flexible data rate (FDCAN)</b>  Updated <a href="#">Section 61.5.7: FDCAN nominal bit timing and prescaler register (FDCAN_NBTP)</a>.  Added <a href="#">Section 61.5.47: FDCAN register map and reset values</a> and <a href="#">Section 61.6.19: FDCAN TT register map and reset values</a>.</p> <p><b>Section 62: USB on-the-go high-speed (OTG_HS)</b>  Restored ODDFRM bit in OTG_HCCHARx registers.</p> <p><b>Section 64: Debug infrastructure</b>  Updated <a href="#">Section 64.5.1: System ROM tables</a>.  Changed TDESIGNER[11:0] to TDESIGNER[10:0] in DP_TARGETSEL <a href="#">Debug port target identification register (DP_TARGETSEL)</a>.  Updated IDCODE in <a href="#">Table 524: JTAG-DP data registers</a>.  Updated reset value and revision in <a href="#">Access port identification register (AP_IDR)</a>.  Updated <a href="#">Table 527: System ROM table 1</a> and <a href="#">Table 528: System ROM table 2</a>.  Modified <a href="#">Figure 766: APB-D CoreSight component topology</a>.  Updated <a href="#">SYSROM CoreSight peripheral identity register 0 (SYSROM_PIDR0)</a> and <a href="#">SYSROM CoreSight peripheral identity register 1 (SYSROM_PIDR1)</a>.  Added <a href="#">Table 530: System ROM table 2 register map and reset values</a>.  Updated <a href="#">CTI CoreSight peripheral identity register 2 (CTI_PIDR2)</a> and <a href="#">CSTF CoreSight peripheral identity register 2 (CSTF_PIDR2)</a>.  Updated <a href="#">ETF RAM size register (ETF_RSZ)</a> and <a href="#">ETF CoreSight peripheral identity register 2 (ETF_PIDR2)</a>.</p>

Table 549. Document revision history (continued)

Date	Revision	Changes
19-Oct-2020	5 (continued)	<p><b>Section 64: Debug infrastructure (continued)</b></p> <p>Updated <i>TPIU supported port size register (TPIU_SUPPSIZE)</i>, <i>TPIU formatter and flush status register (TPIU_FFSR)</i> and <i>TPIU CoreSight peripheral identity register 2 (TPIU_PIDR2)</i>. Updated <i>SWO CoreSight peripheral identity register 2 (SWO_PIDR2)</i>. Updated <i>DBGMCU configuration register (DBGMCU_CR)</i>.</p> <p>Modified <i>Table 541: Cortex-M7 CPU ROM table</i> and <i>Figure 770: Cortex-M7 CoreSight Topology</i>.</p> <p>Updated <i>CPU ROM CoreSight peripheral identity register 4 (M7_CPUROM_PIDR4)</i>, <i>CPU ROM CoreSight peripheral identity register 0 (M7_CPUROM_PIDR0)</i>, <i>CPU ROM CoreSight peripheral identity register 1 (M7_CPUROM_PIDR1)</i> and <i>PPB ROM CoreSight peripheral identity register 0 (M7_PPBR0M_PIDR0)</i></p> <p>Updated <i>DWT CoreSight peripheral identity register 1 (M7_DWT_PIDR1)</i> and <i>DWT CoreSight peripheral identity register 2 (M7_DWT_PIDR2)</i>.</p> <p>Updated <i>ITM CoreSight peripheral identity register 2 (M7_ITM_PIDR2)</i>.</p> <p>Updated <i>FPB CoreSight peripheral identity register 0 (M7_FPB_PIDR0)</i> and <i>FPB CoreSight peripheral identity register 2 (M7_FPB_PIDR2)</i>.</p> <p>Updated <i>ETM CoreSight peripheral identity register 2 (M7_ETM_PIDR2)</i>.</p>
31-May-2021	6	<p>Added errata sheet in the list of reference documents as well as mention that patents apply to the microcontrollers on document cover page.</p> <p><b>Section 4: Embedded flash memory (FLASH)</b></p> <p><i>Section : Erase operation overview</i>: removed mention that bank 2 can be erased by ST secure firmware; added note related to the case where data cache is enabled after erase operations.</p> <p>Changed reset value of FLASH_OPTSR bit 26 and 28 to X in <i>Table 21: Option byte organization</i>.</p> <p>Added note providing non-secure Flash area start address in SEC_AREA_END1 of <i>Section 4.9.13: FLASH secure address for bank 1 (FLASH_SCAR_CUR1)</i>.</p> <p>Added formula to deduce bank 1/2 fail address from FAIL_ECC_ADDR1/2 in <i>Section 4.9.23: FLASH ECC fail address for bank 1 (FLASH_ECC_FA1R)</i> and <i>Section 4.9.39: FLASH ECC fail address for bank 2 (FLASH_ECC_FA2R)</i>, respectively.</p> <p><b>Section 6: Power control (PWR)</b></p> <p>Moved LSI from Backup to VDD domain in <i>Figure 19: Power supply overview</i>.</p> <p><b>Section 8: Reset and clock control (RCC)</b></p> <p>Updated <i>Figure 50: HSI calibration flow</i> and <i>Figure 55: Kernel clock distribution for SAIs, DFSDMs and SPDIFRX</i>.</p> <p><b>Section 11: General-purpose I/Os (GPIO)</b></p> <p>Changed default configuration at reset from 00 to 11 in <i>Section 11.4.1: GPIO port mode register (GPIOx_MODER) (x =A to K)</i>.</p> <p><b>Section 24: Octo-SPI interface (OCTOSPI)</b></p> <p>Renamed MSEL bit into FSEL in Updated <i>Section 24.7.1: OCTOSPI control register (OCTOSPI_CR)</i>.</p>

Table 549. Document revision history (continued)

Date	Revision	Changes
31-May-2021	6 (continued)	<p><b>Section 25: OCTOSPI I/O manager (OCTOSPIM)</b>  Added <a href="#">Table 182: OCTOSPIM implementation</a>.  Updated <a href="#">Section 25.4.4: OCTOSPIM multiplexed mode</a>.</p> <p><b>Section 28: Digital temperature sensor (DTS)</b>  Changed definition of TS1_T0[1:0]=01 in <a href="#">Section 28.6.2: Temperature sensor T0 value register 1 (DTS_T0VALR1)</a>.</p> <p><b>Section 29: Digital-to-analog converter (DAC)</b>  Updated transfer function formula in <a href="#">Section 29.4.13: Dual DAC channel conversion modes (if dual channels are available)</a>.</p> <p><b>Section 38: True random number generator (RNG)</b>  Updated <a href="#">Section 38.5: RNG processing time</a>.</p> <p><b>Section 47: Low-power timer (LPTIM)</b>  Updated <a href="#">Section 47.2: LPTIM main features</a> and <a href="#">Section 47.4.4: LPTIM reset and clocks</a>.  Added note to <a href="#">Section 47.4.7: Trigger multiplexer</a>.</p> <p><b>Section 50: Real-time clock (RTC)</b>  Updated <a href="#">Section 50.3.13: RTC smooth digital calibration</a>.  Updated <a href="#">Section 50.6.4: RTC initialization control and status register (RTC_ICSR)</a> and <a href="#">Section 50.6.20: RTC status clear register (RTC_SCR)</a>.</p> <p><b>Section 53: Universal synchronous/asynchronous receiver transmitter (USART/UART)</b>  Renamed SCLK pin to CK in the whole document.  Added wakeup from Stop in <a href="#">Section 53.2: USART main features</a>.  Added <a href="#">Section 53.6: USART in low-power modes</a>.  Updated <a href="#">Section 53.7: USART interrupts</a>.  Updated ADD[7:0] bitfield descriptions in <a href="#">Section 53.8.3: USART control register 2 (USART_CR2)</a>.  Updated ABRRQ bit description in <a href="#">Section 53.8.8: USART request register (USART_RQR)</a>.  Updated ABRE and EOBFF bit descriptions of <a href="#">Section 53.8.9: USART interrupt and status register (USART_ISR)</a>.</p> <p><b>Section 54: Low-power universal asynchronous receiver transmitter (LPUART)</b>  Renamed SCLK pin to CK in the whole document.  Updated <a href="#">Table 395: Error calculation for programmed baud rates at lpuart_ker_ck_pres = 32.768 kHz</a>.  Added <a href="#">Section 54.5: LPUART in low-power modes</a>.  Updated <a href="#">Section 54.6: LPUART interrupts</a>.  Updated ADD[7:0] bitfield descriptions in <a href="#">Section 54.7.3: LPUART control register 2 (LPUART_CR2)</a>.  Updated ABRE bit descriptions of <a href="#">Section 54.7.7: LPUART interrupt and status register (LPUART_ISR)</a>.</p>

Table 549. Document revision history (continued)

Date	Revision	Changes
31-May-2021	6 (continued)	<p><b>Section 56: Serial audio interface (SAI)</b>            Added reference to implementation section in <a href="#">Section 56.4.10: PDM interface</a>.            In <a href="#">Section 56.4.12: SPDIF output</a>, replaced <math>F_{SAI\_CK\_x}</math> by <math>F_{sai\_x\_ker\_ck}</math> in the bit rate formula; added note 2 in <a href="#">Table 417: TDM frame configuration examples</a>.            Added note related to bitfield usage depending on Dx line availability in <a href="#">Section 56.6.19: SAI PDM delay register (SAI_PDMDLY)</a>.</p> <p><b>Section 57: SPDIF receiver interface (SPDIFRX)</b>            Added note in about RCC capabilities in <a href="#">Table 426: Minimum spdifrx_ker_ck frequency versus audio sampling rate</a>.</p> <p><b>Section 62: USB on-the-go high-speed (OTG_HS)</b>            Updated access types for:            – REMWAKE + BESL[3:0] in <a href="#">Section 62.14.17: OTG core LPM configuration register (OTG_GLPMCFG)</a>,            – STALL in <a href="#">Section 62.14.64: OTG device OUT endpoint x control register (OTG_DOEPTLx)</a> and            – RXDPID(r) / TUPCNT[1:0] in <a href="#">Section 62.14.66: OTG power and clock gating control register (OTG_PCGCCTL)</a>.</p>
10-Dec-2021	7	<p><b>Section 2: Memory and bus architecture</b>            Added <a href="#">Table 6: Memory map and default device memory area attributes</a> in <a href="#">Section 2.3.2: Memory map and register boundary addresses</a>.</p> <p><b>Section 4: Embedded flash memory (FLASH)</b>            Updated <a href="#">Table 26: Effect of low-power modes on the embedded flash memory</a>.</p> <p><b>Section 6: Power control (PWR)</b>            Updated <a href="#">Section : Startup with <math>V_{CORE}</math> provided from an external supply (Bypass)</a> and added <a href="#">Section : How to exit from Run* mode</a>.            Modified <a href="#">PWR SmartRun domain control register (PWR_SRDCR)</a> reset value.</p> <p><b>Section 17: DMA request multiplexer (DMAMUX)</b>            Updated <a href="#">Table 102: DMAMUX1: assignment of trigger inputs to resources</a> and <a href="#">Table 103: DMAMUX1: assignment of synchronization inputs to resources</a>.</p> <p><b>Section 22: Cyclic redundancy check calculation unit (CRC)</b>            Renamed GPDR bits names to IDR bits in <a href="#">CRC independent data register (CRC_IDR)</a>.</p> <p><b>Section 24: Octo-SPI interface (OCTOSPI)</b>            Updated <a href="#">Figure 136: OCTOSPI block diagram in octal configuration</a>, <a href="#">Figure 137: OCTOSPI block diagram in quad configuration</a> and <a href="#">Figure 138: OCTOSPI block diagram in dual-quad configuration</a>.            Updated <a href="#">Section 24.4.3: OCTOSPI Regular-command protocol</a>, <a href="#">Section 24.4.5: HyperBus protocol</a>, <a href="#">Section : Memory-mapped mode configuration</a> and <a href="#">Section 24.4.19: NCS behavior</a>.            Updated description of FRCK in <a href="#">OCTOSPI device configuration register 1 (OCTOSPI_DCR1)</a> and REFRESH[31:0] in <a href="#">OCTOSPI device configuration register 4 (OCTOSPI_DCR4)</a>.</p>

**Table 549. Document revision history (continued)**

Date	Revision	Changes
10-Dec-2021	7 (continued)	<p><b>Section 25: OCTOSPI I/O manager (OCTOSPIM)</b>                      Renamed OCTOSPI<sub>n</sub>_nCS signal into OCTOSPI<sub>n</sub>_NCS in the whole section.                      Updated <a href="#">Figure 153: OCTOSPIM block diagram</a>, <a href="#">Section 25.1: Introduction</a>, <a href="#">Section 25.2: OCTOSPIM main features</a>, <a href="#">Section 25.3: OCTOSPIM implementation</a>, <a href="#">Section 25.4.3: OCTOSPIM matrix</a> and <a href="#">Section 25.4.4: OCTOSPIM multiplexed mode</a>.</p> <p><b>Section 27: Analog-to-digital converters (ADC)</b>                      Remove ADC supply requirements from <a href="#">Table 189: ADC input/output pins</a>.                      Added <a href="#">Section : Constraints between ADC clocks</a>.                      Replaced ADC<sub>x</sub>_CCR by ADC<sub>x</sub>_CDR in <a href="#">Section : Regular simultaneous mode with independent injected</a>.                      Updated <a href="#">Figure 188: Example of overrun (OVRMOD = 0)</a>, <a href="#">Figure 194: AUTDLY=1 in auto-injected mode (JAUTO=1)</a>, <a href="#">Figure 203: Regular and injected oversampling modes used simultaneously</a>, and <a href="#">Figure 204: Triggered regular oversampling with injection</a>.                      Update maximum junction temperature to 125 °C in <a href="#">Section 27.4.33: Temperature sensor</a>.<a href="#">Section 27.4.33: Temperature sensor</a>; updated temperature calculation formula in <a href="#">Section : Reading the temperature</a>.</p> <p><b>Section 28: Digital temperature sensor (DTS)</b>                      Modified <a href="#">Figure 225: Temperature sensor functional block diagram</a>.                      Updated signal names to which ts1_trg0 to 3 are connected in <a href="#">Table 210: Trigger configuration</a>.                      Updated TS1_LITTHD[15:0] bitfield description in <a href="#">Temperature sensor interrupt threshold register 1 (DTS_ITR1)</a>.</p> <p><b>Section 29: Digital-to-analog converter (DAC)</b>                      Added VREF+ pin availability in <a href="#">Table 29.2: DAC main features</a>.</p> <p><b>Section 30: Voltage reference buffer (VREFBUF)</b>                      Updated <a href="#">Section 30.2: VREFBUF functional description</a>.</p> <p><b>Section 33: Digital filter for sigma delta modulators (DFSDM)</b>                      Updated <a href="#">Table 245: DFSDM triggers connection</a>.</p> <p><b>Section 38: True random number generator (RNG)</b>                      Modified step 3 of <a href="#">Section : Health checks</a>.                      Updated <a href="#">Table 281: RNG configurations</a>.</p> <p><b>Section 42: Advanced-control timers (TIM1/TIM8)</b>                      Updated <a href="#">Figure 338: Control circuit in normal mode, internal clock divided by 1</a>. Added Note in <a href="#">Section 42.3.16: Using the break function</a>.                      Updated OC1PE in <a href="#">Section 42.4.8: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 1, 8)</a>.</p> <p><b>Section 43: General-purpose timers (TIM2/TIM3/TIM4/TIM5)</b>                      Renamed DBGMCU into DBG in <a href="#">Section 43.3.21: Debug mode</a>.                      Added Note to CC4DE bitfield in <a href="#">Section 43.4.4: TIMx DMA/Interrupt enable register (TIMx_DIER)(x = 2 to 5)</a>.</p>

**Table 549. Document revision history (continued)**

Date	Revision	Changes
10-Dec-2021	7 (continued)	<p><b>Section 44: General-purpose timers (TIM12/TIM13/TIM14)</b>                      Updated <i>Figure 437: Control circuit in external clock mode 1</i>.                      Updated OC1PE in <i>Section 44.4.8: TIM12 capture/compare mode register 1 [alternate] (TIM12_CCMR1)</i> and <i>Section 44.5.6: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 13 to 14)</i>.</p> <p><b>Section 45: General-purpose timers (TIM15/TIM16/TIM17)</b>                      Updated <i>Figure 462: Control circuit in normal mode, internal clock divided by 1</i>.                      Added Note in <i>Section 45.4.13: Using the break function</i>. Added <i>Section 45.4.15: 6-step PWM generation</i>.                      Updated <i>Section 45.5.8: TIM15 capture/compare mode register 1 [alternate] (TIM15_CCMR1)</i> and <i>Section 45.6.7: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1) (x = 16 to 17)</i>.</p> <p><b>Section 52: Inter-integrated circuit (I2C) interface</b>                      Updated <i>Figure 521: Transfer bus diagrams for I2C slave receiver (mandatory events only)</i>.</p> <p><b>Section 53: Universal synchronous/asynchronous receiver transmitter (USART/UART)</b>                      Replaced nCTS and nRTS by CTS and RTS in the whole section.</p> <p><b>Section 54: Low-power universal asynchronous receiver transmitter (LPUART)</b>                      Replaced nCTS and nRTS by CTS and RTS in the whole section.</p> <p><b>Section 57: SPDIF receiver interface (SPDIFRX)</b>                      Updated <i>Section 57.3: SPDIFRX functional description</i> including <i>Figure 638: SPDIFRX block diagram</i>, <i>Figure 643: SPDIFRX decoder</i>, and <i>Figure 644: Noise filtering and edge detection</i>. Modified <i>SPDIFRX control register (SPDIFRX_CR)</i>.</p> <p><b>Section 61: Controller area network with flexible data rate (FDCAN)</b>                      Replaced Host with user throughout the whole document.                      Updated <i>Section : Operating conditions</i>, <i>Section : Clock calibration bypassed</i>, <i>Section : Software calibration</i>, <i>Section : Clock calibration active</i> and <i>Calibration configuration register (FDCAN_CCUCCFG)</i>.</p> <p><b>Section 62: USB on-the-go high-speed (OTG_HS)</b>                      Removed Table TRDT values for FS mode (not supported).</p>

Table 549. Document revision history (continued)

Date	Revision	Changes
11-Jan-2022	8	<p><b>Section 2: Memory and bus architecture</b> Updated <a href="#">Table 6: Memory map and default device memory area attributes</a>.</p> <p><b>Section 5: Secure memory management (SMM)</b> Added introduction to RSSS in <a href="#">Section 5.4: Root secure services (RSS)</a>.</p> <p><b>Section 6: Power control (PWR)</b> Added note to bits 7 to 0 of <a href="#">PWR control register 3 (PWR_CR3)</a>. Added note to bits 15:14 of <a href="#">PWR SmartRun domain control register (PWR_SRDCR)</a>.</p> <p><b>Section 24: Octo-SPI interface (OCTOSPI)</b> Added new note after <a href="#">Figure 141</a>, <a href="#">Figure 142</a>, and <a href="#">Figure 143</a>. Updated <a href="#">Quad-SPI mode</a>, and <a href="#">Octal-SPI mode</a>. Updated note at the beginning of <a href="#">Section 24.4.10: OCTOSPI Memory-mapped mode</a>. Updated <a href="#">Table 179: Address alignment cases</a>. Updated DEVSIZ description in <a href="#">OCTOSPI device configuration register 1 (OCTOSPI_DCR1)</a> and REFRESH description in <a href="#">OCTOSPI device configuration register 4 (OCTOSPI_DCR4)</a>.</p>

Table 549. Document revision history (continued)

Date	Revision	Changes
18-May-2022	9	<p><b>Section 2: Memory and bus architecture</b>            In <i>Section 2.6: Boot configuration</i>, updated system bootloader address in <i>Table 8: Boot modes</i>.</p> <p><b>Section 8: Reset and clock control (RCC)</b>            Updated debug clock and signals in <i>Figure 47: Top-level clock tree</i>.            Renamed traceclk into traceportck in SW[2:0] of <i>RCC clock configuration register (RCC_CFGR)</i>.</p> <p><b>Section 18: Chrom-Art Accelerator controller (DMA2D)</b>            Updated maximum number of color formats to 12 in <i>Section 18.2: DMA2D main features</i>. Updated <i>Section 18.3.1: General description</i>.            Updated list of DMA2D modes in <i>Section 18.3.13: DMA2D configuration</i>.            Modified <i>DMA2D output color register (DMA2D_OCOLR)</i> and added alternate descriptions.</p> <p><b>Section 21: Chrom-GRC (GFXMMU)</b>            Updated <i>Section : Master accessing the GFXMMU</i>.</p> <p><b>Section 25: OCTOSPI I/O manager (OCTOSPIM)</b>            Added <i>Section 25.4.2: OCTOSPIM input/output pins</i>.</p> <p><b>Section 27: Analog-to-digital converters (ADC)</b>            Updated formula to calculate the temperature in <i>Section : Reading the temperature</i>.</p> <p><b>Section 37: JPEG codec (JPEG)</b>            Added <i>JPEG Huffman min (JPEG_HUFFMINx_y)</i></p> <p><b>Section 39: Cryptographic processor (CRYP)</b>            Added GCM/CCM hardware padding capability in <i>Section : Appending data using the CPU in Polling mode</i>, <i>Section : Appending data using the CPU in Interrupt mode</i> and <i>Section : Appending data using the DMA</i>, as well as NPBLB[3:0] bitfield in <i>CRYP control register (CRYP_CR)</i>.            Updated step 1 of the key preparation sequence in <i>Section 39.4.7: Preparing the CRYP AES key for decryption</i>.            Updated KERF description in <i>Section 39.7.2: CRYP status register (CRYP_SR)</i>.            Updated <i>Section 39.7.5: CRYP DMA control register (CRYP_DMACR)</i>, <i>Section 39.7.8: CRYP masked interrupt status register (CRYP_MISR)</i>.            Renamed IV bitfields of <i>CRYP initialization vector register 0L (CRYP_IV0LR)/CRYP initialization vector register 0R (CRYP_IV0RR)</i> and <i>CRYP initialization vector register 1L (CRYP_IV1LR)/CRYP initialization vector register 1R (CRYP_IV1RR)</i> to IVI. In the whole document, renamed CRPY_IVxR and CRPY_IVxL into CRPY_IVxRR and CRPY_IVxLR, respectively.</p>

**Table 549. Document revision history (continued)**

Date	Revision	Changes
18-May-2022	9 (continued)	<p><b>Section 38: True random number generator (RNG)</b>  Updated <a href="#">Section 38.5: RNG processing time</a>.  Modified CONFIGLOCK bit description in <a href="#">RNG control register (RNG_CR)</a>.</p> <p><b>Section 51: Tamper and backup registers (TAMP)</b>  Updated <a href="#">Section 51.6.1: TAMP control register 1 (TAMP_CR1)</a>.</p> <p><b>Section 52: Inter-integrated circuit (I2C) interface</b>  Updated <a href="#">Hardware transfer management</a>.  Updated <a href="#">Figure 521: Transfer bus diagrams for I2C slave receiver (mandatory events only)</a>, <a href="#">Figure 518: Transfer bus diagrams for I2C slave transmitter (mandatory events only)</a>, <a href="#">Figure 528: Transfer bus diagrams for I2C master transmitter (mandatory events only)</a>, and <a href="#">Figure 531: Transfer bus diagrams for I2C master receiver (mandatory events only)</a>.</p> <p><b>Section 57: SPDIF receiver interface (SPDIFRX)</b>  Updated <a href="#">Section 57.3: SPDIFRX functional description</a>.</p> <p><b>Section 60: Secure digital input/output MultiMediaCard interface (SDMMC)</b>  Updated <a href="#">Section : Data FIFO</a>, <a href="#">Section : Stream operation and CMD12</a>, <a href="#">Section : Block operation and CMD12</a>, <a href="#">Section : Normal boot operation</a>, and <a href="#">Section : Alternative boot operation</a>.  Added footnote to <a href="#">Table 442: SDMMC operation modes eMMC</a>.</p> <p><b>Section 64: Debug infrastructure</b>  Renamed TRACECK into TRACECLK in <a href="#">Figure 760: Block diagram of debug infrastructure</a>, <a href="#">Figure 761: Power domains of debug infrastructure</a>, <a href="#">Figure 64.5.5: Trace port interface unit (TPIU)</a> and TRACECLKEN bit description of <a href="#">DBGMCU configuration register (DBGMCU_CR)</a>. Updated <a href="#">Section : Clock domains</a>.  Replaced TRACECLKIN by TRACEPORTCK in <a href="#">TPIU test pattern repeat counter register (TPIU_TPRCR)</a>, <a href="#">TPIU device configuration register (TPIU_DEVID)</a> and <a href="#">SWO device configuration register (SWO_DEVID)</a>.  Changed TRACEPORTCK division factor to PRESCALER+1 in PRESCALER[12:0] of <a href="#">SWO current output divisor register (SWO_CODR)</a>.</p> <p>Added <a href="#">Section 66: Important security notice</a>.</p>

**IMPORTANT NOTICE – READ CAREFULLY**

STMicroelectronics NV and its subsidiaries (“ST”) reserve the right to make changes, corrections, enhancements, modifications, and improvements to ST products and/or to this document at any time without notice. Purchasers should obtain the latest relevant information on ST products before placing orders. ST products are sold pursuant to ST’s terms and conditions of sale in place at the time of order acknowledgment.

Purchasers are solely responsible for the choice, selection, and use of ST products and ST assumes no liability for application assistance or the design of purchasers’ products.

No license, express or implied, to any intellectual property right is granted by ST herein.

Resale of ST products with provisions different from the information set forth herein shall void any warranty granted by ST for such product.

ST and the ST logo are trademarks of ST. For additional information about ST trademarks, refer to [www.st.com/trademarks](http://www.st.com/trademarks). All other product or service names are the property of their respective owners.

Information in this document supersedes and replaces information previously supplied in any prior versions of this document.
